TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 a.m. *on Tuesday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

ABERYSTWYTH.—For repairs to Plasdeg House, for the Aberystwyth Corporation. Mr. Rees Jones, Borough Surveyor. Quantities by the Borough Surveyor —

T. Jenkins & Sons	£65 0	T. Evans, Contractor, 11, Vaenor street	£53 15

LABOUR QUESTIONS AND NATIONALISATION AND INSURANCE.

THE Labour Party moved an amendment to the Address in which was embraced not only t quack panacea for all ills, a statutory imum wage, but also a resolution for nationalisation of "railways, mines, and other monopolies." As has been the case when this latter part of the resolution has been brought before the Trade Union Congress during the past ten years, no attempt was made to justify the motion or to show how nationalisation is to be effected, or how it would affect the wage-earners; the resolution was simply left to speak for itself, serious argument being impossible. The most significant remark in the whole debate was indeed a wholly irrelevant observation

by Mr. Keir Hardie, that as soon as the Insurance Act came into force there would be a universal agitation among the working classes for an extra fourpence a week on their wages to enable them to pay their contributions, which would thus be put upon the employers. This is precisely the attitude which we have always predicted would be assumed by the working classes towards this Act, and it is worthy of attention. In those trades where unemployment insurance is also introduced the contributions of employer and employed will amount to 1s., and if national strikes are likely to be resorted to in order to place the whole of this burden on employers, or if there is even a remote risk of such consequences, the Act on this single ground stands condemned.

In the present agitation in all industries for increased wages the ground put forward for an artificial interference with wages is the rise in the necessities of life; and both, or all, parties in the State profess to recognise some reason in the demand based upon this cause. We venture to suggest that when this cause alone is put forward and accepted the real question is, in fact, being begged, and it is necessary to go further back and inquire what is the cause of the increased cost of living? The answer to this question is, at any rate in part, simple, as the increased cost of living is, to some extent, due to the remedial legislation and the increased taxation that has marked the past decade. The extension of the Factory Acts in 1901, the introduction of Workmen's Compensation in 1897 and its great extension in 1906, and the institution of Old Age Pensions in 1908 would alone suffice to raise the cost of production, and coupled with this the new taxes on land and buildings has tended to increase rents and the cost of house property. The working classes call for remedial legislation, but fail to recognise the cost and its inevitable final incidence upon themselves. Take the Insurance Act. It is assumed by its advocates that for a contribution of fourpence the workman will obtain a handsome *quid pro quo*, represented not only by the contributions of the employers and the State, but by greater security and comfort. The employers' and the State's contributions cannot however be provided out of nothing, and a rise of the price of commodities will ensue. Put the whole of the contributions on the employers and the rise will be greater; increase wages, and again prices must rise. Thus at the moment all parties in the State argue and act in a vicious circle. Legislative interference with wages is suggested as a panacea without consideration of the very causes which render increased wages necessary. Old Age Pensions—13,000,000*l.*—have to be contributed to by persons who are not old, and in the same way unemployment insurance will have to be paid for by persons who are engaged in trades to which this part of the Act is not applicable. Place the whole contribution of 7d. or 1s. on the employer, yet the consumer of the commodities he produces will in the end bear it.

We are eating our cake and grumbling because we cannot keep it. We do not deny the necessity for cake, but we do desire to point out that it has to be paid for, and that no legislation can be devised which will in the end relieve the nation as a whole from paying for the luxuries which it is the custom nowadays to demand and to grant.

THE ARCHITECTURAL SOCIETIES OF FRANCE:

II.—LA SOCIÉTÉ DES ARCHITECTES DIPLÔMÉ PAR LE GOUVERNEMENT.

LA SOCIÉTÉ DES ARCHITECTES Diplômés par le Gouvernement is a comparatively young society, but it is one of growing power in France. The title is an asset in itself, and carries weight with public authorities, as well as with private persons, as all such labels do. We need scarcely say that the diploma is not obligatory, and that it in no way corresponds to the title that would operate under an Act of Registration such as it is sought to establish in England. The diploma is a scholarly degree granted to the students who have undergone successfully a certain course of study—that is to say, the training of the École Nationale des Beaux-Arts. And it is also granted to those who have won the Grand Prix de Rome in Architecture. It guarantees, therefore, a thorough architectural training. The course of study in architecture at the Beaux-Arts is generally accepted as a model of the highest standard. Architectural education in America has almost wholly fallen under its influence. In England there have been tentative attempts to establish its programme, which have not been without useful effect. In Germany and Austria, on the other hand, the Beaux-Arts system has fallen a little into disrepute; even the older men, who were trained more or less under its influence, have practically united forces with the more modern secessionist in the rejection of its teaching. In France itself there are indications that other educational influences are also beginning to count. The qualifying degree of the Société des Architectes Diplômés is sought for the distinction which education at a University (for it amounts to that) with a tradition confers; it is also sought for other reasons. The trammels of bureaucratic centralisation which the first Napoleon established in France, with its manifold ramifications, created (it is one of the most curious facts in history) out of the descendants of the *fauves* of the Revolution a subservient and docile class who are known in France as *fonctionnaires*. The diploma is useful to the man of that class. It makes him a more likely candidate for many useful positions under the State or the various municipalities. A Beaux-Arts man is, notwithstanding, always a Beaux-Arts man; the spirit of the ideal *fonctionnaire* can scarcely evolve out of so liberal an artistic system.

The history of the struggle by French architects for a diploma is both instructive and interesting, and goes back much further than the foundation of the society of which we are speaking. The agitation first began to make itself manifest in 1840, when it was sought to establish an obligatory diploma. The conditions of architectural practice ha begun to change after the Revolutio Previous to that cataclysm the architec under conditions that were much le complex than those which develope subsequently, was his own builder contractor (*entrepreneur*). With th growth of science, the enactment complicated building laws, and so o his duties became so various that was necessary to devolve some pa of them on other shoulders. Howeve this may be, the builder or contract came into being as an independe person—a new fact in the Frenc building world. The consequence his advent was that the client, instea of being able to place himself uni servedly in the hands of an architect, was the case formerly, had also to pla himself more or less in the hands of th builder. M. Bonnier, in an address whic he delivered before the Internationa Congress of Architects in 1897, suggeste that the interests of the builder and th client are necessarily inimical. We do n quite believe that. For, as a general pr position, it is not to the interest of eithe architect or contractor to perform wor which does not give satisfaction. is not a general question of honesty competence that is involved in eithe case. In France it was a question the division of parts, which had hithert been integral, of architectural practic But—and this the French architect of the forties found to be the danger the new state of things opened th way to men who were wholly competen neither as architects nor business me It opened particularly the way to a typ of man who was successful in persuad ing the public that the so-called artisti architect was so engrossed by immateria and abstract views of his art that th details of construction and the interest of his client had become to him matte of small importance. That was th danger which the French architects the forties sought to mitigate by a obligatory diploma, by a sort of Act Registration. And it is curious to not that the agitation for the diploma wa begun by members of the Société Central des Architectes, that it was carried o for many years, and that in the end notwithstanding the meetings and di cussions of an almost interminable seri of "Commissions" appointed for th purpose, a solution of precisely wha qualifications an obligatory diplom should exact has not yet been solve by the most important corporate bod of architects in France.

Many members of the Société de Architectes Diplômés are also members the Société Centrale; the two societie are in no appreciable way antagonistic while in certain matters of genera interest to architects, such as the regu lations of the conditions for competi tions and so on, they exercise commo action. The older society, however does not altogether recognise the Govern ment diploma as a sufficient test o architectural competence. It says, o at any rate some of its members say, i effect, "How are you to gauge th abilities of a man in an art and professio so complex as architecture merely fro his achievement in school studies?

t is to say, while admitting the dis-
antages of the open door, which exists
architectural practice, the Société
trale considers that the closed door
ld still leave a choice between two
ciples, neither of which would work
sfactorily in the higher interests of
itecture. So the door remains open
France—but not, however, to the
bership of either of the societies of
ch we have been speaking. Here
doors are strictly guarded. In
case of the older society admission
only granted to men of proved
itectural competence, whatever may
e been their system of training; and
he case of the younger society it is
granted to those who have won
r spurs in practical scholarship.

e Musset once wrote a charming
edy bearing the title of the French
verb :—"*Il faut que la porte soit*
rte ou fermée." But in France, as
he United Kingdom, the door for
e who wish to practise architecture
neither open nor closed. In each
ntry, however, a *via media* has been
d. In France it is the Société
rale, in Great Britain the Royal
itute of British Architects. The
s of both institutions are only opened
r an examination of the credentials
those who desire to enter. The
al Institute has discovered a
e logical method of establishing the
dard of the credentials than its
ch sister, a standard which solves,
s system of examination and in its
nction of grades, difficulties which
ier of the French societies has solved
e satisfactorily. In formulating a
me of Registration the British society
ckling a question which many years
rganised thoughtful effort in France
e middle of the last century has still
unanswered. The diploma of the
ernment does not provide a sufficient
ver. It is too limited and too
usive. It is in principle wholly
gonistic to any all-embracing Act
Registration. For the purposes of
parison we may ask what would
general body of practising architects
is country say to the British Govern-
t granting its imprimatur and, to
extent, special privileges to the
ents who had passed successfully
ugh the schools of the Architectural
ciation? But the Architectural
ciation does not occupy the same
ion in national estimation as l'École
onale et Spéciale des Beaux-Arts,
it would be absurd not to recognise
the diploma in France is becoming a
er asset to the man in architectural
tice, and that the corporate body
pidly extending its influence.

W PROFESSOR OF FINE ART, CAMBRIDGE.

E. S. Prior, F.S.A., F.R.I.B.A., has been
ed Slade Professor of Fine Art in succession
. Waldstein, resigned. The new Professor
orn in 1852, and was educated at Harrow
Caius. He was a pupil of Mr. Norman
, R.A., and has been architect to Cam-
e University, where he designed the
ing in which the present Medical School is
d, to Harrow School, and to Winchester
ge, and has built churches and houses in
parts of England. Mr. Prior was one of
ounders of the Art-Workers' Guild, and has
Secretary of the Arts and Crafts (London)
ibition Society since 1902. His publica-
include "A History of Gothic Art in
nd."

NOTES.

Site for London University.

THE proposal to acquire the vacant land on either side of the new avenue leading from the British Museum extensions to Torrington-square as a site for London University buildings seems, from many points of view, to be excellent. It is central and easy of access, and its contiguity to the British Museum is a point in its favour. The space available is said to have an area of some 2½ acres, and, although this does not permit of any very spacious architectural lay-out, something can perhaps be made of it if it is suitable in form. The mention of four distinct plots suggests that there may be some difficulty in this respect, but, no doubt, the University will take the best architectural advice obtainable before finally selecting it. We gather that this site is suggested not so much because it is considered to be the one ideal position, but because it happens to be vacant and, in some respects, suitable. The difficulty of finding other available land in the centre of London must necessarily influence the decision of the University; but, all the same, it will be a pity if they are content with anything but the best. The erection of a public monumental building as the centre of the culture and educational life of London is an artistic undertaking of the first importance, and the first necessity is a fine and unrestricted site in the right position. This illustrates once more the pressing need for a general scheme for London to which such a monument as this would be properly related.

Further Improvements for the Marble Arch.

ALTHOUGH most architects will probably agree that it is time that piecemeal tinkering with our streets and open spaces should come to an end, they would no doubt be sorry if any such expression of opinion damped the enthusiasm of those with more zeal than technical knowledge. After all, nothing can be done unless private citizens take an interest in their city. Their desire for improvement supplies the motive power, the driving force which, guided by expert knowledge, should achieve success. The tragedy comes in when it is misdirected, when an idea which in competent hands might have produced good results is mishandled by an incompetent authority. The deplorable result of the Marble Arch improvement may well have so disheartened all those best qualified to judge that they despair of any further attempt to deal with it in detail until it can be handled broadly as part of some general comprehensive scheme.

Victoria and Albert Museum.

THE Victoria and Albert Museum has recently acquired a considerable number of drawings and designs by Alfred Stevens from the collections made by two of his pupils, James Gamble and Reuben Townroe, both of whom died in the early part of 1911. These have now been mounted and labelled; and a selection has been placed on exhibition in Room 75, advantage being taken of the opportunity to rearrange the drawings by Stevens already shown there, which are now grouped according to subject throughout the gallery. Designs for the decoration of St. Paul's Cathedral form one of the most important sections of the exhibition, the various studies in red or black, chalk or pencil, being illustrated by tracings made by Townroe and Stannus of the completed designs. The designs and studies for the decoration of Deysbrook have also been brought together, and are now supplemented with several full-sized working drawings of details in colour, which have not before been exhibited. One of the most interesting of the new acquisitions in this class of work is a sketch in water-colour for the decoration of a staircase and landing of a public building. The collection also includes studies in black chalk for the decorations of Dorchester House, and designs for silversmith's work, candlesticks, street-lamps, pottery and stoves, as well as a large number of slight sketches of architecture and furniture and memoranda of subjects for figure compositions. The Museum now possesses upwards of 500 drawings and studies by Stevens; those not exhibited in Room 75 (or Room 48, where a series related to the Wellington Monument has been hung) being obtainable on application in the Students' Room (71) of the Department of Engraving, Illustration, and Design.

The Society of Twelve.

THE Society of Twelve has increased its numbers by one-half, and yet certainly not more than the Apostolic number exhibits at its seventh annual exhibition at Messrs. Colnaghi and Obach's galleries in Bond-street. The note of distinction of the Society of Twelve is a thing apart. It is, for instance, extremely modern; its work is of the intellectual and theoristic kind, yet the show contains no suggestion of Post-Impressionism; it contains, in fact, no work which has not a sort of traditional justification. The Society is, in a word, academic without being formalistic. The late M. Legros was the Society's only honorary member. And the work of that distinguished artist, which was always so true to the simplicity of his fine temperament, which never, we think, discovered a standard below its highest attainment, expresses in a measure the aim which gives unity of effect to the 117 etchings, pen and pencil drawings, etc., which comprise the exhibition. In the choice of subject architecture is not left out of account. The drawings of Mr. M. Bone are familiar to all architects, though they have been mainly concerned hitherto with scaffoldings and shoring and building in the making. Mr. Francis Dodd and Mr. Ian Strang are definitely interested in architectural forms. Mr. Gordon Craig, so far as his view of architecture is concerned, is either purely inventive or prehistoric. We rarely visit the theatre in England, where so much accuracy in matters of scenic detail is attempted, without feeling the possibilities for composition which would be a joy to the young architect of promise. Could he not give us all that Mr. Gordon Craig gives us and more?

Bridges.

Everyone attending the last meeting of the Architectural Association acquainted with the literary work of Mr. Paul Waterhouse probably expected to hear an admirable lecture from him on "Bridges" on the occasion of the combined meeting of the Association and the Junior Institution of Engineers, but few of his hearers could have been prepared for such a lecture as he delivered—such a happy combination of wit and sound sense, presented in a novel form and with so much literary grace and effectiveness. And the occasion was made additionally interesting from the fact that the lecturer showed various drawings and sketches by his father, the late Mr. Alfred Waterhouse, R.A.—sketches which show the work of an artist of much skill and poetical feeling. In many ways the subject of bridges is a fascinating one. The accomplished result of a bridge, the triumph of man over nature, is always something of a miracle; and when such structures are suitably designed, and in harmony with their surroundings, it is small wonder that they are a source of admiration to all who care for objects that are beautiful as well as useful.

COLLEGIATE ARCHITECTURE.

An ordinary general meeting of the Royal Institute of British Architects was held on Monday, at No. 9, Conduit-street, W. Mr. Leonard Stokes, President, in the chair.

Deceased Members.

Mr. H. T. Hare, Hon. Secretary, announced the decease of Mr. Alexander Graham, F.S.A., formerly Hon. Secretary of the Institute. Mr. Graham was elected a Fellow in 1879, and he had taken an active part in the affairs of the Institute, having served on the Council, acted as Hon. Secretary for ten years, and Vice-President four years. He was for several years a member of the Board of Examiners, and also of the Literature Standing Committee, of which he was some time Chairman. He was a frequent contributor to the *Transactions* in the early years of his connexion with the Institute. Mr. Hare moved that the Institute should record its profound regret at the loss of their esteemed colleague and that a letter of condolence and sympathy be sent to the relatives. He also read a letter from Sir William Emerson. In the course of his letter Sir William said :—

"A steadfast supporter of the Institute, he was from the first one of the most active and zealous of its workers. During my term of office as Member of Council, as Hon. Secretary, and afterwards as President, I had frequent opportunities of observing the high-mindedness and disinterestedness he displayed in all that he did for the Institute. A man of the strictest probity and integrity, he placed the honour of the profession and the well-being of the Institute before everything: to preserve the one and secure the other he would count no personal sacrifice too great.

His courtesy and urbanity of manners were familiar to us all; no one could discharge with greater distinction the various public and social functions that fall to the lot of the Honorary Secretary of the Institute. He was true and sincere in his friendships, ever sympathetic and warm-hearted, and one of the cheeriest and most agreeable of companions. I know personally that not a few young architects have cause to be grateful to him for his kindly advice and assistance."

The motion was agreed to in silence, all the members standing in their places while the President put the motion.

Mr. Hare then mentioned the decease of Mr. T. M. Rickman, F.S.A., a member of the Institute for nearly fifty-eight years. Elected an Associate in 1854, he represented the Associates on the Council of the Institute from 1887 to 1896.

A motion recording the regrets of the members was passed, and it was agreed to send a letter of condolence to the relatives of the deceased.

Mr. Hare also mentioned the decease of Mr. Charles Smith, of Reading, another member of nearly fifty-eight years' standing: and Mr. W. King Lucas, elected an Associate in 1881.

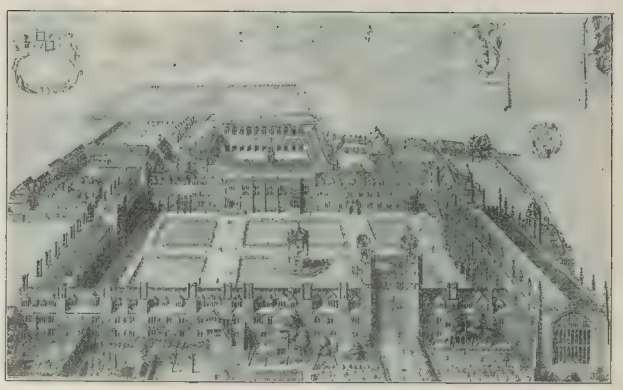
Mr. Edward Warren, F.S.A., then read a paper on "Collegiate Architecture." Having dealt at some length with early and later Collegiate buildings, the author made some personal observations in speaking of residential colleges. In the course of remarks he said :—

"If you adopt the quadrangular plan, a think that you cannot, generally speak do better on all accounts, you will be unless the ground and other circumsta permit of large courts with low surroun buildings, to remember the open front to south, or else to have open corners which be bridged by arches, to admit of air curre Such open corners can be easily and effecti managed if you adopt the cloister gr plans with arcade or colonnade, and thi itself is a practical and architectur admirable arrangement. Or you can perh find useful suggestions in the double scre or pierced ground story of Peterhouse. assuming that you adhere to the healthy invigorating system of passageways open the air.

As the plan of repeated staircases, with dependent groups of rooms on each succe floor, still finds, and is likely still to favour in colleges it may be well for a mo to consider some of its possibilities, and that end, I show you a plan of Brase College, in which you will see the arrange of the old chambers, and Mr. T. G. Jacks disposition of the new. But if you ar your ground floor you must of course na the depth on that floor available for ro and will probably find that lecture ro bursaries, single rooms for non-resident tu or single sets can best be placed there. Lock has pointed out that the arrange of two sets in depth with the dividing has two disadvantages—(1) you lose opportunity of free air passage, or perfla so easily obtainable if you have single se sitting or "keeping" room and bedroo the depth, by means of the usual commun ing doors; (2) both bed and sitting r must have the same aspect. There further disadvantage, which is that as span increases your roof is apt to grow hig and it is generally desirable to keep it d If bathrooms are supplied and with a suffi number of baths the bedrooms can be small, say, about 100 sq. ft., or slightly less; but, of course, a comfortable space not facing the light should be prov Bathrooms are very generally placed in basement, and this where the ground flo raised a little, so that window heads ca brought slightly above ground, does well, provided that the necessary areas light and ventilation can be outside quadrangle, *i.e.*, at the back of the ra and wide enough, and that smaller area fresh air inlets are provided in the quad as to give a cross current. The baths generally arranged in cubicles some 7 f 5 ft., with partitions 6 ft. high or thereab and raised well off the floors, in the ra a bath to four or five men, and about ha number of shower baths. A service-room keeping and drying towels, and a ge dressing room or two, for muddy fresh from "Rugger or "Soccer,"

Presbyterian College, Cambridge. Mr. H. T. Hare, F.R.I.B.A., Architect.

sable, with a supply of lockers for flannels,
If you have a bathroom and consequent
boiler somewhere in the basement a hot
r supply to each pantry can be arranged.
Fellows' rooms are usually now in sets
hree, a large sitting or tutorial room, a
ler sitting-room and a bedroom, and
ld have an "oak." College bursaries
merely offices for college business, and
ld be conveniently placed near the
ance. There must be at least two good
lit rooms, the bursars' and bursary clerks',
a strong-room and lavatory. Frequently
e rooms are needed, a senior and a junior
ars' rooms, and a college office or meeting-
.



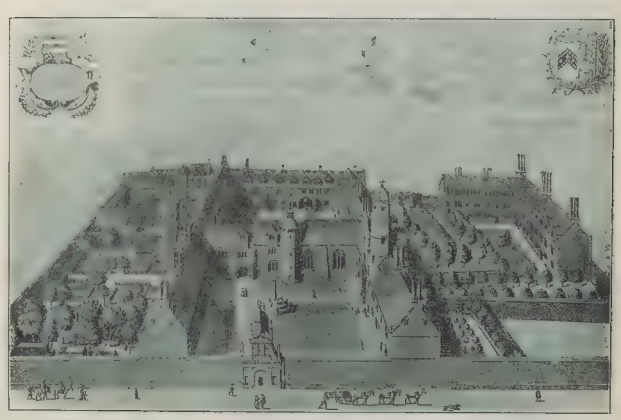
he master's dwelling has grown from the
rooms formerly allotted to celibate
ers, and are now complete domestic
llings for married men, much like a good
ry house in requirements, but with one
ial need, a really large study or library.
an ante-room leading to it. The dining
should also be a large room.

he common-room has expanded from the
nt parlour or solar into a group of rooms
ituting the Fellows' private club, and
ng a large and comfortable sitting-room,
e desert, wine, and coffee are taken after
er in hall, and where luncheons are
rally served. Attached to, or near, this
he now invariable smoking-room, and it
t infrequent to have a third and smaller
for writing, etc. The junior common-
is the undergraduates' club, and usually
sts of one large room, where breakfast,
frequently luncheon also, is served. It is
l to provide a second room for reading,
ing, etc., and for both senior and junior
non room groups a distinct lavatory is
sable. There is a new refinement of the
non-room group which I have just been
d upon to supply at Oxford—that is a
non-room dining-room, with an ante or
ing room leading to it, and a cloakroom
lavatory.

esidential colleges for women are multi
g and extending and growing in archi-
ural importance and beauty. These
rally require somewhat different arrange-
ts, the general system being more
estic, and open-air passages and basement
rooms, etc., being usually avoided.
ge bed-sitting-rooms usually take the
e of the masculine double set, but parlours
music and recreation-rooms are provided.
erwise the recognised collegiate require-
ts apply, the chapel, hall, and library
g just as essential, or even more so, than
the other sex. Bursaries, perhaps, are
so formal, and common-rooms have a
er different character, being, for one
g, connected more with tea than the
e.

Chapels.

he chapel of a college is traditionally a
ncel, screened off from the ante-chapel to
ch the non-collegiate are admitted, and is
survival of the monastic choir screened
the secular nave. In obedience to this
ition the seats are arranged as stalls,
ing inwards instead of eastward as in
lar churches. Return stalls are allotted
he master or president and his more
ediate satellites. The seats are arranged
iers rising from the gangway, the Fellows
pying the upper and more dignified rows,
undergraduates the inner and lower. Thus
ake a bench seat in a college chapel is to
ease and not to diminish one's dignity.
s arrangement seems so suitable as to
no adornment in modern times. There
usually no pulpit, as sermons are only
sional and commendably short, and
vered from the lectern. As is common in
collegiate churches in England, cathedral
ther, the organ and choir gallery are very
lly placed on top of the screen, an
irable arrangement both musically and
tically. A college chapel is of greater
ht than adjacent ranges of the building,
placed axially more or less east and west,
ld, if on the side of a quadrangle, be
ys on the north side, so as not to cast its
lows where shadow is detrimental. The
observation applies to the hall if lofty
if similarly placed. The chapel is the
er without any east window as a rule,
chapel and hall alike are the better for
terrupted ranges of side windows, which
best kept high, in the first case on account
he stalls and their panelled backs, in the



Trinity College, Cambridge.
(From Loggan's "Cantabrigia Illustrata.")

second to avoid a low light in the diners' faces, and to provide the opportunity of a high wainscoting, which is incidentally an admirable background for college portraits. The screen, of course, is a mediæval survival immemorial in refectories and dining-halls. It has survived because of its obvious utility. It shuts off from the hall the draughts of constantly opened doors, the scurry of servants, and all the traffic between buttery or pantry and kitchen. It is as useful now in all these respects as heretofore, and it has an added function in screening the modern appurtenances of service lifts, hot tables, switchboards, and call tubes, and all the constantly growing paraphernalia which science provides for the furtherance of material ends. Its ancient form still subserves modern usages, or, perhaps, more correctly speaking, has begotten them, in the happy fact that its roof provides a gallery, anciently intended for musicians, and still sometimes devoted to music. It is very useful, during the crowded festivities of college balls, as a retired post of vantage for observant chaperons, or a resting-place for the breathless energetic. It has many utilities, and should on no account be omitted. The college dining-hall is the great social centre and the common meeting-place of the college. It has to serve for examinations and special assemblages of various sorts. It needs careful lighting at night, as by day, and careful warming and ventilating. Low or high-pressure hot-water systems, fresh air inlets, and the electric fan provide admirably for these requirements. It is generally wise to give it a good dancing-floor of oak boards. The hall may be, as old halls frequently were, placed over the kitchen, buttery, etc., but should be so disconnected that kitchen smells do not penetrate it.

Libraries.

The recognised collegiate plan for libraries is not only picturesque—*i.e.*, architecturally effective—but practical; the double bookcases standing at right angles to the walls give increased book space, and at the same time divide the room into secluded bays where students can sit at a table and work in comparative isolation. The bays should be not much less than 9 ft. between the bookcases, and will be better from 10 ft. to 12 ft. wide where tables are to be inserted; and this arrangement implies a window to each bay. The lighting of libraries is important; north and east are the best main lights, but if a long library is lit from its north and south or east and west sides blinds or curtains will be needed on the south or west sides. Quietude of effect internally is essential, and a scholastic gravity of exterior seems appropriate, but there is no need externally or internally for the gloom and ponderosity so often bestowed upon libraries. In planning a non-residential college, say the modern university college of a large town, and intended, of course, for both sexes, the problem becomes very different. The chapel is usually not required, the hall subserves different purposes, and is usually more or less of a speech hall; lecture-rooms, lecture theatres, and classrooms, scientific laboratories and workshops are needed, and, not infrequently, some sort of museum is added, and a gymnasium is not unheard of. Colleges, residential and non-residential, have been devised and built in recent years in considerable numbers, and it is interesting to

Gonville and Caius College, Cambridge.
(From Loggan's "Cantabrigia Illustrata.")

observe in what manner the collegiate sense has been accepted or interpreted by those to whom it has fallen in recent years, either at Oxford or Cambridge, in immediate contact with these ancient things, or elsewhere free from such propinquity, to build colleges or schools of collegiate type."

Mr. Basil Champneys,
in moving a vote of thanks to the lecturer, said a question which had been constantly before his mind was, how the standing arrangement of staircases in college buildings came about. To him it was a great puzzle. The only theory which he thought met the case was this. Mr. Warren showed the old buildings of Worcester College, Oxford, where there are a number of small buildings, each with a difference of assignment and each with a different staircase and its rooms. And these form a kind of conglomerate. Worcester was too late a precedent for New College, or even for Merton, but it was known that in the earlier Oxford there were a multiplicity of halls. Was it possible there might have been in Oxford some sort of conglomerate halls like that of Worcester, of earlier date, which might have suggested the plan of separate staircases, such as was adopted, as far as one could tell, by William of Merton, and certainly by William of Wykeham, at a later date? However it originated, there was no doubt the staircase arrangement, as used by William of Wykeham, had held its own, and, though the purposes of the rooms have been converted, it seemed to him the best arrangement on which colleges could be planned for the present day.

Professor Simpson
seconded the vote of thanks, and in doing so said he regretted that the lecturer had not referred to the big modern laboratory buildings for scientific research which must now form a part of every University. Those buildings required an entirely different treatment from the old buildings. In modern buildings large windows, lofty rooms, and the walling reduced to a minimum were absolute necessities.

The Rev. T. B. Lock (Bursar of Gonville and Caius College, Cambridge)
said as to Mr. Champneys' question, how the colleges took their present shape, last summer he studied Haddon Hall, which was almost an exact replica of an Oxford or Cambridge college; there was the hall, the kitchen, the chapel, the combination room, and in addition the long gallery. That was common to all colleges. Queens' College, Cambridge, was almost a replica of Haddon Hall. The arrangement was not quite the same, but there were two courts, and you pass from one court to the other through screens—that is to say, the gallery and the hall. The gallery itself is in exactly the same position in Haddon Hall as the gallery in Queens'. The chapel is in the same position, and the only difference is that the kitchen is on the south side of the court, and is approached not through the screen, but they had to cross the court to get to the hall. With that before us we cannot have any doubt as to the origin of the collegiate form which we see so frequently repeated. The dwellings were separate houses ranged around the quadrangle, we might call them staircases, just as they are at Oxford and Cambridge. As an instance of the advantage of having one side of a quadrangle open, it occurred to him that he might mention in the presence of Mr. Jackson his ingenious solution of that difficulty. When the court in which the Geological Museum, Law Library, and new Archæological Museum which Mr. Jackson was now building were being arranged, it was wished to keep an opening on one side of this long court. Mr. Jackson suggested they should put the library on top of open arches. That seemed at once to solve the question; there was fresh air coming in through the middle of the space, and on the top of it was a beautiful library, devoted to Law, which Mr. Jackson had built.

Mr. T. G. Jackson
referred to the growth of the college plan such as was found at Oxford and Cambridge, and said that they grew up insensibly without any definite motive at first. These college buildings grew up in a sort of accidental way, and the Universities existed for a long time without colleges at all—young men being lodged in halls. There were private houses of the ordinary domestic type, and with two or three of them thrown together we got the origin of the Oxford staircase, and when colleges came to be founded they were made up of half a dozen halls thrown together.

Mr. Aymer Valance showed some additional slides, and also remarked that colleges were built up of pre-existing halls, and that explained how the central staircase came in; it represented a separate cell. The buildings were built up and added to just as they were required.

The Chairman then put the vote of thanks to the meeting, and it was heartily agreed to.

Mr. Warren, in reply said that New College appeared to have been a deliberately planned college, and was not built up by bits, as was the case in other colleges.

The Chairman announced that the next meeting will be held on March 4—a business meeting: Election of the Royal Gold Medallist.

The meeting then terminated.

BRIDGES.

THE following is the second part of the paper which Mr. Paul Waterhouse, M.A., read last week before the combined meeting of the Architectural Association and the Junior Institution of Engineers, together with some notes of the discussion which followed. The sketches which Mr. Waterhouse showed, some of which were reproduced as slides, were the work of the late Alfred Waterhouse, R.A. Other slides were from the photographic collection of the Architectural Association:—

"If the Devil built the Roman bridges, who built Napoleon's? What do you think of this one from the French side of the Pyrenees? Whether it is a true product of Napoleon I do not know, but it is an absolute poem on all that the word 'Napoleon' means. That leap so rash and yet so assured, that exact fitting of available means to an end, and, to crown it all, that trim bit of Roman assumption in the parapet. Add to this the position in Nature, the rugged, lonely, and defiant spot upon which the hand of resistless man has been laid with infinite delicacy, yet infinite pertinacity, and you have here a sonnet or an essay clearer than any in mere words."

"Surely," said Harper, interrupting, "you are beginning to fly rather high in your rhapsodies! The simple fact probably is that the bridge in question presents, in the absence of steel or chain construction, the most obvious and practical device for the purpose. It is really difficult to understand what simpler expedient Napoleon (or the Devil, for that matter) could have adopted."

I ventured to cut in with the suggestion that, after all, the span—as I happened to know—was 150 ft., and that, whether we looked upon the structure as poetry or prose, devilish or Divine, it certainly needed a bold mind to entertain the idea of flinging a bridge across such a chasm at all. Humbler men in a less enterprising civilisation would have been content to master the difficulty by taking a circuitous route.

Bridges and Sentiment.

Said Pargiter: "If you are a man [illegible] sensibility at all—in the good Jane Auste[n] significance of that word—you can't lo[ok] upon bridges in any but a sentimental ligh[t] Bridges are full of sentiment, steeped in [it] and unless you are accustomed to go throug[h] the whole of life seeing nothing but facts a[nd] figures, you are compelled to receive som[e] thing of the message which almost eve[ry] bridge bears."

"Charing Cross Bridge, for example," sa[id] Harper, "and that which exudes fro[m] Cannon-street Station like a slug from [a] loathsome lair!"

"There," said Pargiter, "you rath[er] have me. Let us wipe out the thought [of] poor old Thames by the refreshment of [a] glance at Florence—Florence from S[an] Miniato, one of the fairest prospects in t[he] whole world, and a prospect of which t[he] bridges are the fairest part. Look at the[m] as they glide one after another, marking [in] their perfect radiation the noble curve of t[he] noble river, each true to its trust, economi[s]ing its material, and springing from pier [to] pier with as little waste of stone as w[ill] suffice to bear in safety from shore to sho[re] the gaiety, the commerce, the beauty, a[nd] the strength of the city that was worth[y] to be Dante's and Alberti's home. Pon[te] Vecchio, the old bridge, and the farthes[t] breaks, you think, the rule of economy. B[ut] no; it only shows its mastery by one [of] those delightful thefts from the river [by] which we should have an example in Lond[on] if only old London Bridge were still spar[ed] to us. The Ponte Vecchio is like a travell[er] who, wayfaring through difficult countr[y] traffics as he goes. Its parapets are lin[ed] with shops, and many are the English poun[ds] that have been lured over its entici[ng] counters.

Durham, Conway, and Monmouth.

It is hardly fair (he went on) to co[m]pare London with Florence, for if there [is] one thing more than another that bridg[es] express it is nationality; so let us set up [in] a minute this sketch of Durham. See t[he] rugged British force of the whole co[m]position. The bridge belongs to the Cath[e]dral. Its slope emphasises the height of t[he] crag on which the Cathedral stands, and [its] irregularity—lack of uniformity between o[ne] arch and another—adds immensely to [its] rough vigour of the scene. A suspe[n]sion bridge can be, and often is, a lov[ely] thing, but imagine, if you can, a suspensi[on] bridge taking the place of Durham's ro[ck] causeway, and you will realise that it wo[uld] spoil the picture absolutely."

I instanced the suspension bridge at Co[n]way as an example of the discord to whi[ch] Pargiter referred, but he was not who[lly] willing to agree, declaring, with delight[-]ful inconsistency, that the lightness a[nd] modern grace of the steel-rope structure ga[ve] force and mass to the Castle, and was con[se]quently of pictorial value.

"Your mention of Wales," he adde[d] "reminds me of Monmouth and its truly [ex]cellent bridge. The first time that I saw [it] —quite unprepared—it gave me a shock. [I] could not believe that I was in Brita[in]. The bare idea of a bridge having anythi[ng] on it in the way of a bridge house, [or] chapel, or other structure, is so entir[ely] foreign to our island's methods. Engla[nd] is fearfully parsimonious in the matter [of] little excesses of this kind, so that on[e] first involuntary cry on seeing such [a] development is, 'How did they afford it' Compare this with a Nuremberg example, a[nd] you will hardly guess which is the Engli[sh] and which the German.

There is great charm about a bridg[e] with something on it—of course, as an alt[er]native to the bridge which is a bridge alo[ne]. That is one reason for our bitter regret [at] the loss of old London Bridge. That [at] Florence's Ponte Vecchio, and in a differ[ent] degree Venice's Rialto Bridge, are instances [of] the instinct to make good financial use [of] the space which the bridge has won from [the] water, a picturesque act of commercialis[m] which might well be repeated in mod[ern] times.

Why we habitually shrink from [the] chance of making a bridge pay rent for [its] existence by a row of shops is more than [I] for one, can understand.

Buildings on Bridges.

Of bridges with things on them there are veral kinds. There is the covered bridge, which there are two at Lucerne; there is e bridge with a chapel, of which even ngland has one or two examples; there the noble bridge at Pavia with both oof and chapel. Then there is the festive oman idea of a bridge with one or two iumphal arches. We saw the rudiment of is in the Puente del Diablo; a better xample is the bridge at St. Chamas, of hich I have found an old engraving. Even on, Harper, must allow that such a bridge sentimental, for a triumphal arch has no eaning whatever but a sentimental meaning. is a costly expression of pride."

"I am not quite so sure of that," said arper, "for you will probably find that a ood many so-called triumphal arches are in ality merely glorified versions of toll-bars customs-barriers, and those placed upon bridge may very probably have served both rposes. But I see you have there a photo-raph of the Palladian Bridge at Prior Park, ath, which, like that at Wilton, I frankly mit to be a mere piece of building for fect. In fact, it is a garden ornament, to e classed with statues, urns, and fountains mong those products of masonic and sculp-ral art which by their presentation of nament without use are thereby removed om architecture according to my definitions that art."

"You are on very dangerous ground," id Pargiter (for if you talk of ornament thout use you imply that there is no use r ornament), "but if we enter that ground ow I fear we shall never get through our rtfolio and its enjoyment."

"Very good," said Harper. "Let us ave the dangerous ground, but before you roceed to say anything on the subject of rge towns with large bridges on large vers I want to put in a word of common-nse caution. You are off on the tack, rgiter, of seeing something more than eets the eye in every bridge that ever was uilt, and before we get too far in our ghts I have just a word to say.

We all know the story of the innocent rson who observed that all the larger vers of the world seemed to make a point running through or by the largest towns. he fact, of course, is that ancient cities eded a river (if they could possibly secure site upon one) for transport, for water pply, and for defence. Here were three eat natural advantages to be had for thing, and only one disadvantage, the need cross the river, which need was met by e inevitable bridge.

Thus it comes about that to most ediæval cities—for most of them managed fulfil their desire in finding a river and ttling by or on it—to most mediæval cities substantial bridge was a common utili-rian adjunct as general and as unworthy special artistic enthusiasm as the railway-ation, which is the common accompaniment the modern city. I have here a photo-aph in point. It is the fairly well-known onte del Ammiraglio outside Palermo. I mit it is a well-built, bold, and a very cient structure, but it would be a mistake look upon it as one of the wonders of the chitectural world, or as conveying one of ose poetic messages which you, my friend, e seeking to find in every combination of ers and arches."

Pargiter looked steadily at the photograph d said :—"You have an eye like a Kodak, arper, and I am prepared to admit that the mera which took that view missed a good al of what there was to be seen. I am not lling to say that even that bald present-nt fails to convey to me something of the rit which is really in the bridge, but I certainly claim that the sketch—for, dly enough, there is in the portfolio a etch of the same subject—sees more and ys more.

Toledo and Limburg.

But while we are on this side of the bject just think of Toledo. Toledo on the ap occupies a peninsula three-parts sur-unded by the Tagus. A bridge or two is erything to Toledo—necessities if you will, t none the less gloriously important. To bridge to Toledo is a proud office. Why, King is a necessity (to some of us), and a coachman is a necessity to the Lord Mayor, but you don't think that King or coachman are the less proud for their needfulness. The bridges of Toledo know fairly well the glory of their office, and don't they just show it? Look at this one. There is no common-place drudgery about this fellow; he certainly has his duty to perform, an everyday duty of conveyance, but he goes about it with the gaiety proper to the drummer of a cavalry regiment, and if you were to walk over him you would feel pride arching his back in every yard of his up-and-down gradient. And should you wish to know how Toledo's other bridge bears its burden of office, go and see it by moonlight as painted by Harold Speed in the Tate Gallery.

Your position, Harper, that necessitous duty knocks the sentiment out of these friends of man, is no good. Look at Limburg. Limburg doesn't say that, having settled on the River Lahn for commercial and strategic reasons, it has built a bridge as a traffic necessity. Not a bit. It says, in defiance of history and geography, Here am I, Limburg. I have chosen a fair hill-slope for my township, I have ordered a majestic crag for my cathedral, and, to make my picture perfect and to show that I am lord of my great river, as well as of my noble landscape, I have flung across a bridge—such a bridge. And what does the bridge do for the cathedral? Everything. It makes length to emphasise the cathedral's height, it makes mass to emphasise its detail, fore-ground to give distance, colour to catch sun-shine. Where is your railway-station now?

What Bridges Tell.

No; you can make nothing of your assumption that a bridge is a mere fact. Take even these two quiet English works from the River Thames. What do they tell? A whole story. British character, for one thing; for another, that, though standing in a country landscape, they are near a large and cultivated town. They tell you that the road they carry is an important one; they tell you that they belong to an age in which bridges still ranked as architecture, and their classic detail tells, what classic detail always tells, that the men who built them belong to a brotherhood wider than Europe and as old as Greece.

If you are to criticise them, it will be to say that they are not at one with their surroundings, but they are not wholly meant to be; they are the advance-guard of London coming forward to meet the traveller with a foretaste of the town and its culture.

But if you come to speak of fitness among surroundings, see how these three arches over the moat at Kentwell Hall take their place among the trees—so tenderly, so perfectly, that they almost add to the very silence of the scene!"

I asked Pargiter if there were any sketch of the bridge at Avignon. "Alas, no!" he said. "I wish there were. Such a bridge as it must have been! The lean fragment

Dolce Acqua. From a Sketch by the late Alfred Waterhouse, R.A.

(Illustrating Mr. Paul Waterhouse's Architectural Association Paper on "Bridges.")

that remains is like a greyhound—a bit of tense, almost muscular, masonry. Its very destruction seems to show how fine in its case was the margin between weight and energy.

And what have we here—the last in the portfolio? The bridge of Prague. What a change! Here is nationality with a vengeance. No English town, no French, could have expressed itself in such a guise. Look at its gallery of statues; look at its towers, at their challenging inequality, their fantastic shape! The crucifix that crowns the bridge's centre was paid for, so they say, from the fine laid upon a Jew who had reviled the Cross. There indeed was a rich riot of faith, and faith is a great thing among bridges."

This is, perhaps, hardly the place in which to tell you verbatim the things that Pargiter was led on to say as the result of this train of thought. You can perhaps guess his direction. He suggested that the kind of man who, for one reason or another, takes no heed of sacred emblems might yet find it in him to raise his hat when he came upon such a symbol in such a place as the crown of a noble bridge. A host of ideas ran through our friend's mind and found utterance. Art and skill, he said, had conquered Nature and force; but was that all? What of the old river god and the Divinity that now stood over him? Was there nothing in that thought? And even, apart from this, he said, if you don't care for Christian imagery and take no account of pagan mythology you still must have some faith in the doctrine of outward and visible signs. Those "books in the running brook, sermons in stones, and good in everything" that Shakespeare tells of are very real, and to all but the blindest very intelligible, very readable.

"Depend upon it," said Pargiter, "every bridge has had a bridge-maker, a pontifex, and every pontifex is a priest, and every priest has his message.

Nationality, character, mood, temperament, welcome, defiance, joy, gloom—all these are songs that a bridge can sing. But through them all and with them all it sings by its mere being, by its mere act, the song of the passing, the song of the river crossed, the song of the coming over, which is an overcoming. And for those that overcome there is a crown."

We two came out from Pargiter's room and said good-bye. I walked home with Harper. We didn't talk for a space. Then I said, "You rather curbed our friend once or twice, but I daresay you did well or meant well in bringing him down to earth. Anyhow, I know he never thinks the worse of you for it."

I said this because I thought he might be feeling remorseful.

His reply rather astonished me. "I don't care," he said, "what Pargiter thinks, but I am sure that in all he said to-day he was perfectly right."

Mr. W. T. Dunn (Chairman of the Junior Institution of Engineers),

in proposing a vote of thanks, spoke of the novel and admirable paper which Mr. Waterhouse had read. As engineers they had expected to hear something as to the design of bridges and as to materials. The lecturer had shown Mr. Waterhouse not only as a capable architect, but also as an artist and a word-painter.

Mr. H. H. Statham

seconded the vote of thanks, and said that the lecture had been essentially one on the poetry and picturesque of bridges, and they would be prepared to hear from their engineering visitors that there was another side to it. As an example of an engineering bridge which was perfectly simple but effective, there was the tubular bridge over the Menai Straits a practical construction in which there was nothing which offended the taste. What architects felt about engineering structures was that they would like them better if there was no architecture upon them. He was a great admirer of the Forth Bridge, but if any attempt had been made to ornament that structure it would have been gimcrack. It was expressive because of its enormous size and grandeur of structure.

Mr. Percy Waldram,

in supporting the vote of thanks, said a bridge was a thing with muscles and life, and no bridge-designer could think of the creation of bridges with their huge arms and muscles spanning great spaces without a very keen sense of responsibility. As to the question between architects and engineers, it really came to this—*i.e.*, whether engineers knew enough about architecture or whether architects knew enough about engineering. There was a great deal in the point of view that as structural work truly expresses itself so it grew in beauty, and the putting together of materials in the erection of such works as bridges was not a mechanical operation only. Engineers often built ugly structures, but that was not because they were engineers, but because of their bad engineering—not because they knew too much of stresses, strains, and thrusts, but because they knew too little. As to reinforced concrete for large bridge spans, he thought it was open to serious objection, concrete being such a weak material, weaker even than wood. If the arch of a bridge followed the line of thrusts there ought to be little need for reinforcement, and if there were he thought it was generally due to bad designing. Engineering and architecture were not alien one to the other, they were the necessary complement of each other.

Mr. J. J. Burnet

said he thought such mixed events were provocative of good engineering and the best architecture. He thought that no artistic thought given to a bridge should take away the engineer's work. The first duty of a bridge was to span a river or something and do its practical work, and an architect could come in to make the design suitable to its surroundings—to give an artistic rendering to the highest mechanical realisation. The Forth Bridge was a remarkable work, but some day something would be done to bring it a little more into sympathy with the landscape. He thought the bridge at Prague and the one at Toledo were excellent examples of the artist bringing the bridge form into harmony with the surroundings of the town. There was not a more picturesque example of a bridge than the one at Prague. Architects ought to be sufficiently well trained in engineering to be able, if they saw the engineer's first sketch of a bridge, to make sympathetic suggestions so as to give the design more relation to its surroundings and to suggest alteration for its improvement. The fault was that neither engineer nor architects knew quite enough to sympathise with the responsibilities of the other. The principal delight in bridge work must be its obvious integrity of purpose, open to the understanding of everyone.

Mr. Percy Young having spoken,

Mr. A. T. Bolton

said the bridge was immensely simplified when it had a natural setting—when there was a cliff from which it could spring, giving the idea that it united in a most perfect way with its surroundings. That was one of the great features of Waterloo Bridge, and he was not acquainted with any bridge which had the same beautiful finish; and the bridge was remarkable because the architectural element was so strongly introduced—the columns, though they had no practical structural purpose, were introduced in a way which made them never seem excrescences. London Bridge had a more utilitarian and compact aspect in the way the columns were introduced. He could not help thinking that at the beginning of the XIXth century there was a much better feeling between engineers and architects then had existed since. Engineers of that day seemed more disposed to work with architects and more disposed to artistic influence. Some of the mistakes of architecture among engineers were due to the deplorable summary of architecture which used to exist in engineering handbooks, and probably they did not exist now. Engineers got a sort of idea that all they had to do was to get hold of these summary facts and apply them. He could not see what we should not have bridges lined with shops, and as far as he knew there was no real objection to it. In the erection of future bridges there should be more co-operation between architects and engineers

Mr. Philpot having spoken

Mr. H. W. FitzSimons

said, as to reinforced concrete bridges, if a moving load were placed upon an arch, and if the arch had a very slight rise compared with the span, then provision had to be made for resistance to the tension stresses which came into the arch. No matter how the arch was shaped there must be a tendency to tensi stress. As to Conway Bridge, enginee regarded it with a little reverence as it was o of Telford's first bridges and one of the earlie structures of its kind. It had fully carried o its purpose until recently, when it had to strengthened. The sketches they had se were very beautiful, but think of designing su bridges nowadays! What would a Parliame tary Committee say to an engineer who pr posed the small spans of some of the riv bridges shown? Engineers had to provide no for as large a span as possible, as high a headwa underneath, and as low a gradient as possibl and it was difficult to bring all these poin into proper relation one to the other. T probability was that if engineers worked mo with architects better results would be obtaine but it was a difficult question as to where o was to leave off and the other commence, and was certainly difficult in regarding it from t financial point of view, for public bodies ackno ledged one of the professions, but would n acknowledge both. Some of the Continent steel bridges were beautiful structures, and he d not think exception could be taken to the A bridge was a structure intended to car traffic, and under present conditions the m who must design such a work was he w had been specially trained so to do, and he d not think that architects could deny this be the work of an engineer.

Mr. S. Bylander

said he did not think it was impossible to ma a steel bridge beautiful, and he instanced t Washington Bridge with its two large arch spa at least 500 ft. each; under one was the riv and under the other eight lines of railway. T bridge was entirely built of steel, and, to h mind, it looked beautiful. As to stress, it w interesting to look at the Brooklyn Bridge trains crossed, and see the movement of t members due to increased stress. A bridge w more interesting than a machine—a machi had regular movement, while the stresses in bridge varied greatly.

The Chairman,

in putting the vote of thanks to the meetin said that such meetings led to a better unde standing between the two professions. O could not help being struck by the way in whi engineers approached the question. One gent man said that Parliamentary Committees wou not agree to a bridge which contained as ma arches as the bridge at Limburg. Very like not; but Parliamentary Committees wou tolerate bridges expressive of the needs a the powers of design of the time. If th had been a Parliamentary Committee at Li burg they would have passed that brid with acclamation, because it was a brid which was thoroughly embued with the spi of its own age. If we could learn fr the past—if we could realise that the Rom bridge builders were as much artists wh they were building a bridge as when th were building a basilica, perhaps we should try to combine together—architects and en neers—to make our bridges always things beauty. If we could come to some agreem when a bridge is being designed to make beautiful, he thought it would be a gr advantage.

The vote of thanks having been carried v heartily,

Mr. Waterhouse,

in replying, said as to the great question betwe architects and engineers, he felt that the cr of both of them was so very big that neither them would ever get to the end of it. Th could not be giants combining both functions one, though the ideal solution of the questi was that designers should be almighty, comb ing both professions; then everything would very well! In the meantime he felt the probl was, so to speak, an insoluble one. There h been a seeming indication that he was f friendly to suspension bridges, whereas he h a great reverence for them. As to the Fo Bridge, he could only say that though it was as ugly as an ugly thing, it was nevertheless one the most wonderful things in the world. really ugly was not the right word to use was a compelling thing, and he mentioned ugliness only in order to emphasise the immen force it exercised on him and, he believed, everyone else who looked at it wonderingly a respectfully. It filled him with amazem every time he saw it, and it threw over all

conceived ideas of architecture and the rules rt. It was a thing full of spirit, life, and

The President announced that the next eting would be held on February 26, at p.m. (a combined meeting with the ieva, Sketch, and Debate Club), when a er would be read by Mr. F. C. Eden, tled "Hopes and Fears for Architec-."

RCHITECTURAL SOCIETIES.

Manchester Society of Architects.

n the 14th inst. Mr. A. N. Paterson read aper, entitled "Scottish Architecture, esiastic and Domestic, XVth to XVIIth turies." In tracing the history of the early elopment of Gothic art in Scotland he ved how till the XVth century Scotland owed in the wake of the general traditions building in England. That then, when land had passed to the Perpendicular od of flattened arches, fan vaulting, and endicular windows, Scotland, severed n English influence by the war, developed rchitectural character of her own. This maintained for the two following cen-es, but it was to France rather than land that she turned for friendship and iration. The time for the building of rches had now passed away, and Mr. rson showed with some excellent slides levelopment of the country house from the tower and castle.—A vote of thanks was osed by Professor Capper and seconded Mr. Hewitt and heartily carried.

Birmingham Architectural Association: Modernism *v.* Authority in Architectural Design.

a meeting of the Birmingham Archi-ral Association at Exchange-buildings, -street, on the 8th inst., Mr. Howard Smith delivered a lecture on "Modern-*v.* Authority in Architectural Design." entered a protest against the tendency ertain teaching of the day to stereotype lassical ideal in architecture, which was sed to the flexibility and versatility of l, and then spoke of the domination in ce and Italy of classic design of the two or three centuries, remarking that itional mediæval architecture had been letely suppressed, and that the influence he French schools of architecture in that tion had, in his opinion, been fatal to nore domestic, educational, and ecclesi-al architecture of the country, that of practice which must occupy the rity of professional talent. The prin-s on which he thought our schools of tecture should be conducted, and which sponded with the general trend of the bus of the Education Board of the Royal tute of British Architects, were, above hings, to teach the students to observe , and invent rather than to cram and ; that a sound general education should de entrance to the professional schools; the course of instruction should be pro-ive, commencing with elementary design construction, and leading up to an urs or post-graduate qualification; that ntimate association of construction and n as exemplified in the history of the architecture of the past, and inculcated eans of the school workshop and lecture-. should be insisted on throughout, n and draughtsmanship being empha-as essential elements of architecture; that, while the school course must be ly general and theoretical, the office e should supply the more practical part e training, and for encouragement should fered to advanced students to specialise.

Field Society of Architects and Surveyors: Support for Buildings.

. J. H. Cockburn, of Rotherham, by al request, gave a lecture before the ield Society of Architects and Surveyors e 8th inst. upon "The Law of Support Buildings." After dealing with certain ptional cases, he stated that the general was that a right to lateral support from ning property might be acquired for a ing which had enjoyed that support peaceably and without interruption for twenty years. He explained the circumstances in which the right of support might be acquired, and how it could be hindered, and within what time damages must be claimed. He then dealt with questions of liability where a contractor was employed, and with what had to be done for avoiding damages; and concluded by a short reference to support for party-walls and flats.

Mr. J. B. Mitchell-Withers (President) occupied the chair. A hearty vote of thanks was accorded, on the proposition of Councillor W. C. Fenton, seconded by Mr. E. M. Gibbs, and supported by Messrs. Roberts (on behalf of the Law Students' Society), W. G. Buck, C. B. Flockton, T. Winder, W. S. Purchon, J. E. Whitehead, A. C. Caporn, and the President.

Nottingham Architectural Society.

The fourth meeting of the Designing Club was held on February 13, the President, Mr. Robert Evans, presiding.

The subject set was, "A Carriage Porch and Entrance to an Hotel." Six designs had been submitted and Mr. F. E. Littler, Associate of the Royal Institute, who had prepared the conditions, gave an interesting criticism upon them. He remarked upon the general excellence of all the drawings and gave credit for the various good points in each, but called attention to the fact that some competitors had not followed the conditions in the matter of scale, etc., and impressed upon the students that it was a very important point in entering any competition to keep to the conditions.

Upon being asked to place the first three his award was as follows:—1, Garcon; 2, Carbon; 3, Fiasco.

At the close the President said they were greatly indebted to those members who gave their time to setting and criticising the designs in these competitions, and he proposed that their best thanks be accorded to Mr. Littler. Mr. Swann seconded, and it was heartily approved.

GENERAL NEWS.

The New Capital of Delhi.

Liverpool Health Committee recommend that the Council accede to the request of the Secretary of State for India that the Corporation should lend the services of their City Engineer, Mr. J. A. Brodie, to the Government of India for a few months to advise them as to the laying-out of the new capital at Delhi, subject to the Government making satisfactory arrangements with the City Engineer in regard to his remuneration and expenses, and to their refunding to the Corporation the amount of the City Engineer's salary during his absence.

London University Site.

In connexion with the provision of a site for London University it is announced that the Duke of Bedford has granted an option to purchase four plots of land, covering an area of nearly two and a half acres, near the British Museum. The plots lie on either side of the new avenue leading across Montague-place and Keppel-street into Torrington-square.

Hampton Court House.

Hampton Court House, the front of which faces the Green and the rear of which abuts on Bushey Park, is shortly to be demolished. Messrs. Knight, Frank, & Rutley have now submitted plans to the Hampton Council for the development of the grounds comprising the estate, and have asked the Council to state definitely that they would not object to the scheme provided the plans and general intentions regarding the buildings to be erected are otherwise satisfactory. The matter has been considered by the Council, who have replied that they will be prepared to consider favourably a proposal to construct a circular road, provided that complete plans are submitted showing the construction of the buildings in accordance with the Council's by-laws.

Suggested Sale of St. Botolph's.

Nothing has as yet been decided concerning the Church of St. Botolph Without, Aldersgate, which it was reported would be sold to make way for offices. It is stated on the authority of the Vicar, the Rev. C. O. Becker, that no proposal has been carried through, and that the question of sale is only under discussion.

Sanitary Building Construction.

A lecture on this subject by Professor Henry Adams, M.Inst.C.E., M.I.Mech.E., etc., illustrated with lantern slides, will be given at a sessional meeting of the Institute of Sanitary Engineers to be held at Caxton Hall, Westminster, S.W., on Monday, February 26. Mr. Edwin T. Hall, F.R.I.B.A., F.R.San.I., will take the chair at 8 p.m.

The Surveyors' Institution.

The programme of papers to be read at ordinary general meetings of the Surveyors' Institution during the remainder of the session has now been settled by the Council as follows:—

February 26 (afternoon meeting).—"The Tendency towards Uniformity in Compensation for Agricultural Improvements," by Mr. Leslie S. Wood (Fellow).

March 11. The adjourned discussion of Mr. Edwin Savill's paper on "The Single Tax Movement," to be opened by Mr. H. Trustram Eve (Fellow).

April 15.—"The Cost of Labour in Connexion with the Erection of Buildings," by Mr. R. M. Kearns (Fellow).

April 29.—"Some Principles in the Valuation of Land and Buildings," by Mr. G. T. Loban (Fellow).

May 13.—"The Mortgage of Real Estate as Affecting Values," by Mr. A. S. Cox (Fellow).

The Church Building Society.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 15th inst., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Frimley Green, St. Andrew, Surrey, 60*l.*; and Preston, St. Matthias, Brighton, 110*l.*; rebuilding the Church of St. Peter, Stanley, Yorks, 80*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Cropredy, St. Mary, Oxon, 10*l.*; Upwood, St. Peter, Hunts, 10*l.*; Southend-on-Sea, St. John the Baptist, 50*l.*; and Weymouth, St. Paul, 25*l.*; making in all 225*l.* Grants were also made from the Special Mission Buildings Fund towards building mission churches at Borth-y-Gest, Portmadoc, Carn., 20*l.*, making in all 50*l.*; Newport, St. James, Mon., 40*l.*; and Trebanos, Clydach, Glam., 40*l.* The following grants were also paid for works completed:—Hanborough, St. Peter, near Oxford, 25*l.*; Hoxton, Christ Church, Middlesex, 50*l.*; Hollinwood, Emmanuel, Lancs., 80*l.*; Forest Town, St. Alban, Mansfield Woodhouse, Notts, 100*l.*; York, St. Luke, 75*l.* on account of a grant of 150*l.*; South Bermondsey, St. Bartholomew, Surrey, 40*l.*; and The Brook Mission Church, Chatham, 30*l.* In addition to this the sum of 470*l.* was paid towards the repairs of nineteen churches from Trust Funds held by the Society. The Secretary reported the receipt of an anonymous contribution of 500*l.* to the Society's funds.

City of London Fire Inquests.

On Wednesday last week Dr. F. J. Waldo addressed, by invitation, the members of the Farringdon Ward Club at Anderton's Hotel. His subject was the history, working, and results of the City of London Fire Inquests, and, in the course of his remarks, he said that under the City of London Fire Inquests Act wide powers were conferred on the coroner to make private and preliminary investigations on his own initiative into any case of fire reported to him by the Police or the Fire Brigade Service. The method now in force is for the coroner and his jury to inspect the burnt premises, together with any officials the jury may wish to consult. Dr. Waldo stated that his predecessor, the late Mr. Langham, held eighty-five fire inquests, while he, himself, had held forty-eight between 1901 and 1911. The result of these fire inquests may be fairly inferred from the steady decrease of fires; during the

past five years there has been an average annual decrease of thirty-eight fires, as against that of the five years immediately preceding the passing of the Act in 1888. Again, in the year 1902, 47 per cent. of fires were reported as of unknown origin as against 25 per cent. in 1905. The proportion of serious fires has also considerably decreased; whereas the figures for the rest of London show a steady increase, both in frequency and in seriousness.

Theatre Royal, Worcester.

This theatre was destroyed by fire early on Monday morning last, and the only part of the building saved was the dressing-rooms. The theatre was rebuilt about ten years ago.

Clerk of Works to St. Paul's.

The Dean and Chapter of St. Paul's have appointed Mr. Bolwell to be their clerk of the works.

COMPETITION NEWS.

Port of London Offices.

We are informed by Sir Aston Webb that the date for sending in preliminary designs for this building has been extended from February 17 to March 9.

School, York.

The drawings submitted in the competition for the new elementary school in Campleshon-lane, York, were due to be sent in on Saturday last; 202 sets of designs were received.

The cost of the school, which will accommodate 550 in the boys' and girls' department and 250 in the infants', is not to exceed 10,000*l*. The assessors appointed by the committee are Messrs. T. Mellard Reade & Son, of Liverpool. The conditions were notable for the wide scope they allowed to competitors as to the type of school to be adopted.

Rhos Chair Eisteddfod.

Prizes of 10*l*. and 5*l*. are offered for a pair of workmen's cottages, Mr. Raymond Unwin, F.R.I.B.A., being the assessor. Clause 5 is as follows:—"The prizes will be paid in accordance with the adjudicator's award, but no competition will take place and the prizes will be withheld unless there are six entries at the least, received before May 6, 1912." This contradicts Clause 9, which says that designs must be sent in by May 1: but that is a minor point.

Municipal Buildings, Sofia.

In reference to the competition for Municipal Buildings at Sofia, H.M. Consul-General at Sofia writes as follows:—

"The prize for the competition for a design for the new Municipal Palace at Sofia was not awarded, but amounts of 3,250 francs and 2,250 francs were paid for the two best designs submitted by M. Nikola Lazaroff, Boulevard Dondoukoff, Sofia, and 1,000 francs for the third best, submitted by M. Nesheff, architect, Sofia. It is understood that the design for the palace will be based on the above plans, and at a later date the construction of the building will be put up to public contract." No responsibility is accepted in regard to the standing of firms or individuals mentioned.

CORRESPONDENCE.

Architects, Clients, and Specialists.

SIR,—Your leading article in last week's issue is so entirely true that one would wish every client could have the opportunity given him to digest it. Looking at the various points you raise, the first is that an architect cannot reasonably be expected to enlist the aid of professional specialists at his own expense. May I say that a considerable percentage of my work is given to me by architects who pay me out of their own pockets? I understand from them that their reasons for so doing are:—

(1) They will have unbiassed judgment.

(2) They do not have to place themselves under obligations to specialist sub-contractors, who will always assist an architect with an eye on the future.

(3) They reduce their risks of mistakes and even failures to a minimum.

A considerable proportion of my work is also for architects who have little difficulty in persuading their clients to pay two commissions.

That is to say, the architect receives his usual fees on the whole of the work, and I also obtain my usual fees on my part of that work.

Every client in such cases has, so far, realised that he was benefiting by doing so.

PROFESSIONAL SPECIALIST.

Trade Unionism and Restraint of Trade.

SIR,—On page 181 2 of your issue dated the 16th inst. you quote at length from an article appearing in the *National Review* by the Countess of Stradbroke on "Trade Unionism and Character." Based upon a statement that the trade union prevents the bricklayers from laying more than a given number of bricks per day, deductions are made and arguments advanced claiming that the trade unions operate in restraint of trade and are inimical to the interests of the community.

I hold no brief for the trade unions, but, during a lifetime spent in the building trade I have seen this statement very often, both in your pages and elsewhere.

Is it a true statement, or is it untrue?

If it is true, surely some of the many builders who read your pages can give us uncontradictable facts and data which will put it beyond question. If it is untrue, then, in justice and fairplay, let it be stopped. My own experience may be given for what it is worth. For some years I was a member of a trade union; there were no by-laws or rules in that union which in the slightest degree had a bearing upon how much or how little work a member had or had not to execute. I attended many branch meetings in three of the principal cities; at no meeting have I heard the question raised or discussed. I have met thousands of trade union workmen, and still have never known the question to be raised. Indeed, my experience has been to the contrary; I found that a lazy workman or a malingerer was deprecated by the union officials. For sixteen years I have been supervising the erection of large public buildings in the north, south, east, and west of England, and yet I have not known of an instance in which the trade unions have interfered with the quantity of work executed by any one of their members. But as the statement is generally applied to bricklayers, I have procured a copy of the full rules and by-laws of the Operative Bricklayers' Society. It is on the table before me now. I have carefully searched page by page and cannot find the slightest reference to the quantity of bricks its members may or may not lay per day, nor can I find anything which has the remotest bearing on the subject or anything which could possibly be strained into having a bearing on the subject. I have questioned the bricklayers (unionist and non-unionists) on my buildings, and from all I have had the same reply—the unions do not interfere with their members regarding the quantity of work they may or may not do.

In the face of these inquiries and my own experience, am I to believe that if a bricklayer lays more than a given number of bricks per day the union finds fault or restrains him?

Amongst architects and the public generally the statement is commonly believed—it is quite accepted as true—that the union restricts the output of the bricklayers. We have it reiterated by the Countess of Stradbroke in the *National Review*.

Is is conceivable that on some buildings the bricklayers (both unionist and non-unionists) have put their heads together and agreed they would not lay more than a stated number of bricks per day—personally I have never met with this experience—but what has an occurrence of this description got to do with the trade unions? It would happen just the same if there were none, and in any case must be extremely rare. The value of the Countess of Stradbroke's article depends entirely on the correctness of the statement that the trade unions prevent their members from doing more than a given quantity of work per day, and if this is incorrect, her article is of no value because her deductions must all be wrong. She refers particularly to the bricklayers, and I maintain that this statement with reference to the bricklayers' trade union is not in accordance with facts. Owing to the labour unrest, the subject is one of particular interest at present, and may be discussed with great benefit. X.

INTERCOMMUNICATION COLUMN.

Public Swimming-Baths.

SIR,—Will any of your readers who have practical knowledge of the initial expenses and cost of upkeep of a public swimming-bath in a village give the benefit of his experience? I thought of having two or three private baths under the same roof, which may be filled with hot water. What is now considered the most economical way of heating water for this purpose? Has there been any improvement on the geysers? What charges should be made to ensure a bath being self supporting, and to what number of bathers? How should the caretaker be arranged for? The village contains about one thousand inhabitants.

WELWYN.

Echo.

SIR,—I wonder if any of your readers would be able to give me any information as to what is the easiest way to cure an echo? Some six months ago I completed a ballroom in Cheshire, which is 50 ft. long by 25 ft. broad, with a bay-window in the centre of one of the side walls and a fireplace recess opposite. The roof is segmental in form, springing off the cornice, 15 ft. from the floor level and rising to 19 ft. in the centre. This room is used as a music-room on ordinary occasions, so this echo (which mercifully is not very bad) is a distinct nuisance. Naturally I wish to avoid having to stretch unsightly wires across if this can be in any way prevented. Thanking you in advance, A BEGINNER.

Staircase, Devonshire House.

SIR,—Can you or any of your readers give some account of the staircase at Devonshire House, especially the handrail? Or say where a description is to be found? R. C.

FIFTY YEARS AGO.

From the *Builder* of February 22, 1862.

St. Thomas's Hospital.

TWO VERY important questions present themselves with reference to this hospital—the question of site and that of architectural design and arrangements. The *Times*, in speaking as to site, appears to consider that those who, like ourselves, have urged the advantages of a suburban site for the recovery of patients, contemplate nothing less than the total removal of the hospital and all its appendages; whereas, so far as regards ourselves at least, we have ever kept in view the necessity and advantage of having an establishment connected with the hospital placed somewhere in the neighbourhood whence it is about to be removed. As for the immense advantages of a suburban site to the recovery of the patients—which surely is a question above all else for consideration—there cannot be a doubt, and if the governors are unwilling to remove the principal establishment from London, with such means as they possess—between 30,000*l*. and 40,000*l*. a year, and rapidly on the increase, besides a very large sum from the railway company for the express purpose of building the required new hospital—surely they ought at least to have an extensive establishment also in the suburbs, within easy time distance from their town establishment, and whereto every possible case could be transferred at the earliest available moment.

EDITORIAL SUMMARY.

Our leading article deals with Labour Questions and Nationalisation and Insurance.

A second article on the "Architectural Societies of France" refers at length to La Société des Architectes Diplômés par le Gouvernement (p. 200).

In "Notes" Column (p. 201) will be found observations on: "Victoria and Albert Museum"; "The Society of Twelve"; "Bridges"; "Site for London University"; "Further Improvement for the Marble Arch."

A meeting of the Royal Institute of British Architects was held on Monday, when Mr. Edward Warren read an interesting paper on "Collegiate Architecture." (See p. 202.)

Our report of the combined meeting of the Architectural Association and the Junior Institution of Engineers, when a paper on "Bridges" was read by Mr. Paul Waterhouse, A.A., is continued on p. 204.

In Architectural Societies (p. 207) will be found short reports of: "Sheffield Society of Architects and Surveyors"; "Birmingham Architectural Association"; "Nottingham Architectural Society."

In Correspondence columns (p. 203) will be found letters on: "Trade Unionism and Restraint of Trade"; "Architects, Clients, and Specialists."

The Monthly Illustrated Review of Engineering (p. 211) includes: "Reinforced Concrete in Great Britain"; "Æsthetic Treatment of Concrete"; "York Tower Collapse"; and Notes.

In the Building Trade Section (p. 215) will be found: "How to Cheapen Transport"; "Manchester Building Trades Exhibition"; "Standard Time Rates of Wages"; "Builders' Clerks' Benevolent Institution."

The last of Professor Reginald Blomfield's Royal Academy lectures on "Architectural Draughtsmanship" was given on Thursday last week, and an abstract appears on p. 218.

The fourth of the present series of Carpenters' Hall lectures on "Arts Connected with Building" was given on Wednesday last week by Mr. Stirling Lee, the title of whose address was "The Sculptor's Craft," with demonstrations. (See p. 218.)

Book Notices (p. 219) include: "Memorials of Old Gloucestershire"; "Laxton's and Lockwood's Price Books"; "Everybody's Guide to the National Insurance Act."

An article on the "Traffic Report of the Board of Trade" is given on p. 220.

In Legal Column (p. 221) are some observations on: "Obstruction to Light"; "Mistake at an Auction."

In Law Reports (p. 221) will be found: "Padbury *v.* Holliday & Greenwood, Ltd."; "Chapman *v.* Greenwood, Ltd."; "London County Council *re* Euston-road Building Line."

MEETINGS.

FRIDAY, FEBRUARY 23.

The Royal Institution.—Mr. George K. B. Elphinstone "The Gyrostatic Compass and Practical Applications of Gyrostats." 9 p.m.

Royal Academy of Arts.—Mr. A. P. Laurie, M.A., D.Sc., on "The Chemistry of Pigments." 8 p.m.

Leicester and Leicestershire Society of Architects. Paper by Mr. H. L. Goddard, M.A., entitled "Rambles and Reminiscences." 8 p.m.

Institution of Civil Engineers (Students' Meeting).—The Vernon-Harcourt Lectures on "Works for the Prevention of Coast Erosion," by Mr. W. T. Douglass, Assoc.Inst.C.E. 8 p.m.

SATURDAY, FEBRUARY 24.

The Royal Institution.—Professor Sir J. J. Thomson, M.A., D.Sc., on "Molecular Physics"—I. 3 p.m.

Builders' Foremen and Clerks of Works' Institution.—Annual dinner, Holborn Restaurant. 6 p.m.

MONDAY, FEBRUARY 26.

Architectural Association (Combined Camera, Sketch, and Debate Club Meeting). Mr. F. C. Eden on "Hopes and Fears for Architecture." 7.30 p.m.

Royal Sanitary Institute. Mr. Alan E. Munby, M.A., on "Elementary Science Physics, Chemistry." 7 p.m.

Institute of Sanitary Engineers (Caxton Hall).—Professor Henry Adams on "Sanitary Building Construction." 8 p.m.

The Surveyors' Institution.—Mr. Leslie S. Wood on "The Tendency Towards Uniformity in Compensation for Agricultural Improvements." 5 p.m.

TUESDAY, FEBRUARY 27.

The Royal Institution. Professor Ernest G. Coker, M.A., D.Sc., on "Optical Determination of Stress, and Some Applications to Engineering Problems"—I. 3 p.m.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., on "Elementary Science: Physics, Chemistry." 7 p.m.

Nottingham Architectural Society.—Mr. W. Bond on "Church Restoration." 8 p.m.

Northampton Polytechnic (Illuminating Engineering).—Dr. W. Ettles on "Physiological Factors in Illumination." 7.30 p.m.

Institution of Civil Engineers.—(1) Paper to be further discussed. "Some Features of the West African Government Railways," by Mr. F. Shelford, B.Sc; (2)—time permitting—papers to be read: "Roller and Ball Bearings" and "The Testing of Anti-friction Bearing Metals," by Professor John Goodman. 8 p.m.

WEDNESDAY, FEBRUARY 28.

Carpenters' Hall, London-wall (Lecture on Arts Connected with Building). Mr. M. H. Baillie Scott on "House Building, Past and Present." 7.45 p.m.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., on "Elementary Science: Physics, Chemistry." 7 p.m.

Royal Society of Arts.—Mr. H. A. Roberts, M.A., on "The Relations of Science to Commerce and Industry." Principal Sir Henry A. Miers, M.A., D.Sc., F.R.S., in the chair. 8 p.m.

THURSDAY, FEBRUARY 29.

Carpenters' Hall (London-wall).—Mr. Banister F. Fletcher on "The Tower of London." 8 p.m.

Society of Antiquaries.—8.30 p.m.

FRIDAY, MARCH 1.

Royal Sanitary Institute. Mr. Edward Willis on "Calculations, Measurements, and Plans and Sections." 7 p.m.

Glasgow Architectural Craftsmen's Society (Technical College). Mr. Robert Moon on "Various Timbers and their Practical Uses." 7.45 p.m.

Institution of Civil Engineers (Students' Meeting). Mr. H. J. F. Gourley, B.Eng., on "The Design and Construction of Masonry Dams." 8 p.m.

ILLUSTRATIONS.

Stafford Public Library.

LAST week we noticed some of the competition designs sent in for the Stafford Public Library, and we now illustrate the design placed first and the second and third premiated designs.

The authors of the design placed first, Messrs. Briggs, Wolstenholme, & Thornely, FF.R.I.B.A., of Liverpool and Blackburn, write:

"The building is entirely isolated from others which may be hereafter erected on the adjacent site, which safeguards it against fire, and secures many other advantages. An alternative boundary line is suggested to that given in the instructions, which would enable the building to occupy rather less land. The principal entrance is placed at the apex of the site, the same being emphasised by a semi-circular portico boldly treated, forming a striking architectural feature as viewed from Bridge-street. The entrance hall, which is spacious without being wasteful, gives direct access to the ladies' room, newspaper-room and magazine-room, and also to the lending library. Close to the entrance a public telephone-box is provided, which enables it to be used without bringing the public far into the building.

Immediately facing the principal entrance, after passing through a pair of swing doors, the borrowers' counter, with indicators, is placed, at the rear of which are the book stacks in slightly fan-shaped form.

The position of the attendants' space in the lending library is such as to ensure their commanding a complete view of the whole of the lending department, news and magazine and ladies' room, and entrance hall.

This department is well lighted by means of a series of dome lights, each of which is provided with ventilating extractors. The windows in the east wall are provided mainly for the purpose of ventilation. The book stacks are 7 ft. high, and accommodate 12,000 volumes, as shown on the plan.

The newspaper-room runs uninterruptedly along the frontage to Bailey-street. Large windows are spaced evenly along the external wall, sufficiently high above the floor to allow newspaper wall stands to be placed under them; the centre of the rooms in which the tables are placed is, therefore, not obstructed by high fittings.

The magazine-room and ladies' room occupy the frontage towards Lichfield-road, and it is suggested they should be divided by glazed screens architecturally treated, which will facilitate supervision and give a more spacious effect to these rooms.

The book store is placed in convenient relation to the lending department, and is in close connexion with the reference library by means of the book lift and staff staircase.

The staff lavatory is adjoining the staff entrance. The cleaners' sink-room is provided under the staircase near the entrance, from which a staircase leads down to the heating chamber.

The reference room is placed upon the first floor, and is lit with vertical lights placed on either side high up in the room above the book stacks, which it is suggested should be placed round the whole of the room. The librarians' office is also provided on this floor, and is approached either by means of the staff stair from lending library or through the reference library, which it commands. The caretaker's day-room is also suggested on this floor, which would ensure the reference-room being under supervision during the whole day.

We have suggested the possibility of a future lecture-room. It is quite probable that this will be built immediately, with lecturers' retiring-room over the staff lavatory.

The heating chamber has been placed in the basement on the Bailey-street frontage, with a coal shoot, so that coal and coke may be tipped direct from the side street into the coal-cellar. Access to the heating chamber is obtained under the staircase, so that the caretaker would not have to traverse the library from his day-room in attending to the heating.

The walls will be constructed of common brick, faced with approved wire-cut facing bricks or sand stocks 2 in. thick. The stone dressings to be of Hollington or other approved stone which has been found to weather well in the neighbourhood.

The ground floors throughout to be of Portland cement concrete, with 1-in. floated surface finished with cork linoleum. The entrance vestibule to have a floor of black and white marble.

The first floor would be constructed of fireproof flooring and floated with cement finished with cork linoleum, as provided on the ground floor. The whole of the internal woodwork to entrance hall, borrowers' counter, and screens on ground floor will be of American white oak quarter cut. The internal woodwork of other parts of the building to be of American whitewood stained oak colour and dull polished. The building will be lighted by electricity, with drop pendants arranged in suitable positions for the readers. The heating will be on the low-pressure hot-water system, the boiler being the National Radiator Company's "Ideal," or other suitable pattern. Ventilating radiators will be placed under the windows and in other suitable positions. Ventilating flues will be provided to all the rooms terminating on the external face of the walls. A small fan will be provided in the ceiling of the reference-room.

An endeavour has been made in planning the building to let the elevations express the plan in a simple and dignified manner."

Messrs. Sutton & Gregory, of Nottingham, the authors of the second premiated design, write:—

"In preparing our design it has been our endeavour to arrange the public rooms in such a manner that perfect supervision is obtained with a minimum of staff. The attendant in the lending library has direct supervision of the staircase to the upper floor, entrance hall, newsroom, and magazine-room. The rooms on the first floor are under the immediate control from the librarian's-room.

The magazine-room and reference library are on the right of the entrance hall and away from the noise of the traffic of the main road. The newspaper-room and ladies' room and librarian's office are on the left of the entrance hall. The caretaker's-room is placed on the ground floor, near the back entrance and heating chamber, and also in direct communication with the staff in the lending library. A store is placed in this room for the preparation of meals. The following accommodation is provided on the ground floor:—Newspaper-room, 822 super. ft.; magazine-room, 600 super. ft.; lending library, 913 super. ft., with shelving for 12,800 volumes; book store, caretaker's-room. On the first floor—reference-room, 714 super. ft.;

ladies' room, 350 super. ft.; librarian's office, 351 super. ft.

The cubic contents are as follows:—

Foundations, 16,800 ft. at 5d., 350*l.*; superstructure, 84,840 ft. at 10d., 3,535*l.*; boundary wall, etc., 100*l.*; total, 3,985*l.*"

Third Premiated Design.

The authors of the third premiated design, Messrs. Castle & Warren, Norfolk-street, Strand, London, write:—

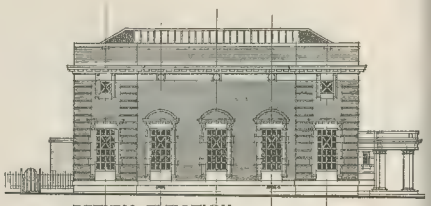
"The intention of the authors of the third premiated design was to embrace the accommodation by taking up the smallest possible amount of space on the site, thus to arrive at a compact scheme from the points of view of limitation of cost and concentration of supervision. In this way all the rooms are supervised and controlled by a staff of three (two at the service counter, and the librarian in a central position upstairs) and a porter on the entrance.

The ell-shaped lending library in this particular case is considered a great advantage, and the required storage of volumes was just provided for, and the 40-ft. length of counter as required.

The magazine-room in actual practice being frequented only as a rule by quite desirable readers, no objection was seen to the position of the ladies' room, and none would be felt in actual execution.

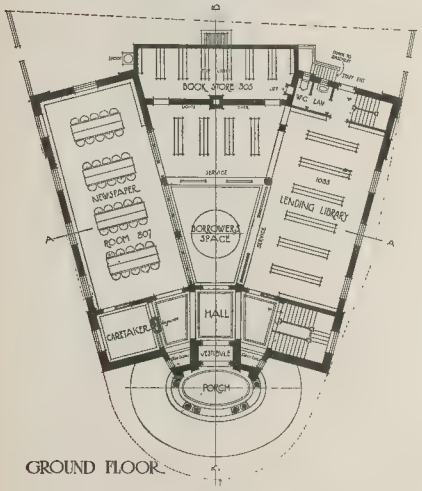
The scheme was entirely dictated by the cost, and the elevations were based on extremely simple lines in view of this."

Bridges.



THESE two illustrations, from water-colour drawings by the late Mr. Alfred Waterhouse, R.A., are given in connexion with the lecture on "Bridges" which Mr. Paul Waterhouse recently delivered before the Architectural Association, the second part of which appears on another page. The drawings and many others by the same artist were shown on the occasion of the lecture.

GREEN PARK ALTERATIONS.



The Broad Walk of Green Park is now being reconstructed. Instead of the wide path which was opened from Buckingham Palace gate to Piccadilly a few years ago, two gravel paths of about 15 ft. wide each are being constructed at either side, and the Broad Walk is being placed under turf, thus making a large green space about 150 ft. wide continuing the length of the walk. It is understood that the intention is to leave this ground treeless, so that a clear view may be had of the Victoria Memorial from Piccadilly.

MONTHLY REVIEW · *of* · ENGINEERING.

FORCED CONCRETE IN GREAT BRITAIN.—II.

By W. Noble Twelvetrees.

(Continued from page 98.)

Classification of Systems.

various systems of reinforced concrete mployed in Great Britain may be onveniently considered under two eads:—

ose representing a special arrangement ary steel bars, rods, wire, or strip ing the reinforcement, and in which orcing units are prepared as may be on the site of the works to be executed, r having been placed and temporarily the moulds as required by the working are afterwards held in position the embedding concrete; and

ose characterised by the employment lly formed bars or meshwork, or of s to which special types of auxiliary ment are attached in suitable manner.

ld be noted that systems of class (*a*) ly intended to provide for the applica- steel to such parts of the concrete as reinforcement for the resistance of ompressive, and other stresses. Their s believe ordinary mercantile forms o be quite adequate, more convenient, costly than specially formed bars. e is no reason why any of the systems on should not be applied in connexion e of the special types of reinforcement narket if such a course were thought

gh certain details in most systems of are protected by patents, the firms making a speciality of the systems appear to be gradually acquiring a status somewhat akin to that of structural engineers generally, and their experience is probably considered by clients to be quite as valuable as the system with which each of them is identified.

While systems of class (*b*) are distinguished by the various special forms of reinforcement employed, such types of reinforcement do not in themselves constitute a "system" strictly so called, and it is necessary that the reinforcement should be applied in accordance with the fundamental principles of reinforced concrete construction. Special bars and auxiliaries do not in any way obviate the need for scientific design, and it should be clearly understood that purchasers must either have at command the requisite technical knowledge or procure designs from the firms by whom the reinforcement is sold. Most of these firms lay themselves out for the preparation of designs, and consequently are very much in the same position as specialists having systems placed under class (*a*).

In the following summary the characteristics of the principal systems are given briefly, with special regard to the uses of reinforced concrete in building practice, and attention has been confined to systems suitable for the design and construction of complete buildings

Systems of Class (a).

Hennebique System. In 1879, when engaged as a contractor for public works and buildings, M. François Hennebique constructed reinforced concrete floors, and ever since that date has been connected with the same class of construction. In 1892, being then established in Brussels, M. Hennebique first introduced a clearly defined system as set forth in his British patent of 1892 relating to "improvements in the manufacture or construction of joists, girders, and the like." The complete specification claims, among other things, the assemblage of two appropriate materials, such as iron and cement, in such manner that the tensile resistance of one material is added to the compressive resistance of the other material; the combination of the two substances in such manner that the one subject to tension is embedded in the lower part of the substance on which the effects of compression are to be exerted, and the upper part only of which becomes of use; the use of round, square, bent, or other bars (*B*) and cement of trapezoidal section (*P*) as being the most practical arrangement; and the use of anchors (*A*) of any suitable form or section, forming with the cement a complete and indissoluble union of the lines of tension and allowing the application to the reinforced beam of the methods of calculation for lattice work girders, such anchors being placed at intervals determined by calculation. Fig. 1 includes transverse and longitudinal sections of beams constructed as described in the specification, which evinces a correct appreciation of the principles of reinforced concrete design as accepted in the present day.

Two British patents taken out in 1897 denote the development of the Hennebique system to the form in which it is now employed in the construction of beams and floors.

One of these patents describes a beam built in at the ends or continuous over one or more intermediate supports, the reinforcement consisting of straight and bent bars and U-shaped stirrups arranged as shown in section Fig. 2, and in perspective by Fig. 3. The bent-up

bars are carried into the wall in the case of a built-in beam, or taken for some distance over the intermediate supports in continuous beams. The stirrups, now made with a kink as in Fig. 4 to make them grip the main bars, are spaced more and more closely together near the ends of the beam to form a triangle of resistance outside each point of contraflexture. Fig. 5 represents the arrangement of the bars and stirrups for a beam having both tension and compression reinforcement. Floor slabs are reinforced similarly to beams, and are applied so as to act as compression flanges to the beams projecting below them.

The other patent of 1897 provides for the construction of hollow floors composed of slabs moulded in advance and beams moulded on the site. This method has been employed in this country chiefly for the construction of floors for cold storage, the hollow being partly filled with insulating material. It may be regarded as the precursor of several floor systems since introduced with the object of reducing the quantity of centring required, and possibly suggested the Hennebique type of hollow flooring illustrated in Fig. 6. This floor is formed by placing fireclay or concrete tubes in rows on planks temporarily supported by posts, the spaces between the tubes forming moulds for the beams and the upper surface of the tubes forming centring for the covering layer of reinforced concrete.

Columns and struts as originally designed in this system were reinforced by four or more longitudinal bars connected at intervals by flat plates in sets of four, the bars passing through holes in the plates. Such members are now made with sets of wire links (see Fig. 7) as transverse reinforcement in accordance with the patent of 1904.

Column bases are reinforced, as shown in Fig. 8, by two or more sets of bars crossing one another and connected by stirrups similar to those employed in beams.

By the aid of structural elements of the general classes described the foundations, skeleton frame, floors, and roof for a building can be constructed, leaving only walls for consideration. These are usually reinforced by a series of vertical bars near each face of the concrete and a series of horizontal bars in the middle of the wall, the vertical bars being provided with stirrups similar to those used for beams.

A type of reinforced concrete wall patented in 1908 was illustrated and described in the *Builder* of November 26, 1910, to which readers are referred for particulars. This wall consists of special concrete blocks reinforced by a network of rods and jointed by cement mortar in the horizontal and vertical grooves pro for reception of the reinforcing bar.

Among the advantages claimed for the H bique system as employed in this countr Messrs. L. G. Mouchel & Partners, Ltd Westminster, are the following:—

(1) That the sloping portions of the up bent bars in beams lie fairly across the of possible rupture near the supports, and the vertical stirrups, being closely space the same portions of the beam, int numerous lines of maximum tension which considerably in direction.

(2) That the vertical position of the st facilitates ramming without risk of their placement, and that the spring clip at bottom dispenses with wedges and wire t

(3) That the successive sets of trans links in columns are more effective in bu the bars and concrete in every direction a circumferential winding or circular bands

Finally, we may state that work on Hennebique system is executed only by lic contractors, for whom the patentees pr working drawings and quantities based the general designs of the architect or eng that the patentees hold themselves respon for the efficiency of the reinforced co designs, and that the contract price cove payments to the patentees.

t System.—The late François Coignet, , whose British patent of 1855 has been mentioned, was one of the first beate the advantages to be derived b combination of iron and concrete in al practice, although it does not appear made any important use of reinforced His son, M. Edmond Coignet, himself to a study of the subject, 888 and 1894 read papers on reinforced theory and design before the French of Civil Engineers. The second of o papers attracted considerable atten- the part of Continental engineers, and rthy of note that the views therein t have been in great measure con- y the investigations of various scientific ies.

Paris Exhibition of 1900 afforded M. as well as other pioneers, a good ity of demonstrating the valuable es of reinforced concrete and of making known the utility of the system which time he had formulated on a practical

irst British patent relating to the system was taken out in 1904, and is "Improvements in and connected with ld or armoured concrete construc- nd in the same year the system was d into this country. In the complete ion, after stating his knowledge has been previously proposed to use forms of metallic reinforcement for construction, as described, for example, cation No. 3,377, A.D. 1883, strengthen- in the upper parts of concrete beams s to resist tensile stresses, helical coils ngs for pipes, culverts, piles, and the metal bars or members for resisting nd compressive stresses in concrete ions generally," the inventor makes ving claims:—

e method of tying together the rods the reinforcement of beam flanges and r bars in the compression area of beams g over the rods the ends of the web ties C in Fig. 1) which connect the tension pression bars of the reinforcement.

e method of reinforcing column bases illustrated by Figs. 3 and 4.

thods of arranging the reinforcement circular tanks, and spherical domes, roofs or arches.

r first with beams as described in the nt, it should be pointed out that the ment preferably consists of round steel that while the general principle is to steel for resistance to tension and upon for resistance to compression, yet in the concrete is usually reinforced by on bars (B, Fig. 1), partly for the of reducing the dimensions and dead the members, and partly for the pur- providing for the connexion of the ad compression areas by means of the (C), which are secured by annealed The latter are arranged at distances by calculation, and may be placed but the vertical position is always n practice. In cases where a number n bars (A, Fig. 1) are used, cross- steel may be provided so as to distribute es over all the bars. Beams, flanges, cting floor slabs are reinforced by rods (*a*) and secondary rods (*b*), e intersections by annealed wire, as it should be noticed that these rods down on each side of the beam so as hem as near as possible to the tension e the concrete. Where a very heavy to be constructed the reinforcement f both tension and compression bars by web ties, the arrangement being as that adopted for beams.

re to which importance is attached e wiring together of the bars and ives assurance that their position will ered during the process of concreting, enables the contractor to prepare the etons in advance according to the rawings.

shows a special arrangement by which ng for floor slabs may be supported moulded in advance. The main bars m project about a foot at either end xion to the supports, and the ends of ies project above the beams, so that be embedded in the concrete of afterwards moulded on the site. beams have been fixed, the centring planks secured by bolts passed through holes made for the purpose in the beams at the time of moulding.

Columns of the Coignet type are made of any suitable sectional form, the reinforcement consisting of four or more longitudinal bars bound by horizontal ties or a spiral winding of stout wire or thin steel rods, the lateral reinforcement so formed being held in place by annealed wire. Figs. 3 and 4 show part of a column as described in the specification of 1904, and the manner in which the column base is reinforced.

An alternative type of beam construction is the subject of a patent taken out in 1906, the object of the invention being to provide a reinforcing framework without requiring the web ties involved in the patent of 1904. This framework, illustrated in Fig. 5, comprises a group of tension bars of different lengths, the ends of most of these being bent up at an angle of about 45 deg. and hooked over a compression bar, while the bars are bound together by vertical ties of annealed wire, as shown in the drawing. Additional bars are placed over the intermediate supports of continuous beams to withstand tension due to negative bending moments. The bars in each group are kept about ¼ in. apart to allow the concrete grout to surround each individual bar. As in the case of the other beam design, the skeleton framework can be built up in advance, and the position of the bars cannot well be altered by the work of concreting.

Fig. 6 is a diagram representing the various types of Coignet members already described, and including also part of a wall panel with the method of reinforcement adopted under this system.

The chief advantages claimed for the Coignet system may be thus briefly stated:—

(1) In beams the reinforcement can be completed beforehand and put into place as a complete skeleton, the parts of which cannot be displaced accidentally by the deposition and ramming of concrete.

(2) The form of beam reinforcement with bent-up bars saves both labour and material.

(3) Beams can be moulded in advance and used to carry centring for floor slabs, thereby saving material and labour.

Work on the Coignet system is carried out by licensed contractors, whose estimates or tenders include provision for the drawings and other technical details prepared by the patentees in accordance with the general designs of the architect or engineer under whose superintendence the works are executed.

THE ÆSTHETIC TREATMENT OF CONCRETE.

Sir Henry Tanner, F.R.I.B.A., presided over a meeting of the Concrete Institute on February 8, at Denison House, S.W., when the discussion was resumed on the paper which Professor Beresford Pite read before the Institute on June 7 of last year.*

In view of the length of time which had elapsed, the author again read his paper and afterwards exhibited a number of lantern slides of ferro-concrete buildings. He pointed out where in practically every instance æsthetic treatment was lacking.

Mr. A. Alban H. Scott

remarked that with this new material problems arose which did in every way alter constructive work. One point brought out recently was the treatment of floors. In other materials it was necessary to introduce beams of greater depth than the floor itself, but now with reinforced concrete they were able to keep the whole of the ceiling flat. He thought this was a proper and legitimate treatment of the material, although perhaps it would not conform to the grammar of architecture. He did not think concrete necessarily required coarse treatment, but it should be treated with the highest degree of refinement.

Mr A. T. Bolton

said what to do with a new material involved a vast amount of thought. Many of those present would probably like the best analysis of that very difficult subject. It was Garbett's "Architectural Design," which was written about the time of the Gothic revival and contained a good many things which would be considered absurd nowadays. The main lines of it were, however, remarkably good, and there was a very curious prophecy in the book which the photograph of the goods station at Newcastle-on-Tyne showed had actually been realised. Garbett summed the whole thing up by saying, "In Greece we have the architecture of the post and lintel, and in Rome we have the architecture of the arch, and there is no other constructive principle except that of the truss." In a building like the Vere-street Post Office they saw the truss employed on an enormous scale. There was a question of whether this reinforced concrete was known to the Romans, and he would suggest to the engineers that they should consider the subject of the cold-water bath of Caracalla in Rome. It was an enormous hall, and ancient writers told them that its ceiling was one of the marvels of Rome. It was flat, and had three or four large openings for lanterns. How did the Romans support a ceiling of that gigantic scale, flat, and with these openings in it? Professor Lanciani mentioned that when the cold-water bath was explored great quantities of T-irons were removed. The engineers might consider in what way with the aid of T-irons and concrete they could restore this wonderful roof of the Romans. There was no doubt that Roman construction was extraordinarily vast, and anyone who wandered about Palestine Hill and Hadrian's Villa and saw the great apses and wonderful vaults must come to the conclusion that the Romans had little to learn in this regard. He knew that the roof of the Pantheon had some extraordinary truss construction of flat bars of bronze. There was a sketch of it by Raphael, but the bronze was afterwards melted down. The Romans reinforced their concrete with quarry tiles, by which they counteracted the shrinkage and other defects of concrete. They had only one text-book on architecture descending from the Romans, and that was by Vitruvius. It was, however, the work of a provincial architect, who seemed to have copied what he might term the War Office specifications of the period. He held that there were some Roman specifications issued by the Army, because in every part of the world they found the Roman walls uniform. The secret of Roman concrete was to him absolutely unknown. He was very familiar with the Roman fortress known as Richborough Castle near Sandwich, which was still surrounded by a great Roman wall. The wall was 20 ft. high and 10 ft. thick, but when the railway was being built the barbarians destroyed the sea wall, and on the return wall they excavated a great opening which was high enough to walk under and was over 8 ft. in depth. The span of the opening was 50 ft., and yet this wall had remained in such a state for sixty years without the slightest sign of cracking. So far as one could see, the wall was constructed of nothing but the materials on the spot, and the mortar seemed to be ordinary chalk mortar. What was it, then, that the Romans mixed with the mortar to transform it into a material as hard as our Portland cement? When the Romans left the country, whatever used to be done to the mortar ceased to be done, for when the Normans attempted to do buildings of a Roman character they made a fearful mess of it. Turning to another aspect of the question, he thought in mica they had an opportunity of lighting up the surface of concrete, and there were also considerable opportunities by the use of acids in removing the excess of cement over certain portions. Professor Pite had rather omitted the Byzantine period, but it was in Byzantine times that Roman architecture found itself. Byzantine buildings were Roman buildings released from the bondage of the Orders. The whole question of shams was worth serious consideration, for, after all, in architecture the effect of beauty had to be attained.

Mr. E. P. Wells

considered there was no reason why the usual architectural methods should not be adopted in the treatment of concrete. It was artificial stone in the same way that brick was artificial material, and he could see no reason why it should not be moulded and treated in a proper manner so as to be pleasing to the eye.

* The paper was printed in the *Builder* for December 29 last.

Mr. E. Fiander Etchells
remarked that the problem had two sides; the first was whether they should consider ferro-concrete as a material which should be announced naked to the world. The second was whether they should deal with it only as a skeleton, and clothe it with some other material until the architects themselves decided into which category they would put it. He would express no opinion, especially as architects seemed to judge solely by their feelings, and feelings were unreliable things.

Mr. H. Shepherd
thought it was permissible to use joints in concrete, and suggested that the joint should be made where each day's work began. In one of the earliest examples of Greek art—the Colossus—they had a great wall made of unburned brick, which was plastered over, and in this was moulded large figures. That was a possible suggestion for the treatment of a ferro-concrete building.

Professor Pite,
in reply, said it was impossible to imagine a system of proportion for a new material apart from those ideas of proportion which they derived from others. The subject before them wanted study, but it could only be undertaken by a serious study of architecture.

THE YORK TOWER COLLAPSE.

IN the course of an inquest at York extending over six days into the death of Arthur Bowman, cabinet-maker, the victim of the collapse of a York clock-tower.

Mr. William Black, of Leeds, the district manager for the Trussed Concrete Steel Company, Ltd., said his firm did not undertake any responsibility for the material and workmanship of the ferro-concrete. He believed, however, the work was carried out in accordance with their plans and drawings. In a letter to the architect he referred to the necessity of a clerk of works to superintend the work, but he believed that on this job there was no clerk of works in the strict sense of the term. Witness said he was not aware till after the accident that one of the beams, known as R23, was not put in its proper place.

By Mr. Kay (for the architect, Mr. Monkman): He did not find any fault with the work which the contractors were doing.

By the Coroner: He accepted responsibility that the beams were strong enough to carry the tower if constructed of proper workmanship and material.

By Mr. Stewart Anderson (for Messrs. Sage): It would obviously have been better to have had a clerk of works.

Mr. Moritz Kahn, C.E., Managing Director of the Trussed Concrete Steel Company, Ltd., and inventor of the "Kahn" system, was the principal witness, and was under examination for several hours. He explained the operation of the strains and stresses on ferro-concrete work by a series of demonstrations on a blackboard and by means of models. He gave details of the design of the construction of the beams, and said they were originally asked to design for a tower weighing between 25 and 30 tons. This was afterwards altered to a weight of between 35 and 40 tons. They altered their plans, but accepted no responsibility, for a tower which weighed more than 40 tons, nor did they assume responsibility for the brick tower *per se*, and the details were never submitted to them.

Witness explained the details of the foundation beams for the tower, and showed by diagrams the stress to which they were to be submitted. He said that, as a matter of fact, the beams on which the tower rested would have required 155 tons dead weight to bring the beams down, whereas the tower only weighed about 38 tons. He had carefully examined the *débris* and found no evidence of failure by tension, compression, or shear. He concluded that the collapse was due to the shock of some load suddenly applied to a back beam. Whatever was the cause, it was something beyond the control of his firm. If the dome weighing 2 tons fell on to this beam it would give a shock equal to a dead load of 480 tons, "which would go through the beam like cheese."

Examined by the Coroner as to the allegation of the witness Porteous, the previous day, that a piece of wood was made up in the beam R22, witness said he had examined the beam, and there was no trace of it. Even if it had been left in it would not have been the cause of failure. Had that wood block anything to do with the tower coming down?—No. Witness also added that the two steel joists, which were used in place of the beam for the back, which had been misplaced, had nothing whatever to do with the cause of the accident.

Cross-examined by Mr. Kay (for the architect), witness said he believed the cause of the tower collapsing was the weakness of the walls, caused by the small brick arch round the clock dial, which was not properly bonded. It was a physical impossibility to bond the terra-cotta rings to the brickwork. The vertical joints in the terra-cotta were another cause of weakness. He believed, also, the cast-iron ring inside the dial would be a contributory cause to the weight of the tower. Witness added that in his view the tower was merely being held up by the strength of frozen lime mortar, and, owing to its design, was in a state of unequilibrium, which only required the slightest disturbance to bring it over. Dealing in detail with some parts of the design of the tower, he said he found at one corner stresses which were absolutely prohibitory in engineering designs.

By Mr. Black (for Messrs. Boyes): He usually designed buildings with a safety factor of 4, and the beams under the tower were designed to this factor. They were designed to carry 40 tons, and, therefore, their factor of safety would be 160 tons, and as a matter of fact he found that the breaking weight was about 155 tons.

By Mr. Camidge: He had built at least six hundred buildings and other works on his system in the last six years.

The Foreman: We think it would have been better for the firm to have had an experienced clerk of works.—That is beyond our control. It was a matter for the architect.

In answer to a juror, Mr. Kahn said his formula for the concrete was 4 gravel, 2 sand, 1 cement. He did not know some ferro-concrete firms used a proportion of only 1 of sand, but 4—2—1 was the standard formula of the Royal Institute of British Architects.

Mr. Frederick Rings, architect, surveyor, and civil engineer, London, was asked by the Coroner if he attributed the fall of the tower to superstructure under it, to the tower itself, or to the concrete construction. Witness said he thought the fall was caused by the failure of the two beams R24, which acted as cross-beams from the main beams at the front and back. This was due to the faulty design of the reinforced concrete.

In cross-examination by Mr. Kahn, Mr. Rings admitted that he had made a mistake in his calculations as to the shearing stress, and in cross-examination by the Factory Inspector he said he acknowledged now that the beams were four times stronger than he anticipated in his first calculations, but he was still of opinion that the tower fell because the cross-beam R24 came away from the main beams on account of tension in the upper area of the cross-beam.

Mr. Geo. Fredk. Bowman, architect, Leeds, who had made an inspection of the building at the request of the Coroner, said in his opinion the material used in the concrete beams was sound and good, and complied with the formulæ of the Royal Institute of British Architects. In his view, if the tower had been carried out to the details in the bonding of the angles and to the specifications, which stated that the whole of the terra-cotta work should be filled with cement concrete and walled and jointed with cement mortar, it would have stood. The weakest part about the tower was the straight joints up the side of the pilasters. One of the weak points was the clock rim, which was not tied to the two half-brick rim arch at the back.

In reply to Mr. Newbald Kay (for the architect, Mr. Monkman), witness said Mr. Kahn's theories as to the cause of the accident given to him before his inspection had no weight with him in coming to his conclusions. There was no material difference between them. There was no evidence of the beams having failed, either by compression or tension. There was no sign of a stump or of shearing where the beams joined, but there was the fact that the concrete was good, and that the calculations showed that at those points it was very strong indeed. The beams running from front to back were fixed, but they took a dead weight, and were quite capable of carrying all that was upon them.

Mr. Alan Ruddle, architect, Peterborough, called by Mr. Camidge for Mr. Kahn, said he had examined the drawings and plans of the tower, and also the plan for the terra-cotta work. It was his fixed belief that the tower would not have stood for long. The whole of weight of the superstructure must have b thrown on to the terra-cotta, which was p tically unsupported by anything, and w tend to burst open.

The Coroner, in summing up, dealt with various theories propounded to account for disaster. He said the theory that the fe concrete work was defective in design and g way was dependent on the proof that the p under the beams had been removed. evidence of the contractors was that no p had been removed, and he thought prob the jury would come to the conclusion that props had been confused with the remova the side casings. As to the other theory the tower fell first, he said it appeared to h been built rather quickly in wet weather with lime mortar, and according to the evid the mortar was not thoroughly set when collapse took place. Most of the witne were agreed that it would have been bett built in cement. It also appeared that th was something not quite right about the ce of gravity. It was for the jury to say whe the variations in the terra-cotta work and adhering to the specifications gravely weake the structure, or was a cause contributing t collapse, or whether it was due to being built lime mortar in wet weather, or the effect frost, or to being too quickly built, or whe it was due to all or any of these things, o some other cause. It was for the jury to what caused the tower and the under-struct to fall, and who, if anyone, was crimin responsible for that falling.

The jury were absent for an hour and a and on returning the foreman stated that found that "Bowman died from shock as result of injuries caused by the fall of tower, but the evidence is so conflicting, chiefly theoretical, that we are not able to what caused the tower to fall." They added a rider that "in our opinion it would been better for all parties concerned ha fully qualified clerk of works been engaged."

[The above is abstracted from a full re which appeared in the *Yorkshire Post*.]

ENGINEERING NOTES.

The Institution of Civil Engineers.

THE following is an abst of a paper by Mr. F. ford, B.Sc., entitled " Features of the West Afr Government Railways," at the ordinary meeting of the Institutio Tuesday. A brief history of railway cons tion in the West African Colonies of S Leone, Gold Coast, Southern Nigeria Northern Nigeria is first given, and its e upon the pacification of these countries upon their revenues is described. The meth of surveying are then dealt with in detail the difficulties met with in the clearing of fe are referred to, some description being g of the more important trees found and uses. The method of constructing earthw is dealt with, and the forms of pipes and culv found most suitable for these tropical rail are referred to. Particulars of about of the more important bridges are given tabular form, with general remarks upon methods of erection employed; and the and Denton Bridges at Lagos, aggrega 3,000 ft. in length, are described in some d The types of structures adopted for tem and wayside stations, workshops, engine-s coal-stores, carriage-sheds, wagon-repair s stores, bungalows, quarters, water-tanks, are mentioned, and the permanent way system of signalling are described. The concludes with particulars of the cos construction and the results of working i case of each colony. A brief reference i made to the railway work carried out by in her West African Colonies.

The Liverpool-street Tunnel.

THE engineers engaged tunnelling for the exten of the Central London Rail from the Bank to Liver street have completed the boring. The p working from opposite directions—from present terminus and from Liverpool-str have effected a junction. The engin calculations were so accurate that the through which the working parties were to speak was only 30 in. in diameter. expected that the extension, which is about a mile in length, will be ready for traffic in or July next.

THE BUILDING TRADE.

THE ITUTE OF BUILDERS: V TO CHEAPEN TRANSPORT.

following is the continuation of our stract of the paper by Mr. A. W. Gattie ently read before the Institute of ilders and the London Master Builders' on: –

king of the building trade, I imagine cost of transport must be quite 33 of the value of building materials ; it is so of the most expensive forms and it is 100 per cent. of the cost of per bricks, when carried from Peter-

If we can get our building material heaper, the immediate result would be could build houses more cheaply. ntly there would be a larger demand es, and, while economic methods of would undoubtedly save labour and ployment per ton, they would increase age and also would provide labour in ections. I know of no trade in which activity would boom the labour market n activity in the building trade.

s I may here give two examples of of material, the first of which I have ie uneconomic and the second the . Let us suppose that it is necessary 100,000 glazed bricks from Yorkshire n, a distance of 200 miles. The weight :–

of such bricks would weigh	301 tons
ck would carry under nor- nospheric conditions about water, or a total of 44 tons	
er	44 ,,
load to be carried would erefore	345 ,,
rney is now performed in pen trucks, each weighing weather about 6·6 tons e, which gives a total tare including the brake van, of	345 ,,
weight behind the engine equently	690 ,,
these trucks would be ed to Yorkshire empty, ng the haulage of	345 ,,
s hauled would be therefore	1,035 ,,

tons hauled 200 miles = 207,000 ton presenting 207,000 ton miles work done. me occupied in the journeys would be 4 hours or more, at about 3 miles an rage.

ne occupied in loading and unloading, s or more.

tal time occupied from start to finish nsequently be 336 hours or fourteen

pital value of fifty trucks at 70*l.* apiece 3,500*l.*, and the occupation of railway olved would be about 10,000 sq. ft. for days.

tal charge for railway haulage in rail- panies' own trucks is 11s. 8d. per ton for 200 miles.

345 tons of bricks at 11s. 8d. per ton = 48,300d. = 201*l.* 5s. 2d.

But, as we have seen, the haulage of the bricks is really only a part of the job; the bricks have been hauled 200 miles and the trucks have been hauled 400 miles. Therefore the actual work done for this money is 207,000 ton miles.

This charge gives the railway companies a gross earning of 0·23d. per ton mile, under a farthing, and that figure demonstrates the enormous value of the locomotive, which only absorbs a little over a quarter of this sum, or say 0·05d. per ton mile.

We now have to add to this cost of railway haulage the cost of handling and road haulage or carting. The net labour cost of packing 1,000 glazed bricks in straw, taken from the adjacent stack and put into the truck, would be 2s. 3d., exclusive of establishment charges. Quoting the labour at 6d. per hour, we therefore have a loading cost, into the railway trucks at the brick factory in Yorkshire of £11 5 0

The next handling is at the depôt in London, and consists of unloading from the truck to the stack, at the same rate, viz.:	11	5	0
Subsequently we have a third handling from the stack to the road cart, which with the carman's help, not here charged for, would amount to	5	7	6
The bricks now have to be carted to the job.			
The minimum charge for this cartage per thousand bricks is 4s. 6d. for a distance not exceeding 2 miles, and this sum includes waiting on arrival at the job, sometimes for hours, and helping the brick-makers' labourer to load the cart and the contractors' labourer at the job to unload the cart, 4s. 6d. per 1,000 on 100,000 bricks .. –	22	10	0
The labour in assisting the carman to unload and stack the bricks at the job at 2s. 3d. per 1,000 on 100,000 bricks .. .. =	5	7	6
Total cost of cartage and handling –	55	15	0
Which, added to cost of rail haulage	201	5	2
Gives us a grand total of	£257	0	2

The cost of these bricks, delivered in London would be 1,000*l.*, out of which the brick-makers would pay 251*l.* 2s. 8d. for transport, and the contractor would pay 5*l.* 7s. 6d. for unloading. This total of 257*l.* 0s. 2d. would amount to over 33 per cent. of the sale value of the bricks as stacked in Yorkshire.

We will now consider whether this work could be done more cheaply and without injury to any of the parties concerned.

Let us take the same load sent for the same distance, but on this occasion let it be sent in seven big truck loads, each carrying thirty skips, or 210 skips in all, there being an average of 476 bricks in a skip. The total load of these bricks would be, as before, 345 tons, including 44 tons of water, not easy to eliminate 345 tons

Add to this the weight of 210 skips at 1 cwt. apiece, say	11 ,,
Seven bogie trucks, weighing 25 tons each, and each measuring 50 ft. over all	175 ,,
The total weight behind the engine would be	531 ,,

instead of 691 tons estimated in the former example.

It must not, however, be forgotten that these skips would have to be returned to Yorkshire, and, in order to make this return journey as economic as possible, the skips are so constructed that they can be taken to pieces and packed together Chinese-puzzle fashion, so that a bundle of eight skips will occupy a cube of 41 in. These skips could easily be packed into one truck and not fill it. The full capacity of a truck having a platform of 48 ft. by 8 ft. would allow of 240 skips being placed upon it. However, we are only considering 210 skips as being the necessary work involved in the delivery of these particular 100,000 bricks, and the return journey therefore amounts to—

	11 tons of skips
and one truck weighing	25 tons
or	36 tons in all.

With regard to the remaining six bogie trucks, these would not be returned empty from the Clearing House unless at that time the Clearing House had no goods to send to Yorkshire, an extremely improbable contingency, as the Clearing House would represent the whole of the seventy-four existing goods stations of London, and would consequently have, on an average, seventy-four times as much to send away as any individual goods station. However, we will allow, for the sake of argument, that one of these six waggons had to be returned unloaded, and we then have to add 25 tons tare, to be carried unremuneratively to Yorkshire. We must therefore assume that the total tons hauled in performing this brick business would be 592 tons, which, carried for 200 miles, would amount to 118,400 ton miles. The time occupied by the journeys would be reduced on account of the reduced load behind the engine, and also because the bogie trucks would be fitted with continuous brakes which would admit of the train pulling up within a reasonable distance. The length of the train would be decreased to 350 ft., as from the length of a train of fifty trucks of 18 ft. each, or 900 ft. in all.

Fifty 18-ft. trucks would measure 900 ft., and seven 50-foot trucks would measure 350 ft. Putting the time of the journey of such at 20 hours, *i.e.*, 10 miles per hour, including stopping, the actual running time being at 20 miles an hour, we have:—

Seven trucks at 20 hours and one truck returned at 20 hours, or eight trucks occupied for 20 hours loading and unloading, say 4 hours' detention, altogether (3¼ hours at the brick-field and half-hour at Clearing House), we have one day's use of eight trucks, capital value 500*l.* each .. .. =	£4,000	0	0
And, say, one month's detention of 210 skips, capital value 2*l.* each =	420	0	0
Occupation of railway space would be about 4,000 sq. ft. for one day.			
The total charge at current rates is, we know, 11s. 8d. per ton, which gives us	201	5	2
On 345 tons load, involving 207.000 ton miles work done, at 0·23 per ton mile.			
Allow the railway company the same rate per ton mile, the charge on 118,400 ton miles would be	113	9	4

In this manner it will be seen that on the item of railway haulage a saving of 87*l.* 15s. 10d. will be made out of an expenditure of 201*l.* 5s. 2d.

We will now leave the consideration of railway haulage and turn to the handling, storage, and cartage of these bricks on Clearing House principles. The original cost of packing the bricks in skips at the brick factory in Yorkshire would amount to the same as packing in trucks.

This operation would cost	£11	5	0
The cost of hoisting these 210 skips by crane, four at a time, into the railway waggons, would amount to about 2s. 6d., and perhaps occupy half an hour.			
Unloading these 210 skips by cranes at the Clearing House might occupy some ten minutes, and the cost per skip for either hoisting from the truck and lowering into the crypt for storage, or hoisting on to the road level and depositing on a road-car for direct delivery, may be put at 3d. per skip, inclusive Clearing House charge, or 6d. per skip including unloading the railway waggon, loading motor-car and storage ..	5	5	0
Total	16	10	0

Cartage by motor-car at 2s. 6d. per load of 1,000 bricks, for a distance not exceeding 2 miles, and including unloading at the job without assistance, by means of a special apparatus carried by the car	£12	10	0
Total loading, unloading, and cartage, and delivery at the job ..	29	0	0
which, added to cost of rail haulage	113	9	4
Gives a total cost of bringing bricks from Yorkshire to London within 2 miles of the Clearing House of	142	9	4

instead of 257*l.* 0s. 2d., showing an economy of 114*l.* 10s. 10d., or a saving of about 45 per cent.

This, however, would only allow of delivery on a job within 2 miles from the Clearing House, and all jobs would not be within 2 miles of the Clearing House. I have been asked many times whether it would not be cheaper to have the bricks sent to the nearest station to the job than have them sent from the Clearing House. If it can be shown that it would be cheaper to send a consignment of bricks to any particular station in London, that could be very easily arranged at the Clearing House, as, for instance, we will assume that half a truck-load, that is, fifteen skips of bricks, need to be sent to Croydon, the skips would be put on to the first goods train leaving the Clearing House for Croydon, and on arrival at Croydon they could be very easily lifted off the train and deposited on any convenient spot without any delay, with the minimum of loading and unloading expense, and a suitable charge for haulage; but for any distance within 10 miles of the Clearing House it would be cheaper to carry the bricks by road direct, in Clearing House motor vehicles, carrying 1,000 bricks in two skips per load.

The class of brick I have been considering is the most expensive kind, and is, of course, not so much used as the common Fletton brick. When fairly dry, the Fletton brick weighs 5 lb. 4 oz., and easily absorbs 1 lb. of water, bringing its weight up to 6 lb. 4 oz. The cost of carrying 100,000 bricks from Peterborough, a distance of 76 miles, at 4s. per ton, would amount to 50*l.* By present methods this operation involves an engine haulage of 44,080 ton miles at a little over a farthing per ton mile. On Clearing House principles, the work done would amount to 34,884 ton miles, which, at the same rate, would be 39*l.* 4s. 10d., and you will thus see that, instead of making a 45 per cent. economy in this instance, we can only make an economy of 20 per cent., amounting to 10*l.* 15s. 2d. However, it must be remembered that the gross saving on Fletton bricks on a year's deliveries would be far larger than that of the happy gentleman who ships glazed bricks from Yorkshire. Fletton bricks are not handled with that delicacy and care which is bestowed upon glazed bricks, but the handling of them costs a considerable sum of money which I venture to put at 5s. per 1,000, which on 100,000 bricks would consequently be 25*l.*, and here again the Clearing House could effect an economy of 50 per cent. The total cost of carrying 100,000 Flettons from Peterborough to a job within 2 miles of the goods station to which they were taken would be 75*l.* By Clearing House methods, the work could be done for 52*l.*, making only an economy of 30 per cent. on the entire job. I think that these two examples are a very fair criterion of what could be achieved by Clearing House methods in the matter of building material.

If we compare the equipment of the Clearing House with its immense array of powerful apparatus with a goods station, such as Paddington or Bricklayers' Arms, we at once realise that the handling of steelwork or heavy timber could be carried out with modern apparatus, far more cheaply than with prehistoric. However, there is a point to which I should like to draw your attention. Modern apparatus costs money, and in order to use it to the very best advantage it must be kept busy, and the installation of the Clearing House would not be kept busy if it were reduplicated all over London. It would cost seventy-four times as much, if it were placed in all the goods stations, and it would be unremunerative, and it could not possibly discharge its function as a depôt of universal exchange. A dozen little Clearing Houses dotted about London could not possibly do the work of one big Clearing House. The great virtue of the Clearing House is that it is a system of unification. All vehicles inwards or outwards proceed on radiant routes. All vehicles starting from it carry goods from everywhere to everywhere and pass everywhere on the road, and all vehicles, either road or rail, going to the Clearing House bring goods from everywhere to everywhere and pass everywhere on the road.

Before leaving the subject of the handling of building material at the Clearing House, I would like to draw your attention to the fact that all transactions are carried on under cover, hence if a load of limestone is delivered at the Clearing House the transhipment of this would not need to be done in the wet, although a thunderstorm might be in full swing outside the Clearing House. The limestone would arrive in Clearing House skips and would be dealt with in similar manner to the bricks. I think most builders' foremen know very well that they may send for a truck-load of lime, and directly it is uncovered have to cover it again because it begins to rain. Sometimes this leads to considerable loss of time and money, and there are other circumstances when it is undesirable to unload goods in wet weather. This drawback would never happen in the Clearing House."

The lecturer then dealt with the handling of miscellaneous goods of all kinds.

SEVENTH MANCHESTER BUILDING TRADES EXHIBITION.

MR. CAWOOD presided at the Midland Hotel, Manchester, on the 15th inst., at a meeting of the exhibitors of the Seventh Manchester Building Trades Exhibition, which will be held at the City Exhibition Hall from March 5-16. The minutes of the last meeting were read, and it was pointed out that the dates of the exhibition, the band engaged, and other arrangements had been carried out as duly authorised by the exhibitors at the 1910 exhibition.

It was announced that Councillor S. W. Royse, J.P., Lord Mayor of Manchester, had consented to open the exhibition at twelve noon on March 5, and that Alderman J. R. Wilson, J.P., Chairman of the Manchester Improvements Committee and Town Planning Committee, had consented to take the chair upon that occasion. Resolutions dealing with the Reception Committee and the names of gentlemen to propose and second various votes of thanks were duly carried. It was announced that telephones at the special rate of 1*l.* (one pound) each could be affixed to the various exhibitors' stands, thus permitting the exhibitor to telephone from his own stand at the City Hall to his works. Another communication was as to the printed list showing the special railway facilities from towns within the radius of 100 miles of Manchester to the exhibition.

A number of other resolutions were passed, and suggestions were made of interest to exhibitors not only at this but at other building trades exhibitions far removed from Manchester.

It was generally agreed that the exhibitor had a right to have a voice in the management of exhibitions that he supported with time and money, and the Chairman was thanked for the manner in which he had given exhibitors the opportunity of taking part in the direction of exhibitions under his control.

The Chairman announced that more exhibitors had booked space this year than any previous exhibition, and that there was every prospect of a Seventh Manchester Building Trades Exhibition being a successful exhibition. Over seventy firms are now included in the list of exhibitors. An exhibitor drew the meeting's attention to the fact that local architects, surveyors, and builders were in sympathy with the City Hall Exhibition, which had been recognised for years as the building trades exhibition for the North of England.

STANDARD TIME RATES OF WAGES.

A REPORT has been issued on Standard Time Rates of Wages and Hours of Labour in the United Kingdom at January 1, 1912 [Cd. 6054], by the Labour Department. The information has been collated from statements issued by employers' and workmen's associations or collected by the Department from the officials of the associations. It is pointed out that the rates given in the report are not necessarily the rates actually predominant in each trade and district covered, several factors being necessary for consideration to determine these. In the building trades there are over 800 local agreements in operation regulating wages and hours and other conditions of labour. The statistics, generally, show that longer h are worked where the lowest rates are pa

In the building trades in the London di the wage paid to bricklayers, masons, penters, and joiners was 10½d. per plumbers and plasterers 11d., painters and 9d., and bricklayers', masons', plasterers' labourers, 7d. Amongst the tricts where the lowest rates are pai these trades are Driffield, Boston, Ledb Market Drayton, Stratford-on-Avon, Dereham, and Lynn. In these the rat bricklayers is 7d. per hour, with the exce of East Dereham, where it is 6d. The for the other branches of the building t in these towns are not fully stated, but small variations where given. In the engi ing trades the rates were fairly constant general areas, though slightly lower rates usually to be found in the less impo centres.

BUILDERS' CLERKS' BENEVOLENT INSTITUTIO

WE understand that the President, Dudley Bartlett, of Messrs. Perry & Co. Ltd., is actively engaged in organisi theatrical performance at the Royal Theatre, Sloane-square, on Saturday, Ma in aid of the funds of this Institution. piece to be presented is Mr. George Be Shaw's "You Never Can Tell," and, as i be interpreted by members of "The Str Players" Dramatic Society, an exc evening's entertainment is assured. We s like particularly to draw the attention readers to this undertaking, as we feel strongly that the Institution deserve hearty support of all connected with building trade in London. We all know difficult it is to get people to interest selves in charitable work of this sort because they are not in sympathy wit work, or do not want to put their han their pockets, but rather because there certain amount of personal trouble en in writing for tickets. Mr. Dudley B assures us that, with the very loyal energetic support of the Committee Institution, he is confident that this dif can and will be overcome, and he will fully acknowledge any applications for Tickets may be obtained from hi Tredegar Works, Bow, E.

GENERAL BUILDING NEW

BOTANICAL INSTITUTE.

Sir Aston Webb, R.A., is the archite the Botanical Institute in Prince Consor The building will form part of the In College of Science and Technology. A r able feature will be the greenhouse-labo on the top floor, which Sir Aston We evolved in consultation with the author

GLASGOW BUILDING SCHEME.

The Glasgow City Improvements Com have approved the adoption of plans pr by the City Engineer, Mr. A. B. M'T for the reconstruction of the Trongat which was recently destroyed by fire. north side between Tontine-lane and street it is proposed to construct two bl buildings, of which the front one will floor area of 22,000 sq. ft., with shop and basement facing the Trongate, a upper stories. The back block betwee tine-lane and several courts will have area of 21,000 sq. ft. on the ground flo four upper stories. The buildings are built as warehouses, and are so desig either to serve one occupant or to be d into flats. They are to be fireproof throu and are to be provided with lifts for pas and goods. The estimated cost of th buildings is 25,150*l.*

NEW BUILDINGS ON THE EMBANKMEN

Alterations are about to be carried the Charing-cross and Temple Stations District Railway on the Victoria-embar At Charing-cross the booking-hall a entrances to the station are to be structed, and above the booking-offic be erected a large building of stone a brick, which will have 140 rooms, and used either as an hotel or as offices. Temple Station there are to be changes. The booking-office is to be and enlarged, and a new entrance p from the Embankment. Adjoining th ing-office and with entrances from the and from the bottom of the steps lea Norfolk-street will be a restaurant with space of 5,000 sq. ft. It is also suggest the flat roof, extending over the whole new building, should be used as an

garden This would have an area of sq. ft., with a frontage to the Embank- of 260 ft. Mr. H. W. Ford is the archi- or the work.

TRADE NEWS.

notice has been called to Pollock's t reinforced wood-blocks for paving and ng (also adaptable to other purposes). blocks are built into sections of any nient size at the mill or factory. It is ed that the adoption of this method will e the time occupied in handling the ial and the ultimate placing of the work minimum, the work being accurately red in advance from drawings. The ns may be straight-edged and grooved ngueing, and can be so constructed as to fely laid on the bare joisting like an ary floor-board, abolishing the necessity bed, and when used for road-paving (on ated bottom) the usual grouting process be dispensed with. Further information be obtained from Mr. Pollock, 151, ver-buildings, Fair-street, Tooley-street, on, S.E.

Yale No. 45 cylinder deadlocking night embodies a new method of combining the nience of a spring bolt with the security lead bolt. The bolt is square-ended, and, projected, cannot be pushed back by end ure. When held in the retracted position e stop its end is flush with the front e lock and fills the bolt hole completely. the door closes the two pivoted hooks strike are forced apart by the bolt, and automatically close over it, thus securely g the door. The hooks are so guarded make it impossible for them to be ked through the door stile or otherwise ction of this lock in closing is smooth and thus making it suitable for use on doors ped with door checks.

der the direction of Mr. W. Inglis, archi- Glasgow, Boyle's latest patent "air- " ventilators have been applied to Coat- Church, Coatdyke, Scotland.

Infectious Diseases Hospital, West wich, is being supplied with Shorland's -air ventilating patent Manchester grates essrs. E. H. Shorland & Brother, Ltd., of worth, Manchester.

LICATIONS UNDER LONDON ILDING ACTS, 1894 to 1909.

Tuesday's meeting of the London County il the following applications under the n Building Acts were dealt with. (The of the applicants are given in paren-):—

ines of Frontage and Projections.

tford.—Addition at the rear of No. 195, -street, Deptford, to abut upon the rn side of Hanlon-street (Mr. L. Jacob). sent.

sington, North.—Retention of a green- at the rear of No. 33, Wallingford- , Kensington (Mr. B. Hamburger). — nt.

sington, South.†—Covered way in front 37, Victoria-road, Kensington (Mr. D. for Mr. A. le Rossignol and Miss E. le nol).—Refused.

isham.—Five houses with porches and boards on the eastern side of Siddons- Forest-hill (Mr. E. C. Christmas).—Con-

lington, South.—Retention of a con- ory over the porch at the entrance to 4, Marlborough-gate, Bayswater-road I. J. Edgar).—Consent.

lington, South.—Projecting illuminated n front of No. 2, Woodfield-crescent, w-road, Paddington (Mr. J. Lawrance . C. Mickleburgh).—Consent.

lington, South.—Wood and glass screens sides of the entrance porch at No. 70, ess-terrace, Bayswater (Messrs. J. Vears . —Consent.

dsworth.—Buildings on the southern side lrose-road, Southfields (Messrs. A. W. & Co.).—Consent.

minster.—Shelter at the entrance to No. tillery row, Westminster (Mr. W. V. er for the Army and Navy Co-operative , Ltd.).—Refused.

Width of Way.

ea.—Building upon a site abutting avilion-road, Charlotte-street, and Cross- Chelsea (Mr. C. W. Stephens for le' Stores, Ltd.).—Consent.

of London. Building across the eastern Cockerill's-buildings (Mr. W. Pam- .—Consent.

erhithe.—Buildings on the southern side therhithe-street, Bermondsey (Mr. F. d for the South Metropolitan Gas Com- —Consent.

Width of Way and Lines of Frontage.

Camberwell, North.—Building upon the site of No. 419, Old Kent-road, Camberwell (Mr. W. F. Young for Mr. P. F. R. Saillard) — Consent.

Islington, South.—Building at the rear of No. 503, Liverpool-road, Islington (Mr. H. Kenchington for Messrs. Headland & Son).—Consent.

Paddington, North.—Projecting teak sill in front of No. 4a, Charles-mews, Paddington (Mr. W. R. Phillips for Messrs. C. Rickards).—Consent.

Woolwich.—Two story oriel window in front of No. 56, Beresford-street, Woolwich (Mr. R. J. Bolton).—Refused.

Line of Frontage, Space at Rear, and Projections.

Kensington, North.—House on the southern side of St. Quintin-avenue, Kensington, and the eastern side of Wallingford-avenue (Messrs. E. T. Daley & Son).—Consent.

Lines of Frontage and Construction.

Greenwich.—Addition to a coachhouse at the rear of No. 56, Shooters-hill-road (Messrs. Dyer, Son, & Hilton).—Consent.

Hampstead.—Temporary wood and iron building at No. 1a, Linstead-street, Hampstead (Mr. E. W. Steward).—Consent.

Holborn.—Iron and glass shelter at the entrance to the Chancery-lane tube railway-station, High Holborn (Mr. E. P. Grove for the Central London Railway Company).—Consent.

St. George, Hanover-square.—Temporary wood and iron building at the premises of the Motor Spirit Direct Supply Company, Ltd.—Consent.

Deviation from Certified Plans.

Peckham.—Rebuilding of No. 86, Rye-lane, Peckham (Mr. F. Nicholls for Messrs. Upson & Co.).—Consent.

St. George, Hanover-square.—Re-erection of No. 34, Three Kings yard, Grosvenor-street, Westminster (Mr. F. W. Foster).—Consent.

Alteration of Buildings.

Westminster.—Additional story at No. 32, Old Queen-street, Westminster (Mr. P. H. Feilding for the Right Hon. Lord Lucas).—Consent.

Uniting of Buildings.

City of London.—Openings in a division wall and use of doors of special construction in lieu of iron doors on one side of such openings at Nos. 171, 172, and 173, Aldersgate-street, City (Mr. T. B. Whinney).—Consent.

Finsbury, Central.—Uniting of Nos. 80 and 82, Clerkenwell-road, Finsbury (Mr. F. Eilsart for Messrs. Butler & Crispe).—Consent.

Holborn.—Openings in the party walls at Nos. 100, 101, and 102, Hatton-garden, and Nos. 13, 14, and 15, Robin Hood-yard, Holborn (Mr. J. Sawyer for Mr. A. W. Gamage).—Refused.

Kensington, North.—Opening between Nos. 5 and 9, Colville-mansions, Talbot-road, Bayswater, at the first-floor level (Mr. J. M. Beveridge for the Hon. E. G. Strutt).—Consent.

Strand.—Uniting of Nos. 57 and 59, Regent-street, by openings at the second, third, and fourth floor levels (Messrs. Emden, Egan, & Co., for Messrs. Swan & Edgar, Ltd.). - Consent.

The recommendation marked † is contrary to the views of the Metropolitan Borough Council concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ASHFORD.—Technical institute, Elwick-road; Mr. F. W. Crook, Secretary, Education Committee, Kent County Council, Caxton House, Westminster, S.W.

Auchterless (Aberdeenshire).—Additions to school (1,800*l.*); Mr. W. L. Duncan, architect, Hall Hill House, Turiff, Aberdeenshire.

Audley (Stoke-on Trent).—Schools (2,000*l.*); Messrs. Watkin & Adams, The Square, Burslem.

Banbury.—Tar distillery works, near Great Western Railway-station, for Messrs. Robinson Brothers. Additions to factory for Messrs. H. Stone & Sons, Ltd.

Banchory.—Additions to school; Messrs. Wilson & Walker, architects, 181A, Union-street, Aberdeen.

Barrow-in-Furness.—Six houses, etc., Bridge-gate Estate (2,150*l.*); Mr. A. Race, Surveyor, Town Hall, Barrow.

Bedlington.—School (4,500*l.*); Mr. Tart Sen ton, builder, Delaval

Benfieldside. — Hospital, Ritson's - road (10,000*l.*); Mr. J. J. Eltringham, architect, Blackhill.

Beverley.—Baths, Lord Roberts'-road; Mr. J. G. Smith, Surveyor, Town Hall, Beverley.

Blackpool. — Workshop, etc., Hull-street (2,700*l.*), for the Fylde Water Board.

Blyth.—Offices for Harbour Commissioners (6,000*l.*); Messrs. Cackitt & Burns Dick, architects, Grey-street, Newcastle.

Bolton.—Picture theatre (2,100*l.*); Mr. H. Booth, 42, Regent-street, Haslingden.

Bournemouth.—Vicarage (2,000*l.*); Mr. H. E. Hawker, architect, St. Peter's-chambers, Bournemouth. Alterations to Palmerston Hotel for Messrs. Whitbread & Co., Ltd.

Brechin.—Proposed baths (6,000*l.*); Mr. W. Eggie, Surveyor, Burgh Offices, Brechin.

Brinscall. –Weaving-shed (19,000*l.*); Messrs. Duxbury & Ward, architects, Blackburn.

Buxton (Derbyshire). –Extensions to pump-room; Mr. W. H. Grieves, Surveyor, Urban District Council Offices, Buxton.

Cardiff.—Buildings on site of old Town Hall (75,000*l.*) for the Co-operative Wholesale Society.

Carnarvon.—Infirmary (6,850*l.*); Mr. R. Jones, builder, Llanwndd.

Colebrook.—Vicarage; Messrs. E. H. Harbottle & Son, architects, County-chambers, Exeter.

Desborough (Northants). — Congregational church (3,500*l.*); Messrs. Sharman & Archer, architects, 3, Market-street, Wellingborough; Messrs. Hacksley Brothers, builders, 1, Regent-street, Wellingborough.

Dunfermline.—Offices, opposite Carnegie Library (7,500*l.*); Surveyor, Town Hall, Dunfermline Parish Council. Branch premises, New-row (7,000*l.*), for the Bank of Scotland.

Edinburgh.—Additions and alterations to Victoria Hospital for Consumption (2,000*l.*); Messrs. Sydney Mitchell & Wilson, architects, 13, Young-street, Edinburgh. Printing works, St. James's-square (10,000*l.*); Mr. C. H. Greig, architect, 6, York-place, Edinburgh. Mission hall for Nelson Bequest Trustees, Spittalfield-crescent (2,150*l.*); Messrs. Cousin, Ormiston, & Taylor, architects, 140, Princes-street, Edinburgh.

Exeter.—The estimate of Messrs. C. H. Hunt & Son, builders and contractors, High Wycombe, has been accepted for rebuilding of Exeter Station, Great Western Railway. Warehouse, High-street; Messrs. J. M. & A. J. Pinn, architects, Bedford-circus, Exeter.

Exmouth.—Café, bakeries, etc.; Mr. T. Abell, architect, Rolle-street, Exmouth: Messrs. T. Abell & Son, builders, Rolle-street, Exmouth.

Gateshead.—Lecture hall and Sunday-school (2,000*l.*); Mr. J. W. Taylor, architect, St. John-street, Newcastle.

Gloucester.—St. Catherine's Church (8,000*l.*) · Mr. W. B. Wood, architect, Queen-street, Gloucester; Messrs. W. Byard & Son, builders, Queen-street, Gloucester. Extensions to Moreland's Match Factory (3,000*l.*); Mr. E. A. Pryer, 18, Clarence street, Gloucester.

Grassington. — Weaving-shed: Mr. James Hartley, architect, Swadford-chambers, Skipton.

Greenock.—Picture theatre (1,800*l.*); Mr. C. A. Boswell, architect, 53, Bothwell-street, Glasgow.

Harwich. — Fire-station, Wellington-street: Mr. H. Ditcham, Surveyor, Harwich Town Council.

Haslingden.—Additions to Messrs. Tattersall's Mill, Grave-road (2,134*l.*); Mr. W. Tattersall, architect, Market-place, Haslingden.

Hawick.—Swimming-baths (3,000*l.*); Mr. A. Inglis, architect, 12, North Bridge street, Hawick.

Highgate, N.B.—Lodging-house (2,200*l.*); Messrs. John Melvin & Son, architects, 64, Mar-street, Alloa.

Keighley.—Extensions to baths (5,000*l.*); Messrs. J. B. Bailey & Sons, architects, Scott-street, Keighley.

Larne.—Extensions to fever hospital (550*l.*); Mr. A. M'Neill, builder, Larne.

Lochgarron.—Additions to parish church, also manse and offices (1,850*l.*); Messrs. A. Ross & Son, Queensgate, Inverness

Lochness. –Church (3,000*l.*): Messrs. George Gordon & Co, architects, 6, Queensgate-street, Inverness.

Montrose.—Slaughter-house (2,500*l.*); Mr. S. L. Christie, Surveyor, Town Hall, Montrose.

Otley. Underground conveniences, Market-place; Mr. C. F. Hodgson, Surveyor, Urban District Council Offices, Otley.

Paxton.—Manse buildings (2,000*l.*); Messrs. J. Stevenson & Son, architects, 14, North-terrace, Berwick-on-Tweed.

Peasedown St. John (near Bath).—School; Mr. W. F. Bird, architect, Midsomer Norton.

THE ROYAL ACADEMY LECTURES:

ITALIAN DRAUGHTSMEN OF XVIITH AND XVIIITH CENTURIES, AND PIRANESI.

THE fourth and concluding lecture of the present series of Royal Academy lectures on "Architectural Draughtsmanship" was delivered by Professor Reginald Blomfield, A.R.A., on the 15th inst., the subject being "Some Italian Draughtsmen of the XVIIth and XVIIIth Centuries, and Piranesi."

Professor Blomfield said that one man dominated architectural draughtsmanship in the XVIIIth century—*i.e.*, Giovanni Battista Piranesi, who stood apart from his predecessors and contemporaries. But however transcendant his achievements, whatever degree of perfection such a man may ultimately reach, careful study would always show that he is the child of his age, and that his genius is shown not least in the advance that he makes along a path already trodden by his predecessors. It was necessary, therefore, to pick up again the threads of Italian draughtsmanship at the end of the XVIth century. In the year 1589 Domenico Fontana, the well-known architect of Sixtus V., brought out a folio of illustrations of the means by which he had moved and set up the great Obelisk of the Vatican, generally known as the Guglia, in the piazza of St. Pietro. It was evidently the work of a draughtsman and engraver of a higher order than those who had worked for Serlio and Palladio. Fontana was perhaps the first to feel that fascination of scaffolding on which a well-known modern artist had played so skilfully. The book set up a new standard of architectural presentation, a method far ahead of the summary, though suggestive, wood-cuts of Palladio. The next stage was to abandon the formal method of Fontana's plates and to introduce sky and landscape in combination with architecture, a freer perspective, and more suggestion of the atmosphere and of light and shade. There were plates in Giovanni Battista Falda's famous "Fontane di Roma" in which the architecture is in correct perspective, and his figures and landscapes were excellent.

To Fontana had succeeded Carlo Maderno, Bernini Borromini, and Rainaldi, clever men in their exuberant and unscrupulous way, but not great architects or draughtsmen. Bernini was far the most considerable figure among the artists of the two middle quarters of the XVIIth century. His word was law in France as well as in Italy until the revolt of the French architects over the additions to the Louvre; and probably no artist had ever obtained a position of such unquestioned supremacy. But Bernini was from the first a sculptor, and a sculptor who, almost by instinct, rebelled against all restraint; and, though he did a great deal of architecture, some of it in a way of first-rate importance, he never looked at things from the standpoint of an architect, and was one of the most conspicuous offenders among that not inconsiderable class of artists who had regarded architecture only as so much stage scenery. He felt his way to vaguely realised efforts, and this failure, both in his training and in his habit of mind, was apparent in such of his architectural drawings as he (the lecturer) had come across. The passion for dramatic effect, always latent in the Italian, began to assert itself in the XVIIth century with ever-increasing insistency, until it finally overpowered their sense of architecture and substituted mere stage effects for that grave and serious art. There were still able architects, but Italian architecture was on the wane, and the slip-shod architectural drawings of Bernini and Borromini were evidence of its failure. Unless a man was a fine draughtsman it was almost impossible for him to be a fine architect. He did not mean that an architect was to devote himself to turning out magnificent drawings; far from it; he had greater work to do. Rather, by a severe gymnastic of drawing he should have trained his eye to the subtleties of form and composition, and his hand to interpret his ideas without hesitation and failure. Great painters did not parade their draughtsmanship, but it was implicit in their work. So, too, was it with architects; their draughtsmanship was shown in its highest form, not only in the beauty of their profiles, but in the scale, proportion, and composition of their buildings. But these qualities were only to be reached and fully realised through the assiduous study of great examples of the past, by means of which the architect accumulates a wealth of realised ideas in the background of his own imagination, trains his eye to seize at a glance the essential qualities of design, and his hand to interpret his conception without those mischances and blunders which lie in wait for the incompetent draughtsman. The purely technical drawings (*i.e.*, working drawings) made by such men as Bernini and Borromini were inferior to the drawings of Bramante, Peruzzi, and the two Sangallo, and it was evident that they were not real masters of this branch of their art, but were fumbling about for a motive in the hope of coming on it unawares in the tangle and confusion of their tentative lines. On the other hand, their dexterity in putting in figures and details of rococo ornament was amazing.

The lecturer then referred to the topographical work of Canaletto and his school, and the theatrical designs of the Bibiena family. The R.I.B.A. possess thirty-one original drawings of Giuseppi Galli Bibiena, most of which show an astonishing ability in draughtsmanship and mastery of perspective. But Bibiena was an artist of rather commonplace instincts and narrow range, and his archæology was simply absurd.

Piranesi, who was born at Venice in 1720, derived his fondness for composition of ruins from Ricci and Pannini. He was a draughtsman pure and simple, and not a painter. His earliest plates were issued in 1741, but his first serious publication of Roman antiquities and triumphal arches did not appear till 1748, followed by the "Carcere d'Invenzione" in 1750; and in 1751 his collected works up to date were published by Bouchard in a vast folio, entitled "Le Magnificenze di Roma le piu Remarcabili"—a miscellaneous collection carefully arranged, but splendidly printed on thick paper with noble margins—perhaps the finest publication of architectural drawings that has ever yet been produced. The "Antichita Romane," in four volumes, containing 216 plates, appeared in 1756, and was first dedicated to Lord Charlemont, but Piranesi considered his attitude so ungenerous that he removed his name and afterwards dedicated the work to Robert Adam. In 1761 Piranesi, who now described himself as "Fellow of the Society of Antiquaries of London," brought out his huge volume of "The Magnificence of the Architecture of Rome," in which he gave at great length his views of the origin of Roman architecture, and used his extraordinary ability as an etcher to demonstrate his quite erroneous argument. The "Diverse maniere d'adornare i Cammini," etc., appeared in 1769, and the "Vasi, Candelabri," etc., in 1778, the year of his death.

Piranesi's temperament was so complex and turbulent that he was a man of many manners, and the problem of disentangling these was made the more difficult by the fact that for years after his death his son continued to issue his father's plates with modifications of his own, and plates of his own from his father's drawings, just sufficiently like to be confused with his father's work by careless observers. Piranesi's art work is contained in Bouchard's folio. He did an abundance of work after that date, much of it very accomplished, but finish and elaboration took the place of the tense emotion that lay concealed beneath the surface of the wonderful plates that he made in the ten years before 1750. Even in his most restrained manner he could do wonders in the way of suggesting texture and reflected lights. Nor was his success merely technical. In nearly all his plates he succeeded in conveying an impression of that great scale, and of the magnificence of the buildings of ancient Rome, which from first to last were the predominant motives of his work, and became with him almost an obsession. He had a power of imparting to all he did a certain epic quality, some feeling of an heroic age long past that haunted his imagination, even to the tainting of its sanity. No one had ever approached Piranesi in his power of drawing architecture, though he was not a practical designer at all.

REPAYMENT OF LOANS FOR WOOD-BLOCK PAVING.

The Improved Wood Pavement Company, Ltd., have received the following letter from the Local Government Board:—"I am directed by the Local Government Board to advert to your letter of the 6th instant, and to state that they are now prepared to allow a period of ten years for the repayment of loans sanctioned by them for soft wood creosoted block paving."

THE CARPENTERS' HA LECTURES:

THE SCULPTOR'S CRAFT.

THE fourth of the present ser Carpenters' Hall lectures on "The Connected with Building" was delive Wednesday last week by Mr. T. S Lee in the Hall of the Company, L wall, the Rev. C. B. Bartlett, Past-M presiding.

Mr. Stirling Lee, the title of whose was "The Sculptor's Craft, with strations and lantern views," said brought his studio with him, and he in to take the craft side of sculpture there were one or two things he had and the first was that we have lost s the present day of the fact that sculp a language. Ruskin had well put it t history of a nation was written in books—*i.e.*, the book of its deeds, th of its words, and the book of its a three were necessary to complete but the only reliable one is the histo nation's arts. That was very true, arts were and could be only an expre time—*i.e.*, the work an artist wa missioned to do, and in the works of saw in exhibitions we got a very go of the ideals of nations. Sculptu written history; it spoke a language. men could read and write, when they to express their thoughts they did means of representations of things th and the earliest art was drawing on drawings of animals, because the artis hunters. This went on until the pe ideals, and we got symbolism—s language. So all through the ages s was a record of man's thoughts—hi and aspirations and the history of We were told by physiologists that of us use all the parts of our brain, was very true in regard to the art had in his brain the faculty, the form, which had to be controlled intelligence; and so without the sense and colour governed by ideals, with use of the intelligent part of his b artist became sensuous and degenera all had this faculty of form and col joy-giving sense, and the highest senses—*i.e.*, the sense of feeling, nation which did not develop thes of form and feeling was only ha and was cutting away the joy Nations which did not encourage were swept from the face of the ea those which had, had handed down to the greatest of riches the world ha If we did not develop this side of ou life we lost one of the greatest ch joy to the world. The nation whic encourage art was like a man w through the world blind because were not open to the beauty of it.

As to the evolution of these thi language; what was at first figura now phonetic. When the phonetic got to the printed language, the great use of the figurative langua to be, and so printing had more o placed or displaced the figurative No longer did people want the written on walls of their public for they had their books, and pri displaced the use of decorative though it could never destroy tha man which had the faculty of for who had that faculty were the pr lovers of it as long as man existed.

There were two essentials which the sculptor's work, and like ev art it must have its scientific b began where science ended, and t the two sides to sculpture work science of the human form, anatom science of geometry; and all th ages different artists were governe one science than the other. If th was plastic, or a modeller, anato assert itself in his work; if he w or a carver, the geometrical s govern his work. And the reason the clayworker builds up his wor carver carves down, and he (the proposed to show them how th built up the clay, and also how cuts his marble.

he lecturer, with a small clay model of a
before him, proceeded with pliable clay
uild up, on a movable lead pipe or skele-
stand, the beginning of a figure, bit by
He explained that every line must
into every other line and harmonise
t through. Every line should have some
ning, and there must be no stop anywhere
he flowing lines of the work. He also
ved the geometrical method of carving
istinction to the anatomical science, and
arked that directly sculpture was divorced
n architecture it became academic and
ly clay, for in sculpture related to archi-
ure the mason's side had to prevail, and
reason why a great deal of sculpture
r harmonised with architecture was
nse it was purely plastic.
he lecturer described some of the sculp-
s tools and then showed some lantern
es of beautiful sculpture work.

BOOKS.

norials of Old Gloucestershire. Edited
r P. H. DITCHFIELD, M.A. With many
ustrations. Demy 8vo. (London : George
llen & Co., Ruskin House, Rathbone-
ace. 15s. net.)

s is another of that excellent series of the
orials of the counties of England and
been edited by the general Editor, who
produced in this volume an admirable
ition to the numerous volumes of the
es already published, and has given a
prehensive review of the chief treasures
historic interest and antiquity of the
e. Of special interest are the accounts
the treasures of mediæval and ecclesi-
cal art that are to be found within the
ity, "the curious fonts, the Norman doorways with their quaint sculptures, the carved woodwork of the misericords, the bells that sound in minster and in church, the unique stained glass of the Fairford windows." The Editor contributes a chapter on historic Gloucestershire; Mr. E. A. B. Barnard on Winchcombe and Sudeley Castle; Miss M. Phillips Perry on the misericords of Bristol Cathedral; Canon Carbonel, M.A., on the Fairfax windows; and the Rev. Canon Bazeley, M.A., on Berkeley Castle, and an exceptionally able essay on the Norman doorways of the county is contributed by Mr. C. E. Keyser, M.A., F.S.A., accompanied by a unique set of plates illustrating the doorways and showing how rich in beautiful work of the kind Gloucester is. We are able to illustrate one of the doorways. The volume is worth possessing if only for this essay and the accompanying plates, but other interesting articles needing special reference are "Chipping Campden and Its Craftsmanship," by Mr. C. R. Ashbee, F.R.I.B.A., and "Gloucestershire Fonts," by Dr. A. C. Fryer. The article on the city of Gloucester, by Mr. J. Sawyer, contains illustrations of some of Mr. W. Leighton's drawings. We welcome another of these excellent "Memorials."

Everybody's Guide to the National Insurance Act, 1911. By THOMAS SMITH, Barrister-at-Law. (London : Chas. Knight & Co., Ltd., 227-239, Tooley-street, S.E. Price 1s. net.)

A GOOD many attempts have been made to explain this important and far-reaching measure, and such is its complexity that there is great need for a guide which will explain to everybody—or, certainly, to the great mass of the citizens who are, or will be, seeking for knowledge—what the Act means and how far they are affected by its provisions. The Bill as introduced was subsequently altered so much that even if the work of the Parliamentary draughtsman left nothing to be desired, the public might well be excused if they failed to understand to the full this new piece of legislation. The book before us is a non-political work, and the author has done much to explain the Act and make its meaning clear. The Act is arranged in sections, showing the effect on every class, so that anyone is at once in the position, on reading the book, to find how the new law affects him or her, as the case may be, and what steps it will be necessary to take to obtain the benefits which the Act affords.

South Doorway, Pauntley Church, Gloucestershire.
(From "Memorials of Old Gloucestershire.")

Laxton's Builders' Price Book for 1912. Originally compiled by William Laxton. Ninety-fifth Edition. (London : Kelly's Directories, Ltd., 182, 183, and 184, High Holborn, W.C.)

Lockwood's Builder's, Architect's, Contractor's, and Engineer's Price Book for 1912. Edited by FRANCIS T. W. MILLER, A.R.I.B.A. (London : Crosby Lockwood & Son, 7, Stationers' Hall-court, Ludgate-hill, E.C.)

IN dealing with these two works our remarks apply almost, if not quite, equally to both. Both are excellent in their way, and that way is almost identical. True, Laxton occupies the premier place, but that is principally on account of age, but although it can boast its ninety-fifth year there is no indication of senile decay. It is quite possible that the advent of the younger brother accounted to a large extent for the rejuvenation of the elder. The 1912 edition is quite up-to-date in the best sense of the word.

We have carefully gone through both, and find that the necessary revision has been carefully done, and it is a good sign that more revision has been necessary for this year than for some time past. There are curious little discrepancies in both in the calculations for cost of brickwork, and it is also strange that one allows 4s. per rod and the other 5s. per rod for scaffolding, while there is a difference of over 12 per cent. in the prices of labour only. But we must conclude that they are, after all, only consistent with the variations of prices shown in the bills of builders tendering for work. Whether it will ever be possible to standardise even such a definite matter as the pricing of brickwork is a very open question.

On page 354 of Laxton we would point out what is obviously a printer's error. Milled lead in sheets is priced at 1*l.* 11s. 6d.; this should surely be 1*l.* 1s. 6d. This is borne out by the subsequent prices for lead and labour. It, however, is some satisfaction to know that, notwithstanding a careful examination of the work, this is the only real error that we have traced.

Again we have pleasure in praising both works for their thoroughness and care in production with the reservations we have so often mentioned before—the difficulty of really supplying a standard—and which is emphasised by the references we have given. We could give many more did space allow.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Edward White, Chairman, presiding.

LOAN.—The Finance Committee recommended, and it was agreed, to make a loan of 20,200*l.* to the Westminster City Council for the purpose of obtaining through communication from Great Marlborough street to Noel-street.

SCHOOL SHELTER.—It is proposed to erect a small shelter in the boys' playground at the All Saints' School, Putney Bridge-road.

SOUTHERN HIGH LEVEL SEWER.—In connexion with the construction of the Southern High Level Sewer No. 2, a local sewer in Ivydale-road, Nunhead, is to be connected with the Southern Sewer at a cost of about 185*l.*

NEW STORE.—A permanent store is to be erected at the Barking outfall works at an estimated cost of 350*l.*

THEATRES, ETC.—The following drawings have been approved by the Committee :—226, Commercial-road (Yiddish Theatre)—arrangement of the safety curtain, arrangement of electrical switchboards, battens, ventilation, etc.; Down-place, Hammersmith (cinematograph hall)—formation of exitway; Hotel Cecil, Strand—electrical arrangements for the winter garden; Queen's Hall, High-street, Peckham—enlargement of the entrance vestibule; Royal Academy of Music—sundry minor alterations, lighting and mechanical arrangements; Upper Tooting-road and Fircroft-road (cinematograph hall)—adaptation for use as an office of a shop on the side of the entrance vestibule.

NEW BUILDINGS.—It is also proposed to erect a new dining hall at the Imperial Hotel, Russell-square, and a new cinematograph hall is to be erected at 234, Pentonville-road, N.

COTTAGES AT WALLSEND-ON-TYNE.

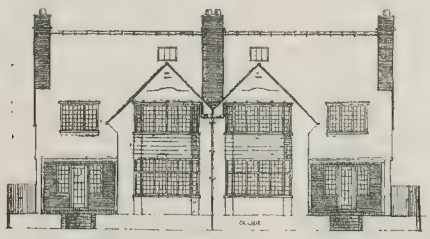
THE cottages illustrated on this page represent a type of domestic architecture that is rapidly coming into favour in the district with people who require a house of moderate accommodation and cost. They are planned so that the principal rooms face south, with the portico, hall, and out offices north. The brick-paved paths make a pleasant feature to the interior porches, which are also paved in bricks.

TRAFFIC REPORT OF THE BOARD OF TRADE.

ONCE again the London Traffic Branch of the Board of Trade calls attention to the stupendous nature of the traffic problem. We rise from a study of the fourth Annual Report with an overwhelming sense of the vastness and intricacy of the subject and of its vital importance to the welfare of London. Whatever preconceived ideas we may have had on the subject of town planning, this Report does bring home to us with irresistible force the fact that the traffic practically governs everything, and, in the present state of London, is the one subject that most requires immediate attention.

The Royal Commission on London Traffic, which reported in 1905, found that the difficulties of the traffic were largely due to the narrowness of the streets and to the lack of any general comprehensive plan, and suggested an investigation into the adequacy of the main arterial roads.

In consequence of this suggestion, an inquiry was begun by the Traffic Branch in 1909, further results of which are now published continuing those already published in 1910. Some excellent maps are included in the appendices to this Report, showing, in addition to other information, the volume and nature of the traffic on the main roads and bridges leading out of London.

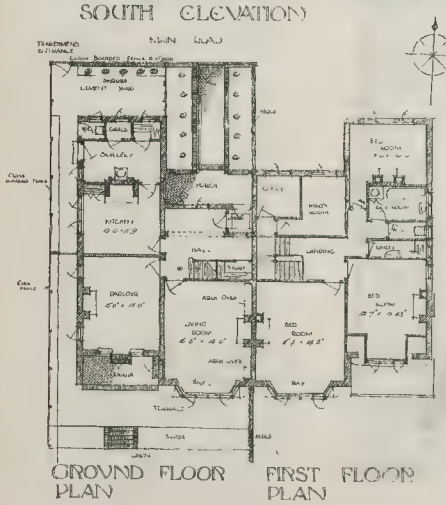


It is perhaps not too much to say that this problem of the arterial roads is the most important of all, or, at any rate, the one most in need of immediate attention, in view of the preparation of town-planning schemes now being taken in hand by various local authorities within the radius of Greater London.

It is obvious that such local schemes should be brought into proper relation to and form part of a general scheme. But as this Report points out, although the publication of last year's Report lead to inquiries from local authorities, yet

"From the point of view of the local authorities, there are two main difficulties in adopting the scheme. The first is the absence of such assurance that a proposed road will be carried through from end to end, as would justify a particular authority in undertaking the construction of an isolated section. The second arises from the likelihood of claims being made for compensation in respect of land over and above the statutory width which should be reserved in order to secure a minimum of 100 ft.—claims which a local authority might be unable or unwilling to meet without assistance. There is, however, reason to hope that where new roads would greatly benefit their estates, owners of large properties would be willing to give the additional width on favourable terms, if not free of cost, where satisfied that the roads would be completed throughout. It will, moreover, often happen that the line of a proposed new road runs through an area which, being developed, cannot be included in any town planning scheme. The construction of such a road might involve the purchase and demolition of buildings, entailing expense, which no single authority could face unassisted even if—as would seldom be the case—the road, when constructed, would be of greater benefit to the district through which it passes than to places further afield. There are also cases in which a proposed line traverses open country not yet ripe for development. Here, although the construction of such sections would not be costly, and extra land could easily be reserved, it is hardly to be expected that local district councils would be prepared to incur the expense out of their own limited resources.

As joint action is clearly indispensable in such cases, it would seem to be desirable that the central authority should be charged with the duty of conferring with the county councils and other authorities, landowners, and others, with a view to arrive at a common agreement both as to the precise line to be adopted, and as to the apportionment of the cost. A settlement of this kind would be facilitated if the inducement of a substantial assistance from public funds could be held out in such cases such as those already referred to. The money, which could properly be allotted to the improvement of traffic facilities in the Metropolitan district, using the term in a wider sense, could undoubtedly be laid out to far greater advantage in procuring the construction of roads in the outskirts, where the value of property is rising, buildings are multiplying, and traffic would add each year to the cost of improvements, rather than in fully developed districts near the centre, where the cost of improvements would be little, if at all, greater a few years hence than it would be now.



If local authorities and private owners were encouraged to adopt approved lines, in connection with town-planning schemes, by giving assistance from public funds towards the expense of constructing connecting sections, it might be found that the formation of many miles of arterial road could be secured at a moderate cost. Roads which will have to be made in any case for local purposes, could be so laid out as to meet the requirements of arterial communication, and if suitable lines were adopted from the first it would rarely be difficult to bring the ultimate into conformity with them without any sacrifice of local convenience. Town-planning roads, on the other hand, laid out independently, without reference to a general scheme, so far from assisting it, might actually stand in its way, and would be of little or no use except to the authorities concerned. It is therefore suggested that attention should be directed to this question without loss of time, not only with a view to secure the early provision of improved communications which are so urgently required, but also to obtain for the community the best value for their money."

Cottages at Wallsend-on-Tyne. Mr. Edward Cratney, Architect.

ough the general conclusions of the Branch seem eminently reasonable, and cessity for new or widened arterial proved up to the hilt, there is another of the question which, we think, must e lost sight of. Where a road is ed there seems to be two ways of with it—either widen the road or the amount of the traffic. In a town as grown to such an enormous and dy size without any definite plan, it s evident that the lack of any proper tions of its various trades in relation to otlier or to the railway centres creates ormous amount of traffic which is, speaking, unnecessary, or rather be so if the life of the town was better ed. Even as things are at present, the nts for a general Clearing House for supports the contention that much of sent traffic is quite unnecessary and better organisation would result in a elief to the streets.

suggestion naturally presents itself that o aspects of the question should be together with a view to the suppression ecessary traffic where possible before expense is incurred in widening. , in some cases where the cost of g a congested road or of creating a oad is altogether prohibitive, this he only hope left to us.

is much to be done in the same n by the better organisation of the tion of goods and by the better on of the traffic generally. Such, for e, is the proposal for an underground for the conveyance of mails, which ake 1,000 Post Office motor-vans off ets which now perform 5,000 to 6,000 ervices. The Report notes the relief would be thus afforded, particularly ystem were extended to the general tion of goods, but, of course, still relief would be gained if the dis- g centres were properly placed.

tain a proper basis for the production a general scheme for London as is vely required it is obvious that a survey of the life of London and an ve inquiry into the whole of its nents will be necessary. Such a undertaking could probably only be by those possessing the authority urces of a Government department. rsuit of data on which to found its ns for new or improved roads the Branch has collected much valuable ion as to the recent growth, density, ration of the population, as well as robable growth in the future. The lking fact in this connexion is that rst time in more than a hundred years ulation of the administrative county m to decline. The increase in the g is greater than ever, while beyond r ring considerable increases have lace in many localities up to 30 more from the centre.

impossible within the limits of a o do justice to the immense amount nation contained in this Report. It t only with population and arterial t with street improvements, bridges nels, public carriages, tramways, steamboats, strikes, and the regula- traffic, to which is added a dum by the Home Office. Numerous es give exhaustive statistics on all bjects, and the eight maps which y it are by no means the least part of the report which should be y all interested in the subject. To nt of town planning it is a mine of on and suggestion.

LEGAL COLUMN.

Obstruction to Light.

cent case, Griffith *v.* Richard Clay & ., the defendants admitted obstruction n ancient lights, and the plaintiff, aived his claim to an injunction, the ion for the Court was the assessment es.

laintiff's premises comprised two houses let at weekly rentals and a e at the back. The district was no sidential, and the buildings were very would soon have to be demolished. lights of the dwelling-houses appear een obstructed, and the question was raised whether in assessing the damages only the site value of the dwelling-houses was to be considered or the site value of the whole area. The Court adopted the latter view.

Mistake at an Auction.

A curious point in connexion with an estate sale has recently been raised in one of the County Courts. The vendor had placed a reserve upon one of the lots to be sold by auction of 375*l.*, but by an oversight it had been entered in the auctioneer's sheet at 170*l.* The mistake was discovered during the bidding, but the lot was knocked down at 170*l.* before the auctioneer became aware of it. The plaintiff in the action was the purchaser, who was claiming specific performance of the contract against the vendor. The plaintiff contended that this was not an auction subject to a reserve price, because the fact was not specifically stated, although certain sale conditions were incorporated which did contain such a condition.

The Judge found that the plaintiff knew that the sale was subject to reserve, and therefore had sufficient notice. The Court decided that the plaintiff could not claim specific performance of an agreement which, if entered into at all, was made through a slip or mistake on the part of the vendor's agent unaccompanied by gross negligence, and judgment was entered for the defendant.

When a sale is subject to a reserve price, and the fact is known, it has been held by the Court of Appeal that the offer of the auctioneer to sell, the bidding, and the knocking down of the article to the highest bidder, are all subject to the condition that the reserve price shall be reached, and the bidder has no right of action against the auctioneer either for breach of duty in refusing to sign a memorandum or otherwise to complete the contract, or for breach of warranty of authority to accept the bid (McManus *v.* Fortescue, 1907, 2 K.B., 1).

In another case, Rainbow *v.* Hawkins (1904), where an auctioneer had inadvertently knocked down a pony without reserve, and immediately on discovering his mistake put it up again, the Divisional Court held that the action against the auctioneer failed because no memorandum of the sale had been made. These are both cases where the action was brought against the auctioneer, not as in the present case, where the action was brought against the vendor; but in the latter case it was intimated that as an auctioneer has an implied authority to sell without reserve, unless that limitation is brought to the notice of the purchaser, the purchaser would have a right of action against the vendor if a memorandum of sale existed.

LAW REPORTS.

Right to Injunction in an Ancient Light and Air Case.

In the House of Lords on Thursday, the 15th inst., Lords Macnaghten, Atkinson, Shaw, and Robson disposed of an appeal brought by Mr. H. M. Cockerill against an order of the Court of Appeal in favour of the respondents, the Middlesbrough Co-operative Society, Ltd.

Mr. Tindal Atkinson, K.C., and Mr. Edward Shortt, K.C., instructed by Messrs. Tatham & Lousada for Messrs. Faber, Fawcett, & Faber, Stockton-on-Tees, appeared in support of the appeal; Mr. Waugh, K.C., and Mr. J. A. Slater, instructed by Messrs. Griffith & Gardiner, for Mr. M. W. Hutchinson, of Middlesbrough, for the respondent Society.

Mr. Atkinson, in opening the case, said the plaintiff owned some cottages close to where the buildings of the defendant Society were erected, and he brought his action at Leeds in March, 1910, to recover damages for obstructing the access of light and air to his premises by the erection on the defendants' adjoining land of a warehouse and other buildings, and for nuisance and for breach of an agreement alleged to have been entered into between the parties in the previous April. Further, he claimed an injunction to restrain the defendants allowing the new buildings to remain in such a condition as to diminish his light and air, otherwise than as agreed. The defendants denied there was any such nuisance as the plaintiff alleged.

At the trial, the jury, by consent, were discharged, Mr. Justice Ridley agreeing to the request of the parties that there should be a report on the premises made by Mr. G. T. Brown, of Sunderland, who should answer certain questions framed as the basis on which he should make his report, and that he should find what damages (if any) the plaintiff had sustained by reason of the alleged breach of the agreement, if it was found by him that the common law rights of the plaintiff had not been infringed.

In his report he found that the plaintiff had suffered no damage.

The question whether in these circumstances the plaintiff was entitled to a mandatory injunction was reserved for further argument before the same Judge in London. The short point of law was this:—

The plaintiff said that the substance of the agreement was that the defendants would not so erect the warehouse to such a height as would obstruct his ancient lights, and that the roof should be, by arrangement between the plaintiff and the defendants' architect, pitched as low as practicable. The roof was pitched at 34° 4′. The plaintiff alleged that a pitch of 30° (a degree more or less to be considered immaterial) alone satisfied the words "as low as practicable."

Mr. Justice Ridley, in giving judgment, declined to treat the arrangement to be come to as to the pitch of the roof as a negative covenant, and therefore refused to grant an injunction.

Lord Macnaghten: Why do you say the learned Judge was wrong? Surely it is a matter of discretion.

Mr. Atkinson said it was not a matter of discretion. In 1868 Lord Cairns, in delivering judgment in Doherty *v.* Allen, three Appeal Cases at p. 719, where he was dealing with a covenant to repair a building, and the remedies and rights of the parties under that covenant said:—"If the parties, for valuable consideration, with their eyes open contract that a particular thing shall not be done, all that a Court of Equity has to do is to say, by way of injunction, that, which the parties have already said by way of covenant, that the thing shall not be done; and in such case the injunction does nothing more than give the sanction of the process of the Court to that which already is the contract between the parties."

Lord Atkinson: You contend that if a man says, "I agree to pitch the roof as low as practicable," it is equivalent to his saying, "I will not pitch the roof higher than it is absolutely necessary."

Mr. Atkinson: My submission is that where it is found that the parties agreed that there should be an undertaking given by one not to do a thing a particular way, and there is a breach of that negative covenant, the other party as of right can claim an injunction.

Lord Atkinson: But there was no agreement that the roof should be pitched at a certain degree.

Mr. Atkinson: No. There was an agreement that it should be pitched as low as possible. There was no evidence that the plaintiff knew that the respondents were building the roof in such a way as to be a breach of their negative undertaking, or that he knew or could have known the height or pitch of the roof until it was completed.

Mr. Shortt followed on the same side, without hearing Counsel for the respondent.

Lord Macnaghten said that in this case the Court of Appeal had affirmed a decision of Mr. Justice Ridley, who had refused, in his discretion, to grant a mandatory injunction. In his opinion, that decision was right. It seemed to him that the Court of Appeal, where elaborate judgments had been delivered, had treated the question raised with too much ceremony. It was not necessary for him to trouble the House with the facts in order that they might pass their judgment on whether this undertaking amounted to a negative covenant, which on the authority of Doherty *v.* Allen should be enforced by mandatory injunction. Whether on the facts disclosed an injunction should be granted was a matter of discretion for the Judge. Mr. Justice Ridley had refused to grant an injunction. It was perfectly clear that no damages had in fact been sustained by the plaintiff, and therefore he should merely move that the appeal be dismissed with the usual consequences.

The other noble and learned Lords concurred.

Order accordingly.

Euston-Road Building Line: High Court Application.

On Friday, February 9, before a Divisional Court of the King's Bench Division, composed of Justices Hamilton and Lush, Mr. Daldy applied *ex parte* on behalf of the London County Council for a *rule nisi* to the Tribunal of Appeal under the London Building Act to show cause why they should not state a case for the opinion of the Court.

Counsel said that under the Act the determination of the general line of buildings in any particular street or part of the street was in the first instance carried out by the

Surveyor and the Superintending Architect, but against that certificate the Act gave an appeal—which was an appeal both on facts and law—to what was known as the Tribunal of Appeal. From that Tribunal there was an appeal by way of a case stated on questions of law to that Court.

His present application had regard to a difficulty that had arisen in respect to Euston-road. There was the certificate of an architect as to the general line of the buildings in a certain part of Euston-road, and there was an appeal to the Tribunal of Appeal in connexion with which many people appeared.

There were originally five appellants, and there were interested parties who were also called. The Tribunal decided the case in a certain way, and there was an application for a case or cases to be stated. The Tribunal took the view that there were five different proceedings before them, in each of which they ought to give a separate determination and state separate cases. The question for their Lordships was whether there ought to be one or more cases. There were now three appellants only, said Counsel.

Mr. Justice Hamilton: Do you say the Tribunal propose to state three cases?

Counsel: Yes. We ask that there should be one case stated, to which all the parties who appeared before the Tribunal of Appeal should be named.

Mr. Justice Hamilton: If there were three cases raising the same point, I take it they would all be in the paper together, and judgment would not be given until they had been argued, and the three respondents would be heard separately.

Mr. Daldy said that the London County Council would be the respondents in every case here, and with three cases it would amount to a very considerable quantity of litigation. He agreed with what Mr. Justice Hamilton had said with regard to each party having the right to a separate case; but, as his Lordship was probably aware, the House of Lords had decided that the determination of the position of the building line was not the determination as between the Superintending Architect and any particular party who had a house along that line of building, so that it might be left open to a party having a different house to get another determination.

Mr. Justice Hamilton: Is there any divergence in the arguments of these different appellants?

Counsel replied that he believed that with one slight exception their contentions were practically the same.

Mr. Daldy proceeded to quote legal sections dealing with the determination of the general line of buildings in streets and the provisions concerning the stating of a case for the opinion of the High Court on questions of law, and said he submitted that a local authority or anybody who had a grievance might go before the Tribunal of Appeal, and any party interested could also go before them and be heard. The Tribunal of Appeal had to state a case for the opinion of the High Court on any question of law involved in any appeal submitted to them.

Mr. Justice Hamilton said he saw the Tribunal of Appeal had given an elaborate statement as to its refusal to comply with Counsel's wishes, and it was stated that it would be difficult to consolidate the points of law and facts in one combined case, and it might create hardship, whereas it was simple to state in three cases, and they thought that would be more conducive to justice being done.

Counsel, in further reply to the Court, said that originally there were five parties who gave notice to appeal, and the London County Council were the respondents.

Mr. Justice Lush: Then the Tribunal of Appeal might not, by their decision, satisfy the appellants or the respondents?

Counsel said that in this case the Tribunal of Appeal had "broke out" with a judgment which was unexpected by the parties concerned. The Superintending Architect had defined the general line of buildings along a certain part of the Euston-road, and the whole discussion was with reference to that length in which the particular line was situated. The Tribunal of Appeal rightly or wrongly divided it into three, and defined building lines in three different parts of the street. Something was decided by the Tribunal which neither of the parties had asked for.

Counsel added later that if the rule were granted it would have to be served on the appellants and notice given to the parties interested. There were appellants as to the middle part, and as to the west end the Metropolitan Railway Company would be made respondents and the London County Council would be made appellants.

Ultimately, after further discussion, the rule was granted.

KING'S BENCH DIVISION.
(Before Mr. Justice COLERIDGE and a Special Jury.)

Padbury *v.* Holliday & Greenwood, Ltd., and Others.

IN this case Mr. Alfred Goulton Padbury, of 64, Brownlow-road, N., claimed damages for personal injuries from Messrs. Holliday & Greenwood, Ltd., builders and contractors, of Loughborough Park, Brixton. The action involved an interesting question in regard to liability for an accident on January 4, 1910, and the defence embodied a general denial of such liability.

Messrs. Holliday & Greenwood had been erecting premises at the corner of Fenchurch-street and Lime-street in January of last year, and Messrs. Wainwright & Waring, of Chiswick, as sub-contractors, were engaged to fix in casements for the windows. Plaintiff passed the building on January 4, and was struck by an iron cramp that fell on his head and rendered him unconscious. He was taken to the hospital on an ambulance, and now told the Court what he had suffered in consequence of the accident. His right side, he said, was partially paralysed for a time; loss of memory since the accident had necessitated the use of a dictionary when writing letters; he was unable to resume work for over eight months, and now had to wear glasses when writing or reading. His doctors did not think he would ever be "the same man again."

Mr. Wainwright, director of Messrs. Wainwright & Waring, Ltd., gave evidence in support of the claim. He said his company were originally coupled as defendants to the action, but as against them the case was discontinued.

Mr. Spencer Bower, K.C. (for Messrs. Holliday & Greenwood): How did it come to be discontinued?

Mr. Wainwright: By the plaintiff's solicitor seeing me. I gave him an account of our position in the matter, and the terms of our sub-contract.

Witness added that when his company tendered to supply the window casements it was understood that they should have the use of the defendant's scaffolding, etc.

It was urged, on behalf of the defendants, that they were not responsible for the accident, inasmuch as it was caused by an employee of a sub-contractor letting the iron cramp drop. Mr. Spencer Bower submitted that there was no evidence of liability as against Messrs. Holliday & Greenwood. The sub-contractors, he said, were in control of the third floor, from which the cramp fell, and, he argued, plaintiff could not rely upon any alleged contractual relations between the builders and sub-contractors.

Mr. Benjamin Greenwood, a director of the defendant company, stated, in evidence, that they had no voice in the selection of Messrs. Wainwright & Waring, and they had nothing whatever to do with the erection and supply of the window casements. While the defendants' men were erecting the building all reasonable precautions were taken to guard against accidents; but after the building was roofed in the scaffolding, etc., was removed in the usual way. They were under no obligation to take precautionary measures in connexion with the work executed by Messrs. Wainwright & Waring.

The jury eventually awarded Mr. Padbury 500*l.* damages, and his Lordship granted the defendants a conditional stay of execution with a view to the possibility of an appeal.

KING'S BENCH DIVISION.
(Before Mr. Justice AVORY and a Common Jury.)

Personal Injury:
Chapman *v.* Greenwood, Ltd.

THIS was an action by Mr. James Chapman against Messrs. Greenwood, Ltd., builders, of Arthur-street West, to recover damages for personal injuries.

Mr. McCall, K.C. (for the plaintiff), said Mr. Chapman was injured in St. John-street, Clerkenwell, last May, by a brick falling on his head while he was passing a house where employees of the defendant company were at work. The bruise on the plaintiff's head was so serious that he was unable to work for sixteen weeks. His wages were previously 28s. a week, and since the accident he had only been able to earn 5s. or 7s. a week. In addition to his loss of wages, the plaintiff had incurred out-of-pocket expenses, including medical attendance, to the amount of 30*l.* 16s.

Mr. James Chapman, the plaintiff, a man twenty-four years of age, living with his father off the Goswell-road, gave evidence confirming the statement of Counsel. He said that while passing 423, St. John-street, on his way home to dinner, a brick fell upon his head, causing him to be dazed for a while. He fell a hoarding, and a man, whom he took the foreman, came out and said he was giving him 1s. for some brandy, and to be informed if anything serious hap

The defendants did not dispute liabili questioned the amount of damages cl which, it was said, was out of propor the injuries sustained. In support of th tention witnesses were called.

Eventually the jury awarded Mr. Ch 87*l.* 12s., including doctor's fees, and ju was entered accordingly. His Lordship o that 25*l.* paid into Court by the defe should be paid out to the plaintiff.

LONDON COUNCILS.

Bermondsey.—Plans have been pass Messrs. Joseph & Smithem, architec Queen-street, E.C., for the erection of a ing abutting upon Essex-place.

Fulham.—A plot of land adjoining Wharf is to be leased to the Asiatic Pet Company, Ltd., on which the company p erecting stables. Mr. A. Dawkins, on be Mr. R. B. Mason, has had plans passed erection of twenty-three houses on the n side of Clancarty-road, and six houses eastern side of Peterborough-road.

Hackney.—The Public Libraries Com have decided to invite Mr. E. F.R.I.B.A., to prepare plans, specific etc., for the erection of a branch libr Northwold-road and one at Brooksby's also to appoint him architect to superv erection of the buildings at 5 per cent. cost of each of the buildings.

Hanwell.—The Surveyor has been ins to prepare plans for open-air baths lower portion of the Churchfields, Warncliffe-viaduct.

Poplar.—A plan has been passed for J. Chessum & Sons for the erection o tions to the Poplar Hospital.

Watford.—At the last meeting of the District Council the tender of Messrs. Potter & Co., Borough, S.E., at 4,967 accepted for the construction of a w boreholes in connexion with the Counci waterworks scheme. Plans have been for Messrs. Bracey & Clark for three Ashby road, also for Messrs. Barker & S alterations to a part of the frontage High-street.

West Ham.—The following plans ha passed:—Messrs. J. Chessum & Sons, sions to offices at Messrs. Jenson & Nich premises, Warton-road, Stratford; Mes Gladding & Co., showroom at Mes Ingram, Clark, & Co.'s premises, Abbe West Ham; Mr. P. Tree, offices, store at West Ham Chemical Works, Cannin West Ham; Mr. R. Living, warehous at Messrs. Jeyes' premises. Richmond Plaistow; Mr. J. R. Moore-Smith, wo etc., at the Gas Lighting Improvemen pany's premises, Crow's-road, West Plans have been lodged by Mr. A. OBITUARY.

Mr. T. M. Rickman.

We briefly announced the death Thomas Miller Rickman, whose funera place at Finchley on the 14th inst., last issue. The funeral was attended by relatives and friends, as well as by re of societies to which he belonged. We received the following additional remark one of the pupils and assistants of t ceased:—

"Practising as an architect till the sixties, he found the real field for his in the profession of quantity surveyor, practice he carried on till within a few of his decease at the ripe age of eight There is perhaps no man living who much for his profession, which he carr the highest standard. The very large n of pupils and assistants, many of who

practice, bear testimony to his wonder-
ity. Past-President of the Surveyors'
on, Past-President of the Architectural
ion, A.R.I.B.A., A.M.Inst.C.E., F.S.A.,
great personality and genius com-
itself to all who knew him. He has
most of his *confrères*, but we feel that
man has passed away. He was
ientious, upright, and high-minded.
ther's "Gothic Architecture" is
standard work. His great practice
ost intimately associated with the
r. Alfred Waterhouse and many
rchitects of the late Victorian
o enumerate, therefore, the public
s with which he was so closely con
would need a column in itself. This,
ure, would not be pleasing to him, and
only say that colleges at Oxford and
ge, Manchester, and Leeds, public
hospitals, and other institutions may
mething of the great genius, whose
were by no means confined to his pro-
who has gone from our midst."

PATENTS.

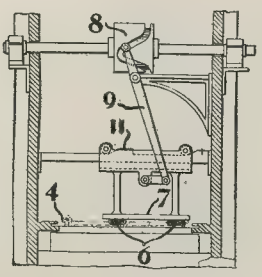
atus.



SELECTED PATENTS.

f 1910.—Conrad Dressler: Moulding

lates to tile-presses having upper
pressing-plungers *e*, *f*, wherein the
ngers are depressed several times in
by means of a cam *g* having pro-
ngaging with toggles *h*, so as to
series of compressions and free the
completely from air. The plungers
lly retained by springs, and exces-
ure is prevented by a spring device
of two sets of circular dished
Material is fed into the moulds by
q, which is reciprocated by lever
i actuated by a cam. The bottom

14,661 of 1910.

tiles by means of levers *m* operated by a cam-actuated rod. An extension of the feed-box *q* engages with the discharged tiles, and pushes them forward to a bur-removing device comprising gauze-covered frames 4, past which the tiles are pushed, and transverse gauze devices 5 mounted upon a frame 7, which is reciprocated by a cam 8 and lever 9, being normally elevated upon cam-surfaces 11. The finished tiles pass to a receiving table 12, supported by a spring 15, which is successively depressed to receive a pile of tiles by means of a ratchet 17 operated by the lever *m*.

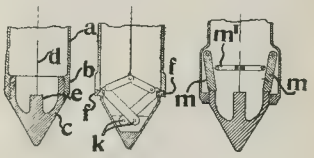
20,149 of 1910.—John Wulstan Twinberrow: Mixing concrete.

This relates to an apparatus for mixing concrete in which the materials are placed in a container adapted to be removed by a crane to the place required, the container being also agitated to mix the materials by means of the crane, which apparatus is provided with trunnions on the container adapted to enter supports to allow the container to be reciprocated. The container *a* is provided with

20,149 of 1910.

cross-bars *k* for mixing the material, a charging-opening *b* provided with a tightly-fitting cover held in place by a lever *d* and link, and trunnions *m* which can be caused to engage with supports in a bracket *n* attached to the jib of the crane. One end of the container is formed as a water vessel *g* communicating with the remainder by a pipe *i*. To the lower end of the container are attached pieces *p* so formed as to ensure the container falling on its back when lowered on to the ground.

21,316 of 1910.—James Henry MacDonald: Concrete paving.



This relates to a reinforcement to be entirely embedded in the concrete for concrete paving, which reinforcement consists of two vertical series of sheet-metal bands intersecting at right angles and stamped with openings; the skeleton is laid directly on a prepared bed.

22,659 of 1910.—Matthew Parry and Douglas-Stuart Gladstone: Ventilation chimneys.

This relates to a system for improving the ventilation and chimney draught in dwelling-houses, which comprises outlet bends and ducts placed near the ceilings of the apartments, and other bends placed in the four sides of the stack so as to catch the wind. Caps of wire gauze are placed over the bends.

22,695 of 1910.—Moritz Kahn: Piles.

This relates to a preparatory hollow pile which is provided with a detachable shoe and means for withdrawing the shoe through the pile. The shoe, *c*, is screwed into the preparatory pile *a*, and has a square neck *e*. When the driving operations are complete, a tubular spanner is used to screw the shoe into the pile, until the screw-threads are disengaged when the shoe is raised by the

22,695 of 1910.

chain *d* or by spring pawls on the spanner. In another form segmental levers are mounted on links pivoted at *k* to the shoe and attached to the lifting-chain. The tube is slightly raised so that, upon pulling the chain, the flanges *f* are moved inwards clear of the tube when the shoe is ready for removal. The tube may carry pawls *m*, which bear on the shoe during driving operations, but are moved out of the way by a ring m^1 when the operations are complete so as to enable the shoe to be drawn up.

TRADE CATALOGUES.

We have received from Messrs. Benham & Sons, Ltd., of Wigmore-street, W., a booklet describing their "Perfect" system of hot-water heating for buildings, and pointing out the special advantages carried by the system. Briefly stated, the method adopted is to place a circulating pump on the return main close to the boiler, the pump being operated by a small electric or other motor, as may be most convenient. One effect is to accelerate the flow of water throughout the entire installation, replacing the slow movement due to gravity by a rapid circulation, which distributes heat generated in the boiler in a most efficient manner. Other beneficial effects are:—(1) That the main and branch circulation pipes can be reduced to about half the diameter of those requisite in a gravity apparatus; and (2) that the boiler can be placed at any level instead of having to be fixed in a basement or in a chamber excavated for the purpose. Naturally, the smaller pipes are less costly and do not cause the disfigurement hitherto so common. Moreover, the cost of installing pipes and the boiler is considerably reduced. The new system is one which we have pleasure and confidence in commending to the attention of architects and others interested.

We have received from the old-established firm of Messrs. Francis Morton & Co., Ltd., of Garston, Liverpool, and 27, Victoria-street, London, their latest net price-list for wrought-iron and wire fencing, railing, gates, etc. In the course of their seventy-odd years' experience the firm have executed numerous orders for many of the largest railway companies, corporations, land owners, and gentry in the United Kingdom and abroad, and they are, in addition, large manufacturers of steel bridges and girders, and steel constructional work generally.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number**: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xviii.; Auction Sales, xxiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

THE QUANTITY SURVEYORS' ASSOCIATION.

An extraordinary general meeting of the members of this Association was held on Monday evening last at Caxton House, Westminster, S.W., at which the following by-law was adopted:—

"No Member or Associate of the Association shall prepare Bills of Quantities for less than the Schedule of Charges recommended by the Association for adoption by Public Authorities, excepting only in cases where a Public Authority may have already issued a special scale of charges for their particular work. No Member or Associate shall under any circumstances work for the said Authority for a lower remuneration than this special scale.

"Any Member or Associate of the Association who shall act in contravention of this by-law shall be considered guilty of conduct prejudicially affecting the reputation of the Association, and shall be dealt with by the Council as provided in Clause 29 of the Articles of Association.

"It shall be the duty of the Members or Associates of the Association to acquaint the Council, through the Secretary, of the existence of any scale of charges issued by any public body which stipulates lower rates of charges than those recommended by the Association, in order that the Council may communicate with the public body in question, with the view of endeavouring to prevail upon such public body to make their scale conform with that of the Association."

FOREIGN AND COLONIAL.

Building Construction and Material, Southern Nigeria.

The official *Lagos Customs and Trade Journal* of January 2 states that tenders are invited for the construction of a new General Post Office at Lagos. Copies of the specifications and bills of quantities may be obtained from the Director of Public Works, Lagos, on deposit of 10*l.* 10s., which will be returned on receipt of a *bonâ-fide* tender. No date is mentioned to which tenders will be received. The *Customs and Trade Journal* points out that the rapidly expanding trade of Lagos affords opportunity of substantial business to British builders. The Government expenditure in Lagos this year on new works and buildings is estimated at 68,000*l.*, including 15,000*l.* for quarters for officials, 5,000*l.* for a new wing to Government House, 11,500*l.* for the new General Post Office, etc. Further, as the trade of Lagos and the wealth of the people increase, substantial buildings are taking the place of the shanties and huts formerly used, and a large business might be done with private individuals.

Building Works, Brazil.

The *Diario Official* of January 5 publishes the text of the Brazilian Budget expenditure for 1912 as per law No. 2,356 of January 4, 1912. Among the items of interest the following may be noted:—

The Ministry of Justice and Home Affairs is authorised to expend 700,000 milreis (currency) for continuing building operations and carrying out improvements at the Pedro II College, the Central Disinfecting Institute for Public Health, the Library of the National Institute of Music, and at the Benjamin Constant Institute; 168,000 milreis (currency) for the purchase of fire extinguishing appliances, etc., such as pumps, fire alarms, and motor fire-engines; 350,000 milreis (currency) to complete the building and equipment of the hospital for tuberculosis; 272,575 milreis (currency) to complete the National School of Fine Arts.

The Ministry of Marine is authorised to expend 30,000 milreis (currency) for the purchase and erection of a lighthouse; 1,000,000 milreis (currency) for the reconstruction of the Arsenal at Rio de Janeiro.

The President of the Republic is authorised (1) to expend up to 150,000 milreis (currency) for the erection of a technical school for apprentices in the State of São Paulo; (2) to make a grant to the municipal authorities of Federal States of 4,000 milreis (currency) per kilometre for the making of roads suitable for motor vehicle traffic; (3) to expend up to 300,000 milreis (currency) for the erection of a new Arts and Crafts College in Rio. The Government are further authorised (1) to expend up to 500,000 milreis (currency) for the rebuilding of the National Printing Office; (2) to negotiate with the Government of Uruguay for the building of frontier bridges across the rivers Jaguarao and Quarahim; and (3) to expend up to 5,000,000 milreis (currency) for building and rebuilding and repairing Customs houses and other Revenue offices.

Milreis (currency) = 1s. 4d.; Milreis (gold) = 2s. 3d.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

EAST SUSSEX HOSPITAL, HASTINGS: -
SECOND PREMIATED DESIGN, BY MESSRS. C. K. & T. C. MAYOR.
THIRD PREMIATED DESIGN, BY MESSRS. H. PERCY ADAMS & C. H. HOLDEN.

The Old Town Hall, Manchester (now the Reference Library).

THE OLD TOWN HALL, MANCHESTER.

THERE are, as yet, few indications as to whether the Manchester Art Gallery and Library, which was the object of the most important competition since that for the London County Hall was decided, will ever be erected on the old infirmary site. There are, unfortunately, dire calamities involved in the chain of events which led to the purchase of the Infirmary site by the Corporation, and the one that is now imminent, and will indeed shortly be compassed, is the destruction of the Reference Library, once the Town Hall.

It is no exaggeration to state that in losing Francis Goodwin's masterpiece Manchester will lose not only a notable historical monument of a memorable stage of its civic growth, but a priceless work of architecture. Built in 1825, it ranks as the noblest of the remarkable series of buildings in Manchester that marks that fine period of the English Renaissance, and which includes its near neighbour, Cockerell's Bank of England, and Barry's Royal Institution. In the splendid simple lines of its composition, as original in its modelling as it is scholarly in its Greek detail, the façade is a supreme example of monumental design. The fine depth of shadow of the portico throws into high relief the subtle lines of the Ionic colonnade, giving a striking rhythm of light and shade emphasised by its contrast with the severe masses of walling at the ends, and it has a wonderful dignity, notwithstanding the want of sufficient base due largely to its unfortunate position. The great hall of the interior, now that it is stripped of the bookshelves and other properties that have encumbered it

during its years of service as the Reference Library, is revealed as a reception hall of noble proportions, in which academic detail is combined with daring originality of planning such as produce an interior probably unsurpassed by more than two or three examples in the country. The boldness of the planning of the axial lines, two secondary axes at the ends crossing the main vista at right angles, takes away the obviousness of a hall with a single vista culminating at the end, whereby the whole would be comprehended at a glance, and is convincingly appropriate to its purpose as a reception hall, where one finds fresh points of almost primary interest besides the main vista down the room. The great sweep of the plain walls and the severity of the graceful shafts of the columns are sharply contrasted with the exuberant Greek treatment of the ceiling.

The sale of the building was effected several years ago, and is irrevocable. The price was the purchase-money of the Infirmary site. Its destruction is inevitable; its demolition will probably commence in a week or two. It is seemingly too late for Manchester to restore the building to its former glory, but it could do nothing that would give better reason for civic pride than to reinstate the hall and various rooms as its City Hall. Waterhouse's Gothic Town Hall, notwithstanding its brilliant plan and as great strength of design as is ever found in the work of its transitory epoch, has no suggestion in its State rooms of municipal greatness at all comparable to its predecessor, or to those in Wood's Town Hall at Liverpool, and the building is now far too small for the increasing demands upon it. The opportunity of saving the interior is gone, but it is not too late to save the façade. If the building were a crumbling mediæval wreck it would find protectors by the score, and we trust that support will not be lacking to the strenuous efforts which are being made by the Manchester Society of Architects and its President for the removal of the façade to one of the Manchester parks. Mr. Edgar Wood, in a letter to the *Manchester Guardian*, insists strongly upon the educational value of such a building, and puts forward a plea for help for its partial retainment. It is being measured by the students of the Society and the School of Architecture, under the direction of Professor Capper, with a view to the publication of the drawings as complete records of its design.

The Old Town Hall, Manchester: Interior.

THE ASSOCIATES AND THE R.I.B.A.

THE proposal to be considered at the business meeting on Monday that the Associates of the Institute should have a representation on the Council equal to that of the Fellows raises a point of great interest and of considerable importance to the future of the Institute.

We have already called attention to what is, we believe, the undoubted fact that the present abnormal state of affairs is largely due to the action of those of the Associates who, though eligible for the Fellowship, have deliberately, and as a matter of policy, refrained from taking it up.

From the point of view of the Institute as a whole it is probable that the original object of giving any representation to the Associates was to make sure that the Council should always contain an adequate number of members competent to represent the views and feelings of the coming generation, whose youthful enthusiasm and new ideas would influence the Institute in the direction of progress; but if the best known and most influential of the Associates—those most likely, therefore, to obtain seats on the Council—are in long-established practice and in years and experience more on a level with the Fellows, and more likely to take their point of view, this object appears to be defeated.

What the original constitution of t
Institute seemed to aim at, and wh
still seems required, is that the point
view of the man who has not had sev
years of practice, or who does r
practise at all, should be adequat
represented on the Council. While t
present state of affairs lasts there is
guarantee that this could be attained
increasing the representatives of
Associates, unless this increase is acco
panied by a regulation that those As
ciates who have been in practice
seven years are not eligible to repres
their class on the Council.

It is always difficult enough to asc
tain just the right amount of represen
tion that is due to the younger gene
tion in such a society as the Institu
and this difficulty is not lessened wh
the class which is supposed to repres
them no longer does so exclusively.
is a great pity that the question is
needlessly complicated in this w
What we are afraid of is that the ca
of the younger men and of those who
not practise is likely to be prejudice
it is thought that a complaint of w
of adequate representation is being
vanced by members who could imm
diately obtain it by passing on to
Fellowship. Such members, no dou
might with justice be reminded that t
cannot have it both ways, and t
if they prefer the advantages of
Associateship they must be prepared
put up with its disadvantages; but t
does not dispose of those who are
eligible.

Here we are inclined to think
anomaly exists which calls for seri
attention. Apart from the quest
whether the present representation of
Associates is sufficient under nor
conditions to obtain the desired ben
of the young man's point of view on
Council, the position of the Associate
never practises should be taken i
consideration.

Owing to the fact that the independ
practice of architecture is the
qualification for admission to the Fell
ship, there must always be a cer
number of Associates who, whether f
choice or necessity, will always ren
Associates. In this connexion it sh
be fully realised that successful prac
is not everything, and that there
able men to whom it is not the goal o
earthly ambition. A love for scholar
or research, a preference for teachin
taste for archæology, or a distaste for
commonplace business worries inse
able from everyday practice may
fluence many a sensitive and cultu
man to devote himself to the th
rather than the practice of architect
As men of means and education bec
more cognisant of its attractions
possibilities as an intellectual pursuit,
as the newer responsibilities of
practising architect continue to m
up indefinitely, this type of man ma
expected to increase. Although it
be urged that his point of view is of l
value to a society which exists to fur
the interests of practising architects,
it should have some weight wit
learned society holding a Royal ch
for the advancement of architecture
fine art. Under present conditions
most distinguished of historians

chæologists, the most learned of pro-ssors, whatever his age, is liable to find mself bracketed with the youngest and ost inexperienced member of the junior ass, and no special machinery seems exist for the purpose of securing his rvices on the Council.

Then, again, the recent growth of the ge architectural departments of such dies as the Office of Works or the ndon County Council entails the em-yment of many members in positions ich, though technically subordinate, ist no doubt be filled by men of mature ars and considerable ability and ex-rience. Their point of view and their cial interests must differ from those the junior practitioner, or from those the scholar or archæologist who does t practise; yet we find them all grouped gether in one class with a small re-sentation on the Council.

This representation appears, in the ture of things, to be sufficiently com-cated without the further complication endeavouring to provide for members ose interests and point of view are eady provided for elsewhere.

Indeed, it will be most interesting to on what grounds this claim is based—ether special attainments will ask for cial representation, equality of age and perience demand equality of represen-ion, or youth and inexperience request ther protection.

We imagine, however, that so im-rtant a proposal would not be put ward unless its proposers were pre-red to support it with serious argu-nts tending to show that it would be the interests of the whole Institute, d not merely in the interests of any e class or section of a class. Perhaps y will take the opportunity to explain y it is to the advantage of the In-tute that eligible Associates should not ce up the Fellowship, what disasters uld be caused if they did, and in at special way they can serve the titute and advance architecture better Associates than as Fellows.

Although it may not be necessary to ce this actual proposal too seriously, it does probably reflect a real ling of dissatisfaction amongst the neral body of the Associates on the ject of representation. It is a ques-n, however, whether a proper repre-tation can ever be arrived at while s class is constituted as at present, and might perhaps be more useful to try amend its constitution first and its presentation afterwards, and so en-avour to weld the Institute into a re compact and harmonious whole.

The opposition from the Associates ich the Institute has recently encoun-ed in efforts which tend to the unity the profession suggests that before ther progress can be made in this ection it would be as well to endeavour obtain that unity in its own household on which all wider unity must, we agine, be founded.

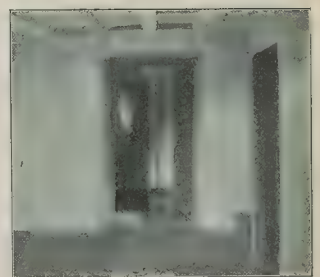
That on every question as it arises lividual members should be found to pute the wisdom of the action of the verning body is only natural, and is a matter that need cause any search-of heart, but where a distinct class members appear to discover in almost ery proposal something detrimental to their particular interests as a class it suggests a lack of proper organi-sation in the constitution of the whole body.

Class distinctions of any kind are not altogether in harmony with the spirit of the age, and the opinion seems to be gaining ground that it would be better for the Institute if they were abolished altogether and the whole of its members placed on the same footing. Unfortunately, from this point of view, the institution of a compulsory examination and the creation of a class of Licentiates have tended to emphasise such distinctions. and the Institute must perforce deal with the situation thus created.

The trouble seems to be in all societies that, although any definite proposal is usually opposed by individual members on its merits or demerits, it is generally found that when opposed by any class of the members as a class it is not so much on its merits as on its bearing on the privileges or interests of that class. It is conceivable that a proposal may be in the interests of architecture and of the profession generally, and yet be contrary to the interests of any one class of the Institute as at present constituted. It is surely a source of weakness if the Institute before taking any action in the public interest has to stop and consider just how far the somewhat conflicting interests of its different classes of members may be affected by its proposals, and then trim its sails accordingly. The suggestion inevitably presents itself that the more the interests and privileges of its members coincide, and the fewer these interests and privileges are, the easier it will be for the Institute to act in the public interest with promptitude and decision, and so carry out the intentions and discharge the obligations of its charter.

NOTES.

The Competitive System in America.



FROM an address delivered by Mr. J. Milton Dyer, F.A.I.A., before the Annual Convention of the American Institute of Architects, on the effect of competitions on design, we gather that as much improvement in the general ethics and conduct of competitions is required there as here, if they are always to exercise a beneficial influence on architectural design. It is as true here as there that "you are afraid to be impulsive, to play with the motives, to do the thing you yourself feel," because your "independence is only too often influenced by a vague mistrust as to the personal likes or dislikes of the jury," and that this does too often create the temptation to "sell one's soul to win." Both this and the complaint that the competitor cannot get into touch with his client seem to be rather defects of method than vices inherent in the nature of the competitive system. When juries and assessors learn to judge on generally accepted principles, rather than on personal predilection, the first should disappear. The second would be considerably mitigated if assessors, remembering that they are the interpreters of the wishes of the promoters, would acquire all such general information on the whole situation—beyond the bare facts of the case—and on the ultimate intentions and point of view of the promoters, as they would themselves acquire from their own clients if called upon to design a similar building. If this was incorporated in the conditions by way of information only, the competitors would not feel quite so much in the dark. Even more perhaps in this country than in America do "the efforts of all in collaboration, working in an office upon a serious competition, develop not only draughtsmanship, but a real conception of architecture in its higher meaning, such as many months of routine work may not accomplish," for here there are fewer educational opportunities than appear to obtain in America for the study of large architectural schemes. It is hardly to be disputed that in this respect the competitive system has had a beneficial influence here, although we are not perhaps altogether free from the tyranny of the order which Mr. Dyer considers so undesirable a result of this system in America.

An Isolation "Hospital."

No. 61 (New Series) of those valuable Reports to the Local Government Board on Public Health and Medical

Side View of a "Hospital."

A View of the Interior of the "Hospital."

"Although at the time the photograph was taken there had been no rain for a month, water stands several inches deep on the floor of the back room seen through the doorway. There is no furniture."

Subjects deals with the prevalence of acute poliomyelitis in Devonshire and Cornwall in 1911, and, while the greater part of the Report is devoted to medical consideration, there are occasional references to matters of more general interest. In one district it appears that the Clerk of the authority, in order to allay public anxiety, claimed that hospital provision was available, and in a letter to the local Press made the statement :—"There is an isolation hospital at . . . ." The Report contains four photographs of this "hospital" taken a few days after the Clerk's letter was published, and we reproduce two of them. As the Report states, they show without need of written description, the character of the hospital accommodation provided.

Vacation Courses, Sheffield University. SOON after the formation of the Department of Architecture at the University of Sheffield it was considered advisable to organise Vacation Courses at places in which buildings of architectural importance could be studied by means of the making of sketches and measured drawings, and to make attendance at a certain number of these courses compulsory for students working for the Diploma in Architecture awarded by the University. As this is, we believe, a new departure, it may be useful to give some particulars of the courses. The Easter course generally begins about the end of March, and lasts from a week to ten days, while the summer course begins about July 8, and lasts from three weeks to a month. The advantages of these courses are that permission to sketch and measure a series of important buildings is obtained, all difficulties as to the use and hire of ladders, etc., are avoided, and that an instructor is present with the students to give such advice and guidance as may be needed. Up to the present only local students have been admitted to the courses, but it is thought that they may be of value to other students of architecture, while students other than those attending the University can join. The students make their own arrangements with regard to rooms and board, but particulars of suitable accommodation are supplied to them. Easter courses have already been held in Lincoln and Stamford, and summer courses in Oxford, Cambridge, and London. The Easter course will be held in Bath this year, commencing on March 23, and permission to sketch or measure at several important buildings has already been obtained, and at the beginning of the course a lecture on the architecture of Bath will be given by Mr. Mowbray A. Green, F.R.I.B.A. For the summer course, 1912, a sketching and measuring tour in Northamptonshire will probably be arranged. The experience of members of the London Architectural Association who have taken part in the summer excursion of the Association and in other visits is evidence of the useful work accomplished at such times, and, though the compulsory character of the Sheffield outings constitutes a difference, we have no doubt the work carried on will be just as valuable and interesting to those students who take part.

Mr. F. R. Yerbury, Secretary to the Architectural Association.

The Secretary of the A.A. THE appointment of Mr. F. R. Yerbury as Secretary of the Architectural Association in succession to the late Mr. Driver should have the hearty support of all members of the Association. Mr. Yerbury has been acting Secretary since the office became vacant, and the successful manner in which the work has been carried out during that time was to be expected from one who was associated with the late Secretary for so many years, and who has grasped and applied the successful methods of the late Secretary. We congratulate both Mr. Yerbury and the Association upon the appointment.

PARLIAMENT BUILDINGS, WELLINGTON, N.Z.

With the issue of the New Zealand journal *Progress* for December last is given as a supplement a selection of the designs submitted in the competition for the proposed Parliament Buildings, Wellington, New Zealand, including the first, second, third, and fourth prize designs. The supplement is admirably got up, and the various designs can be conveniently studied. The supplement includes the conditions of competition, etc.

THE LATE MR. CHRISTIAN SYMONS.

An exhibition was opened recently at the Goupil Gallery, Regent-street, of the work of the late W. Christian Symons, who designed the mosaics in the Chapel of the Holy Souls, Westminster Cathedral, and the great rood which hangs from the roof. This decorative work has been praised by Mr. John S. Sargent, R.A., among other artists, and Mr. Robert Ross writes that "Bentley's masterpiece could hardly have been adorned by a more sympathetic and more appropriately chosen craftsman." Mr. Symons also designed some spandrel decorations at St. Botolph's, Bishopsgate. His work in the exhibition consists chiefly of easel pictures in oil and water-colour.

COMBINED ORDINARY GENERAL / CAMERA, SKETCH, AND DEB CLUB MEETING.

A MEETING of the Architectural Associ was held on Monday, at No. 18, Tufton-s Westminster, S.W., Mr. W. Curtis Green, President, in the chair.

Mr. Hall, Hon. Secretary, announced the next meeting of the Camera Sketch Debate Club will be held on Thursday, Marc when a paper by Mr. Alan Snow, en "Neo-Grec" will be read. He also annou that the Annual Smoking Concert and Re the A.A. Athletic Club will be held on Mar at the Pillar Hall, Victoria Station Restau

Messrs. J. Burford (London) and C. E. (Palmer's Green) were elected as members.

It was announced that a Special General ing will be held on Monday, March 11, to By-law No. 36. (It is proposed that the b shall read:—"The office of Hon. Secretary not be held for more than two sessions togeth

The Chairman proposed a vote of th to Mr. J. J. Burnet for kindly allowing me to visit the British Museum Extensio

ruary 17, and to Mr. Theodore Fyfe for luncting the party over the buildings; also Ir. W. E. Blake for his kindness in providing upon the occasion.

e also proposed a vote of thanks to Mrs. ur Cates for kindly presenting a large ber of photographs to the Association.

he motions were agreed to.

New Secretary.

he Chairman said he had much pleasure in ouncing that Mr. F. R. Yerbury had been ointed Secretary of the Association. Mr. bury had been doing the work of Secretary of Association for the last three months, and would all be glad that he had been elected hat position.

he announcement was received with applause.

HOPES AND FEARS FOR ARCHITECTURE.

r. F. C. Eden then read a paper, entitled opes and Fears for Architecture." He :—

As one glances over the history of Eng- architecture during the past century the ight intrudes with disturbing iteration s the Mistress Art, she of the mien serene dignified deportment, shares to the full weakness of her sex, and has an eye as n as the most frivolous of her sisters the latest fashion, especially when it es from Paris.

arly in the century the Greek revival ch had been suggested by Stuart and ett's great work, and vivified by the ortation of the Elgin marbles, attracted ts rather dreary refinements such men as ood, Smirke, Elmes, and Cockerell, to be ently thrust aside by the careful, if un- ired, Italian manner which we associate n the name of Barry. Meanwhile, a more arkable movement was gaining strength, tely, the Gothic revival, with Pugin for ophant and Ruskin for its prophet. ugh these enthusiasts deemed its founda- s to be upon the holy hills of truth, nal and immutable, the Gothic phase ved to be as temporary as any edifice ed with hands. Weakened by the strain upon it by such essays in the ungainly Eaton Hall and Keble College, the crush- weight of Street's Law Courts brought ut the slow collapse of the movement, and ugh the opening cracks was heard the ll voice of Sedding crying for originality any price. The votaries of the cult dually dwindled to a little flock, and ugh some stray worshipper may still offer nse at the deserted shrine, the embers the altar are well-nigh spent, if they e not utterly extinguished by the death Bodley, truly the last, as the most ured, of the Goths.

Arts and Crafts Movement.

he reaction against mediæval copyism, what was intended for such, set in with e violence; fretful versions of "Queen ne," free (and easy) or ungrammatical sic; Dutch and Flemish motives all their little day. Soon we began to hear workman whispered of as a "craftsman" ng a certain coterie, whose esoteric doc- e seems to have been this: that you have to leave the workman, chisel in hand, to face with a lump of material, and ething beautiful will come into existence; other words, the inspired being will be to "express himself." And so, not out some British mingling of sense and , the arts and crafts movement was ched. The professional architect became bugbear of some. "Burn your books," their cry; but the eminent author of *mot* goes on writing all the same. The tsman then it was who was to redeem the ; though how he was to do so without his ent backing of tradition and hereditary is not even yet apparent. More closely ed to this movement than some of its porters might care to acknowledge is the Art, now quite discredited—in this try at least, though its pet motives still rive in trade catalogues and on purely mercial wares. A small vogue, hardly to called a fashion, was once started in our of the Byzantine manner by a build- not far from here (much as Sedding's ch in Sloane-street bred a weedy crop of ative west fronts, or Scotland-yard an epidemic of obelisk-crowned gables), but I do not fancy it ever came to much.

All this time the grand manner of domestic building had been forgotten; picturesqueness was everywhere attempted, and misunderstood to consist of jagged skylines and jumbled incompatibles. There was a sort of affectation of rusticity, like the bastard simple life of the present, which may be suitably described as the cottage heresy.

In the next stage the hidden stirring of some classic impulse moved the professors of this nook and corner style to prune, chasten, and square up their designs. Sobriety began to rule; but not even yet is the restless Goddess of Fashion appeased.

Artistic Salvation.

People are still wondering whether our artistic salvation is to come from the East or from the West, or yet from the South. Is it to be Byzantine, Georgian, or neo-Grec? Will it come from the land of the skyscraper, or from the Ecole des Beaux-Arts and the Petit Palais? Observation shows that the conditions are still of a very unsettled character. So down drops the vacillating mercury once more, and mutterings of a second Greek revival threaten further disturbance of the architectural atmosphere, already charged with electricity from across the Channel.

"Except the blind forces of nature nothing moves in this world that is not Greek in its origin," and so, I suppose, we must anticipate that periodical Attic depressions will reach these shores. We are not, then, altogether surprised to notice how large a proportion of the designs submitted in recent competitions are rather bleak and toneless efforts in the sort of Greek that is learnt by looking over a Frenchman's shoulder. Whatever excellencies they may possess in planning and so forth, it must be admitted that they leave us cold. But of all fashions in art Paris fashions are now for us the most pernicious. Just as in literature each language has its individual genius and rhythm, so in art. Gallic idioms are not ours, Gallic excellencies quite other. Consider the influence of French ideas upon the current manner of design as displayed in recent buildings and competitions. I do not know how to describe it except as a kind of architectural "cubism." The dominant *motif* is the block. We watch it standing uneasily on cornices, hanging from sills, stepped, imposed, superimposed, *appliqué* to the wall face; tight wreaths of laurel and myrtle clasp and interpenetrate it, *guttæ* weep from it—there is no designing without tears now for the young architect—while scraps of columns, mouldings, or carving emerge with Rodinesque inconsequence from ponderous chunks of masoned stone.

Are we to account for the incessant change which the last hundred years have witnessed as a stirring of vigorous life or as a restless craving for some new thing, a fashionable acquiescence in the unimportance of being earnest about anything for long; as the gushing of a perpetual fount of fresh ideas, or as mere idle floating with the stream, a feat, as we have been reminded, which any dead dog can perform? Is it inspiration or decay, the waving of a banner or the flapping of a shroud?

Seeing that all great accomplishment in the past has come from working steadily along a simple line of age-long tradition, it cannot be seriously maintained that such rapidly changing fashions are beneficial to art. Nevertheless, almost every passing phase has left some good behind it.

The Gothic Revival.

For example, there is still something to be learnt from the Gothic revival. The lesson is, I think, twofold. Firstly, enthusiasm. The writings of Pugin, Street, and others brim over with it. Such books as "Brick and Marble in Italy," or Webb's "Continental Ecclesiology," are most refreshing reading for this very reason. However much we may smile at some of its manifestations of zeal we may well sigh for a share of that contagious spirit. And, secondly, definite principles, without which enthusiasm runs to seed. The chief apostles of the movement—Pugin, Morris, and pre-eminently Ruskin—made an earnest attempt to decipher and codify the laws of artistic conduct. Ought I to apologise for mentioning the author of the "Seven Lamps"? If it has been the custom of the prigs of a past generation to swear by Ruskin, it is the custom of their successors to swear at him. Even a serious writer like Mr. Blomfield cannot resist a kick at the dying lion, as "most intolerant and uncritical of amateurs." Perhaps to the modern mind any forcible exponent of definite opinions is bigoted and intolerant, and one suspects that the most popular teacher of to-day would be a professor of hypothetics, a sort of dealer in honest doubt. Still, if the principles enunciated by these "intolerant amateurs" were universal and sound, I am not concerned to deny that a certain falseness and partiality in their application has run back like a taint and corrupted the source; with the result that now there is little recognition of any fixed laws or æsthetic standard. The followers of art have become an undisciplined mob, with a mob's capricious temper, and the practice of art has become a riot or eclecticism and experiment. The rules and precedents which are the police of art are discredited and powerless, and the artistic hooligan remains master of the situation.

Again, it was the arts and crafts movement which emphasised the importance of a more intimate relationship between material, workmanship, and design; and though the doctrine is sometimes pushed to the point of absurdity, its influence has already been considerable and in the main wholesome.

An Age of Connoisseurship.

The present is an age of connoisseurship. The collector is abroad. He is as the sand which is by the seashore for multitude, and the Jew flourishes in the land. We have omnivorous collectors and collectors who specialise in all things curious and antique, from Chinese ridge-tiles to old stay-bones. Nor are people content to fill their houses with old furniture and bric-à-brac. If reluctantly compelled to build they fit up old panelling, chimneypieces, and other fixtures in their new homes. Old vases, figures, sundials, and worn-out paving-stones grace their freshly-laid-out gardens and terraces. Pavements are laid and walls built to give hold to vegetable growths, and sprayed to encourage lichen and mosses symptomatic of hoary antiquity. Oak is greyed with lime and sandblasted to give it texture, marble is stained, gilding and paint are toned and glazed to obtain the effect of age. The same effect is sought by reversion to materials and methods that were used of old time. The materials selected are such as weather well and soon lose their rawness and novelty. Bricks are rough and small, joints are wide and white, and pointing is eschewed; timber is wrought with the adze and peppered with protruding pins; stone is roughly tooled and so left; wall plastering is finished with an undulating surface; roofs are laid in gently sweeping curves and of second-hand tiles, if such may conveniently be got.

Some may be inclined to divide these methods of treatment into legitimate and otherwise. The use of the adze, for example, though somewhat of an affected archaism, may be tolerated; while the sandblast is a fraud and a fake. The whole tendency will be condemned by others as unwholesome, decadent, and dilettante. But if the surface produced upon timber by the sandblast be artificial, is it one whit more so than that produced by the circular saw or the planing machine? And if greying with lime be illegitimate, what about yellowing with boiled oil? And, finally, if it be a fraud to make new buildings look old, how shall we characterise the really successful attempts of many architects to make old buildings look new?

Education of the Public.

The question of the education of the architect is ever with us, but what is really pressing is the education of the general public. However scholarly and efficient as a body architects may be, they are powerless until the outside world becomes interested and appreciative. If not exactly fish out of water they resemble fishes in this, that they always have to swim with their heads against the stream. However, there is little doubt that among educated people the knowledge of architecture has made enormous strides during the past thirty years, and I think that for this advance connoisseurship or the

collecting mania is largely responsible. It does breed in its victims a feeling for form, an appreciation of good workmanship, and it creates a standard. In other words, it educates popular taste.

XVIIIth-Century Art.

It would seem to be partly the cause and partly the effect of the present popularity of XVIIIth-century art, which is, at first sight, so strange and unaccountable. What is there in its refinement, repose, and freedom from advertisement, its coldness and aloofness and well-bred restraint to appeal to a bustling and commercial age? For art does not go by contraries. It is an expression of contemporary life. The haphazard, unrelated, and individualistic dwellings of the Victorian era, for example, reflect clearly enough the industrial expansion of the time and consequent emergence of the middle classes. They are eloquent of newly fledged and inarticulate ambitions, of that self-assertiveness and carelessness of treading on another's toes so characteristic of the race of men who have started in life with the proverbial shilling.

The author of a recent article on "The Aristocratic Influence in Art" notes with surprise that this cult of Georgian art is "accompanied by no sign of interest in the human significance of the style. It never seems to be imagined by its votaries that XVIIIth-century art, coherent and consistent as it is in all its details, stands for a certain definite philosophy of life. Not a trace does it exhibit of the superabundant vitality and warmth of popular art, but rather inclines to a certain coldness and arrogance of expression, its very perfection of taste lending it an air of exclusiveness, as a thing aloof from common appreciation. It is its aristocratic purpose or tendency which constitutes its note as a style," and is an accurate reflection of the aristocratic ascendancy which began with the overthrow of the autocracy of the Monarch in 1688, and lasted until the Reform Bill. The author goes on to suggest that the coming democratic ascendancy will be registered in art in the same way, and concludes that "the air is full of promise. Beneath modern connoisseurship, itself the inevitable legacy of the aristocratic epoch, a healthier and stronger movement is fermenting. It is from the workshops of England that the rescuers of our art are coming. In the modern democratic advance lies the best hope for art." This reads like an echo of the old arts and crafts movement, but there is room for serious doubt whether great art can be born or thrive under a democracy. Athens was to all intents and purposes an oligarchy, so was Venice. What has Switzerland done for art? And she alone among democratic States has had time to show her capabilities.

Still, if there be ground for this hope, if the democratic advance be reddening the horizon, surely our public architecture should catch some reflection of the coming dawn. To take certain buildings of importance and representative of diverse activities—the Victoria and Albert Museum and the Birkbeck Bank—are these aristocratic or democratic? I cannot tell. Then what of the Ecclesiastical Commissioners' offices and the Imperial Hotel? Of the Wesleyan Hall and Harrod's Stores? Are these "the inevitable legacy of the aristocratic epoch," or signs that a "healthier and stronger movement is fermenting," and that it is "from the workshops of England that the rescuers of our art are coming"? Again I cannot tell.

Art of the Jerry-Builder.

But of this I am convinced, that we have a form of architecture which is pure vernacular, racy of the soil, straight from the "great heart of the People." It is built with entire and obvious singleness of aim, without affectation or conscious striving after beauty, and of the materials that are easiest to be got. The professional architect, that bogey of a certain school of critics, has no part nor lot in it. It comes as direct from the workshop as anything possibly could do. I allude to the architecture of the typical suburb, of the artizans' quarter, of the speculator, in other words, the art of the jerry-builder. Perhaps this is where the true hope for architecture lies. Who can tell?

Style and New Material.

The main purpose of all mechanical inventions, from the printing press onwards, has been not that things may be better done, but that they may be more quickly done. The ideal of speed has supplanted the ideal of efficiency. This, I suppose, is the chief recommendation of reinforced concrete as a building material. For instance, we are told that in the United States of America a wall 200 ft. long and three storeys high can be made in a single day, with all its architectural trimmings of buttresses, pilasters, pediments, and what-not complete; and that after forty-eight hours it is sufficiently set to be elevated into position. In the same way a simple four-walled building can be cast in four pieces, which are then raised on jacks, and put together like a box, ready for the lid to go on. This is quite legitimate evolution of monolithic construction; and if the method does not commend itself to us it must be owing to our English distaste for pushing principles to their logical conclusion. After all, a genuine timber-framed house is erected in just the same way, each wall being put together on the ground and then hoisted into place.

What concerns us here is the influence for good or ill which this new method of construction is likely to exercise upon the art of architecture. Attempts have been made abroad if not at home to originate a style peculiar to a new and untried material. We are to use it in the most direct way possible, with entire truth to its qualities of thinness, toughness, and so forth. A monolithic building should achieve such expression as it is capable of without imitation of other materials or reminiscence of other methods of construction. Let it confess itself for what it is without concealment and without shame. This is the way, we are told, to achieve character; beauty may come later. *Ex forti dulcedo*—out of the strong will come forth sweetness.

But whatever the material we are using the natural conditions of gravity, weather and light, remain unchanged; and our endeavours to meet these conditions cannot be expressed in ways wholly different from those of the past. We are not in a state of architectural innocence; the fruit of the tree of knowledge has been tasted; and sooner or later we are forced to cover our nakedness with the usual paraphernalia of the architect's wardrobe.

Some, again, are sorely puzzled over the proper treatment of the wall face. One will employ acid to dissolve the matrix and expose the aggregate, another will tap the surface to remove the aggregate and emphasise the matrix. A third, following a counsel of despair, cloaks his skeleton with stone, brick, or faience, which does not seem a great advance upon the Tower Bridge type.

Ferro-Concrete.

To the man whose tastes are calculating and scientific ferro-concrete makes an irresistible appeal; whereas, in the view of the *laudator temporis acti*, an ounce of tradition, that is to say, experience methodised by the knowledge that comes with centuries of practice, will always outweigh a ton of professional theorising. Though, I daresay, he will be glad enough to use it on occasion, however shamefacedly, to help a lame dog over a style or cut some Gordian knot of construction.

If one were concerned to deprecate its use for general building purposes as likely to retard genuine architectural advance he would, I suppose, do so on some such grounds as these. Firstly, that by its use it is quite possible to erect buildings of monumental scale with walls of startling thinness. But if we are to enjoy beauty in a building there must be restfulness; and to be restful it must appear stable. All supports must satisfy the eye as to their adequacy as well as the intellect. It may be thought that this is all matter of association; in time the eye will accustom itself to lightness of effect. There is some truth in this, and no doubt those whose days were spent under the old roof of Charing Cross Station felt no misgivings as to its stability. But familiarity is not all. The reason why steel, whether embedded or not, can never be æsthetically satisfactory as a weight-carrier seems to be partly that it is not a na but an artificial product (we do not fi in nature resisting strains and stresse does the growing timber of the forest tr the rocky vault of the cave), and partly all fine architecture is generous of materials. It is never content with a mum of solidity or a bare margin of strea It has been left to the engineer and speculating builder to work that out in several lines.

In the next place he would urge th greatly increased use of reinforced con would have a disastrous effect upon portion as we have learnt it from the monuments of the past. And until they disappeared from the face of the earth standard remains fixed, quite apart from Vitruvian rules or mathematical ratios.

Lastly, it is in reality a method of d tive construction quite independently any outer casing. To the eye a beam c inforced concrete differs in no way fr beam without such reinforcement. again, no doubt our critic would be met the reply that so far as proportion deception are concerned it is all a m of education of the eye. When that become habituated to the new metho building his objection will cease to hav force. Be that as it may, I am dispos agree with him that it will never prod Mont S. Michel or a Caprarola, wha may be its adaptability to modern need

The Shop-Front and Block of Flats

Just as the church and the castle ma taken as typical mediæval aspirations we may safely select as the building representative of the spirit of this indu age the shop-front. It has been dinned us from our architectural cradles as a axiom of criticism that every edifice mu expressive of its purpose and use. the requirements of an up-to-date may be an up-to-date shopkeeper be trusted to know. In the din rattle of commercial activity it is d less necessary to yell like a virago on a step in order to be heard; and so the man declares for the largest possible of glass for the advertisement of his w and threatens the building owner wit appreciably lowered rental for every pos pier beyond the engineer's minimum.

What, then, is to happen when the c tions imposed are vulgar, sordid, or worthy? Simply this, if the axiom stated is to hold good the architecture have to follow suit; and then the stra result ensues. To save his art from wreck the skilled architect throws overb its first principles, and his design becom inexpressive or lying mask. But such ditions do not hamper the careless titioner. He complies with them will enough, and so his work is actually characteristic and expressive than th his conscientious brother. Look at American "store" in Oxford-street. A design, but surely not a shop! It h the appearance of a great building upon evil days and converted from nobler use into a drapery establishmer do not blame the architect for the decey I commend him. The vision of atlantic hustle expressed in terms of tectural permanence would, I think, one awake o' nights.

Or we may consider another class of ing common enough in large towns—the of flats, or the oddly-named "model lings." Here conditions which imply s storeys of approximately equal height, divided into suites of small rooms, pr of necessity frontages in which the pr tion of solids to voids is much the sa in a sieve. Add to this the necessi building cheaply enough to show a percentage upon capital invested, and you whether architecture so conditione be monumental.

But it is possible to take a rosier "The true artist," it is said, "m tatingly accepts the conditions imposed him, whatever they may be, and is ofter to turn the stumbling-block in his path a stepping-stone to higher things." I in this spirit that a lecturer not long twitted architects with overmuch clingi the past. He maintained with spirit

architecture must be living, and in order to live must find its poetry in the life and its inspiration in the opportunities of the present; and surely never were opportunities so many, so splendid, or so various as now. To make his meaning clear he was obliging enough to enumerate some of the occasions upon which the divine *afflatus* may be trusted to inspire the erection of poems in (I suppose) ferro-concrete. Are we not building every day, he cried, hotels, railway-stations, asylums, baths and washhouses, and abattoirs?

Town Planning.

And now what of town planning, that ancient fad of doctrinaire and tyrant, whether monarchial or democratic? For Nebuchadnezzar had his views upon the subject no less than Mr. John Burns. Is the movement which has by this time gained considerable momentum likely to communicate any forward impetus to your art?

The cottage heresy, to which I alluded just now, is indicative of a sickness which has long afflicted British architecture, and that is pettiness. By this I mean not only the material malady, timidity of scale—so noticeable in our larger buildings—but the more serious spiritual disorder, smallness of idea.

Have we any ground for hope, based on the experiments at Port Sunlight, Letchworth, Golder's Green, and Gidea Park, that when the designer has to think in acres instead of poles and in streets and squares instead of single houses his ideas will be braced to a larger scope, or will they peter out in a mere multiplication of diminutive and unrelated units?

In all spheres of activity the age is one of small men and myopic vision. When the poor millionaire can conceive of no larger, nobler employment for his own wealth than providing greasy novels for idle people to thumb, how can we expect bigger things of those corporate bodies who have the spending of other people's money? Schemes whose greatness is to be measured in ideas rather than acreage have been carried out under the grinding tyranny of a despot, never, so far as I know, under the axe-grinding tyranny of a municipality.

Still, in so far as it may tend to promote orderliness and grandeur of conception the movement is all to the good. But in appraising its value it should be remembered that the congestion which the recent Act attempts to relieve is, after all, only a symptom. The real disease is the monstrous overgrowth of modern towns. Check that by legislation if you can; all else is merely palliative.

But housing reform and the planning of lately towns with grandiose approaches to public buildings centrally placed are, of course, entirely distinct problems, since it is not the poor who will inhabit these pompous avenues. The latter, if a less pressing need, naturally affords greater scope for architecture. At the same time there is a certain unpleasant kind of artificiality about the town that is consciously planned. The normal town is not planned, but grows, and that with an unmechanical, quasi-organic growth. Certainly we have no need to imitate this in our drawing-board schemes, but I think the town planner should note that if there be one unvarying æsthetic principle which the town that has grown with the centuries—the natural town, if I may so call it—teaches it is this: the narrower the street the taller the houses, and, conversely, the wider the street the lower, relatively, do the houses become. Whatever extraneous causes may be adduced, as, for instance, value of land, cramped sites on hilltops, mutual protection, and so forth, the law that is excellent proportion is possible between lofty buildings and wide streets is incontrovertible; and it is no less true that the effect of a narrow lane bordered by two-storied tenements is one of typical squalor and meanness.

In a recent work on town planning the author shows that he does suspect the existence of this law, and feels rather uneasy in consequence, if one may judge by the haste with which he hustles it out of sight as an unwelcome intruder.

For, of course, modern notions of hygiene and traffic facilities incline to the spacious boulevard—icy and wind-swept in winter, dusty and scorching in summer, and wide enough to enable the greatest possible number of steam-lorries to rattle your windows and jar your nerves in the shortest possible time.

But where, I ask, is the lover of good things wont to linger in his search for beauty and historic interest? Among the straight, unhaunted streets of Mannheim, Karlsruhe, and Turin, or among the memories and surprises of Toledo, Siena, and Bruges? And as to what constitutes the ideal town, some of us may be inclined to think that the opinions of the painter and the poet are at least as valuable as those of the inspector of nuisances and the sewage farmer.

Traditional Treatment of Material.

When all deductions have been made for the evils to which architecture has to submit in following the dictates of fashion or in compliance with requirements of ever-increasing complexity and uselessness, we may, I think, claim to have made real progress in one, and that a most important, particular, since it covers nearly the whole ground—namely, sympathetic and, as far as possible, traditional treatment of material, involving as it does both texture and colour. We have realised that architectural, like other beauty, is only skin-deep.

Though the spectre of a contaminated and underbred Gothic still haunts the purlieus of Westminster, it is now generally admitted that in this style of all others traditional methods of workmanship and construction are, strictly speaking, essential, and that where they are neglected the bedizening of buildings with the mediæval stock-in trade is perverse and futile.

It is also matter for congratulation that in recent work we seldom meet with those combinations of red granite, red Mansfield stone, and red brickwork black pointed which were at one time in such high favour. Nor do we any longer hold that the collocation of varnished pitch-pine with yellow faïence makes an agreeable scheme of interior decoration.

Such examples are, of course, only typical, but these and all other improvements in taste and feeling have been brought to pass not by the invention of new materials and methods, but by increased knowledge of the past. The further we are enabled to enter into that rich heritage the clearer will it become to us that "in its contact with the ages the wisdom of the ancients has come down to us absolutely unimpaired."

Mr. E. P. Warren,

in proposing a vote of thanks, said the paper was a most entertaining and suggestive one, but destructive rather than constructive, and the fears predominated over the hopes. While Mr. Eden was inclined to be pessimistic, he (the speaker) had hope in many directions. He wished to protest against coupling Keble College with Eaton Hall as "essays in the ungainly." The proportions at Keble were fine, the chapel splendid, and much of the detail admirably designed, though hard in execution. It was un-Oxonian and inappropriate where it is, but in comparison with the Parks Museum facing it it was superb. Sedding, with his quick-witted charm and rather unscrupulous flitting from form to form in search of originality, prompted restlessness, and begot an evanescent unscholarly school which drifted along to inevitable reaction. The earlier Gothic devotees had a kind of scholarship, and they had that great and wholesome driving force of absolute conviction which is what most of us lack nowadays. Butterfield, Bodley, Street, and Pearson all had conviction and all had personal force and personal vision—real enthusiasm and an unhesitating sense of the vital importance of their Gothic presentments: a faith that moves mountains. That faith had waned, and as yet there was nothing so strong to take its place. After a short dalliance with the wriggly abominations of New Art, we had, at any rate, steadied down to a saner and more educated view of the meaning of architecture. There is, and probably there always will be, a tendency amongst men lacking in imagination, or of little originality—*i.e.*, the majority in any walk of life—to borrow fashions, and our French neighbours, who were convinced, direct and purposeful, were in the ascendant here. This had its benefits and its dangers—benefits in the lesson in proportionate refinement that the best French work can teach; dangers in the unsuitability of a manner alien to the climate, the character and the needs of this country, and further danger in the half understanding, the half assimilating of foreign ideals. Foreign work needed translation to the native vernacular to be successful here. If we must borrow we should at least translate, as we cannot well supply any form of architectural inverted commas to suggest a mere quotation. Men of strong bent, of fervid imagination—men, in short, of character—could follow, like Inigo Jones and Wren, foreign ideas and forms and express themselves still with native vigour therein. To genius all was possible, and genius could take care of itself. We had to consider the average run of the mildly talented, for whom the architectural outlook was difficult, if not obscured. It seemed to him that safety was only to be found in a steady purpose to make all architectural design subserve its appointed ends, and express its individual meaning, and to cast aside all forms that did not manifestly contribute to or emphasise construction. There was no need to ignore tradition or the comelinesses and pleasantnesses of ancient acceptations. The point was to understand, without which appreciation or sensible application of accepted form was impossible. And to this end patient, enthusiastic study, and careful education were necessary. Honest constructive training and refined schooling in expression would help the architectural students to avoid the many pitfalls presented by the facilities of modern methods, the steel and ferro-concrete aids to constructive disabilities. He believed there was hope, and strong hope, in the steadily growing consensus of architectural opinion. He saw every day and everywhere better, plainer, and more reasonable building and less ornament. Even jerry-builders were building a bit plainer and more reasonably. There was a lot of leeway to make up, but it was to the rising generation, who were to push us from our stools, that we must look for greater sanity, more earnestness, and less nonsense.

Mr. H. H. Statham,

in seconding the vote of thanks, said he repudiated the idea that architectural beauty was only skin-deep. The curse of the day was the desire to do everything in a hurry; buildings were run up as fast as possible in order to make them pay money, and he did not know how we were to get good architecture or good buildings if it was done in a hurry. As to shop fronts, he thought shopkeepers were learning something, and that they were beginning to find that an architectural shop front might pay in the long run. As to cottage architecture, what had struck him in visiting the new garden cities was the foolish attempt to imitate the picturesque of another generation. There was no need to build high-pitched roofs now, especially as there was the possibility of building these roofs in concrete. Another weakness was the putting of small windows in these houses; they looked very pretty, but people want light. He was inclined to think that there was rather an effort to come round again to tradition in architecture, and it was by giving due weight to the finest traditions of the past that one should be able to do something equally good in the future.

Mr. Arthur Keen

said they had heard Mr. Eden's fears, but very little of his hopes. Mr. Eden was not quite fair to the present Georgian revival. It was justified because it was really appreciated by the clients. He was afraid we should not settle down to anything approaching a national style in view of the social changes and developments going on at a faster rate than of old. It seemed to him that the democratic movement would lead to an actively socialistic world, and architecture would become very much officialised, and nothing would be satisfactory which was not academic and formal and scholarly. The hope for architecture in the future lay in training students on those lines, instructing them in the principles which tend to fine architectural conception; teaching to understand the value of mass and proportion, light and shade, and the big characteristics of sound architecture. If students had a proper idea of that it would not matter what developments occur or what style they

expressed themselves in—we should get fine architecture of its kind.

Mr. A. E. Richardson

said Mr. Eden should not have taken such a pessimistic view of things, but should have coupled architecture with hope. The paper struck him as a confession of indecision. If Mr. Eden showed any predilection or sympathy for any particular form of architecture, it was on the Gothic and not the Classic side. Mr. Eden confessed himself as being hopelessly bewildered by the number of past styles; surely a way should have been shown out of the maze. In reviewing the present trend of architecture Mr. Eden should have considered more thoroughly the modern problems which architects have to meet. He (the speaker) thought architectural design might be divided into three main groups:—(1) The monumental manner—civic and city buildings; (2) the suburban manner, which without apeing the city architecture, should be a reflex of its truths; and (3) the grand domestic manner and the avoidance of prettiness. This division was well illustrated in the development of the country town. The centre of the town was given up to the Town Hall and the leading offices; then follow the various important shops, the town houses of the foremost townspeople, the semi-country houses of the well-to-do who live on the outskirts of the town, and, finally, the isolated country house two or three miles outside its boundaries. The hope of modern architecture lay in the furtherance of a cosmopolitan style. Insular prejudices must be forgotten and a broader view taken of the changed conditions of life. To isolate ourselves from the main movements now taking place all over the world was a policy of suicide.

Mr. V. T. Hodgson said he thought the paper was really a hopeful one.

Mr. Alan Potter

said we need have little fear for our domestic, collegiate, and ecclesiastical architecture, they were the outcome of tradition; but there was room for fear in regard to our city architecture, for which there was a lack of sound tradition to build upon. Added to this we knew superficially too much about the past and thought too little about the present. All ancient architecture was the outcome of centuries of work, and was always the development of the modern architecture of the time. There was a constant attempt to improve on the last building erected, and this was the chief lesson to be learned from history. We should build up a tradition in regard to our city architecture in the way the ancients built up their traditions, gradually eliminating those formulæ of ornament, the so-called "Orders," bequeathed to us by our Renaissance ancestors, and finally evolve an order or an arrangement of architectural features suited to our modern problems of large window spaces and large floor areas. The hope for the future of city architecture lay along these lines.

Mr. Cecil C. Brewer

said there was not a single hope in the paper. This was an age of competition, and what was that doing for us? It was making men think about planning and give up thinking about elevation. It was training a school of skilful and rapid planners and producing in many cases extraordinarily fine plans. There was hope in that our men were being scientifically trained as planners and were forgetting a little about elevation.

The Chairman,

in putting the vote of thanks to the meeting, said he always listened to what a man had to say with one eye on his work. Mr. Eden was one of the few men we have ahead of his time. The paper they had heard separated the artist from the Philistine without the latter being aware of it. It was a paper full of golden silence; the reticence of the good craftsman. If he was right, Mr. Eden regarded any recent improvement in our architecture as due to our increased knowledge of and respect for the past. That past was our too-unstudied heritage. We were, in fact, heirs to the æsthetic view and also to the organic view; and we were gifted with ordinary human intelligence in the ordering and use of our inheritance. He detected in Mr. Eden's view three hopes for the future:—(1) Tradition; (2) enthusiasm; (3) definite principles. The first stood for hereditary skill—the gift of the age of thought, typical of the Classic spirit; that was to say, the love of definition, intellectual spaciousness, the search for finite perfection. The second, enthusiasm—the gift of the age of action, typical of the Middle Ages, the magical and mystical element, the search for the infinite. The third hope was in definite principles, the result of all that had gone to produce the present; the two former ages added together giving us the freedom of both views, the æsthetic and the organic. They gave us the power that was to stamp our work with style, to resolve apparently complex problems into their component parts, and to produce architecture as the result. We have before us two types; on the one hand, the architect who within certain well-defined lines always achieves architecture of one type. And on the other, the man who did well with each call upon him, because he had learned to use all his faculties of thought and selection.

The motion having been heartily agreed to,

Mr. Eden,

in reply, said he was not quite as pessimistic as some of his critics appeared to think: possibly the hopes could be read between the lines. In reply to Mr. Warren, his personal opinion was that the colour, proportions, etc., of Keble College were wrong. As to architectural beauty being only skin-deep, he thought that was as true of architecture as of human beings. He did not know where St. Mark's would be without its skin.

The next meeting will be held on March 11. A paper will be read by Mr. C. A. Daubney, F.S.I., A.R.I.B.A., entitled "American Architecture." The House List for Session 1912-13 will be announced.

THE ARCHITECTURE OF STAMFORD.

On January 26 Mr. H. F. Traylen, A.R.I.B.A., gave a lecture on the "Architecture of Stamford," before the members of the Leicester Architectural Association. The lecture was illustrated with a series of lantern slides of the chief features of architectural interest in Stamford.

Mr. Traylen pointed out that, whilst there was no Saxon work in Stamford, they had an admirable example of that period in the neighbouring church at Barnack, about three miles distant. The oldest work in Stamford was the Norman Priory of St. Leonard. It was founded by St. Wilfrid of Ripon in the VIIth century, and was restored soon after the Conquest by William of St. Carlief, Bishop of Durham. The ruins consist of the west end of the nave of the chapel, five arches of the north arcade, and part of the clearstory above them. Two or three of the eastern bays may date back to the Conquest, the rest are stamped with details of later periods. The glory of this interesting fragment is the west front, which dates back to the end of the XIIth century, but was restored by the Marquess of Exeter in 1833.

This Priory is especially interesting becau of the features showing the transition fr the Norman to the Early English, cushi caps, simple moulded arches, no carving; the next arch there are bell caps, rich mouldings and slight "feelings after" stiff-stalked XIIIth-century work, and the respond the sturdy fat column is split into a central semicircular member w detached shafts on either side each s mounted by its own capital. The west fr continues the wonderful development in banding of the shafts, increased ornament the arches, almost fully developed carving, a other slight indications of perfect Ea English.

Tracing the development further, arcading outside All Saints Church is next order, the caps, columns, and arches of south arcade of the same church. Then, crown all, the beautiful St. Mary's, with arcading increasing in richness upwards to great windows, triple orders of arches s shafts.

The only portion of XIVth-century w in the town is the spire of this same chur and which has characteristic and grace details: the ball flower, the ogee curv arches, and each niche on the spires of tower containing a figure of an apostle.

The XVth-century work is especia beautiful; all the essential details are pres in the south aisle windows, but under t centred arches; the buttresses are notably good.

Of the later Perpendicular there are seve very fine examples in parts of All Sai Church, St. John's Church, St. Marti Church, Browne's Hospital (XVIth centur all well worth study in all details stonewo woodwork, roofs, and other parts.

Mr. Traylen here ended his description the Gothic and continued his lecture into Renaissance, the houses supplying all tha real lover of this style could wish. There Tudor work, gables, stone mullions, curio wrought in the fitting on of the flat gable the bay below.

St. Paul's-street is a fine example, owes its picturesque appearance from fact that the gables face the street.

Queen Anne work is represented splendid examples in St. George's-squa Barn-hill, High-street: no keystones o the windows, beautiful overdoors, project cornices.

Next we have Early Georgian double even treble keystones to door and wind projecting quoins, classic doorways, cons and brackets to the cornices, some project 3 ft.

The old walls, bastions, Castle-hill, remains of Castle Chapel, crypts, tombsto and woodwork were also described.

These were all illustrated by means lantern slides, as were also many ot features of ecclesiastical architecture in Decorated and Perpendicular styles.

The Domus Dei of Stamford.

Stamford possesses some fine monuments
n the churches, notably those of the great
ord Burghley and other members of the
ecil family, in St. Martin's, and the
hillips and other monuments in St. Mary's.
tamford possesses a considerable number of
ede houses, most of which are of great
nterest to the architectural student, and Mr.
raylen ably described and illustrated the
omus Dei of Stamford (Browne's Hospital),
nd the Bede House founded by the great
ord Burghley. Passing to domestic archi-
cture in which Stamford is exceptionally
ch, the lecturer showed views of Burghley
louse, and of examples of Tudor and
enaissance work in various parts of the
own. Reference was also made to the
xcellence in design of many of the shop
onts.

As a residential town Stamford is excellent,
s added, and the scenery and surroundings
re delightful. People imagine that the town
flat, being in Lincolnshire, but it is not so.
he Welland runs through the ancient
orough of this the third oldest corporation
n England, which is connected with English
istory from Danish times.

ARCHITECTURAL SOCIETIES.

York and Yorkshire Architectural Society: Life of Michele San Micheli.

A lecture by Mr. J. Stuart Syme, ic.R.I.B.A., was delivered on the 14th ult. efore this Society on "The Life and Work f Michele San Micheli." The President, r. A. B. Burleigh, Lic.R.I.B.A., occupied ie chair.

In the course of his paper Mr. Syme id:—

"A study of the life of San Micheli is teresting not only on account of the dis-nctive qualities of his work, but also on count of his position in perhaps the most portant period of the Italian Renaissance. orn in 1484, the son of an architect, brought o in an architectural atmosphere, sent to ome at the age of sixteen to study for his rofession, it is not surprising that he eveloped into an architect *par excellence*, in ntradistinction to some of the other masters ho bestowed part of their allegiance on the her arts of sculpture and painting. Nor is surprising that his work appears to have rtain architectonic qualities lacking to some ttent in the works of his contemporaries. he most famous architect practising during n Micheli's youth was Bramante, who was gaged during the early part of it in Lom-rdy, not so very far from Verona, and ring the later years in Rome. In fact, the outh and the master went to Rome about e same time—namely, about the year 1500, ramante to engage in the work of the

Tower of St. Mary's Church, Stamford.

Cancellaria and Giraud Palaces, and the youth, we can hardly doubt, to seek inspiration equally from new and old work, the practice then, as it is to-day. We may be

St. Leonard's Priory, Stamford.

pardoned, therefore, for supposing that San Micheli came under Bramante's influence, and there is something to support this in the similarity of the façades of the churches of Santa Maria in Organo at Verona and San Satiro at Milan, not to mention other points of similarity in various window and other details.

San Micheli's greatest claim to fame arises out of his military architecture. His first direct connexion with such work appears to have occurred when he was about thirty years of age, and within a few years he had effected a revolution in the design of permanent fortifications, the importance of which entitles him to rank with Vauban among the greatest of military engineers of all time. This work was the invention of a new type of bastion, whose front was angular, the apex towards the attack, and the subtending sides when produced cutting the line of the curtain outside the bastion and at points more or less remote from it as circumstances directed. The new arrangement permitted the faces of the bastion to be completely swept by fire from the curtain, and also to some extent from the adjoining bastions. This was impossible with the square and circular towers in use previously, and, combined with the other new features the designs presented, was of enormous advantage to the defence. It should be pointed out that Viollet-le-duc has disputed San Micheli's claim to this honour, in favour of some unknown French engineer, but his evidence is by no means conclusive. San Micheli seems to have been engaged almost exclusively in fortification work for a number of years, and there can be little doubt that this experience, which involved a careful consideration of questions of utility and sound construction, greatly influenced him when called upon to design works of a more decorative and architectural character.

Two of his finest buildings are the Porta Nuova and Porto del Palio at Verona, both designed with remarkable simplicity and directness. He also designed amongst other work four fine palaces in Verona, of which the Pompeo and Bevilacqua are the most notable, and the Grimani Palace at Venice, the perfection of whose lower storey is somewhat marred by the faulty proportion of the upper stages for which it is possible that San Micheli was not responsible. He made several designs for churches, but, unfortunately, few of them were carried into execution, and even these were not completed in the author's lifetime. As a designer he was gifted with considerable facility, which he exercised with the greatest refinement and restraint. His work, while sound both constructionally and artistically, is never dull, and does not lack originality. If we may believe Vasari, the character of the man was in keeping with his work, and would justify one in regarding the study of his life and art as well worthy the attention of the thoughtful members of his profession."—A hearty vote of thanks was accorded to the lecturer on the proposition of Mr. G. W. Milburn, seconded by Mr. A. Cowman, Lic.R.I.B.A.

The following officers for the present session have been elected:—President, Mr. A. B. Burleigh, Lic.R.I.B.A.; Vice-Presidents: Mr. T. W. Whipp, A.R.I.B.A., and Mr. J. H. Rutherford, Lic.R.I.B.A.; Hon. Treasurer, Mr. J. D. White, Lic.R.I.B.A.; Hon. Librarian, Mr. E. R. Tate, Lic.R.I.B.A.; Hon. Secretary, Mr. Harold E. Henderson, Lic.R.I.B.A.; Assistant Hon. Sec., Mr. J. M. Andrew; Members of Council: Messrs. A. E. Munby, A.R.I.B.A., S. R. Kirby, Lic.R.I.B.A., F. Dyer, K. Ward, Lic.R.I.B.A., J. M. Andrew.

The prizes for the best set of Measured Drawings have been awarded by the assessor, Mr. A. E. Munby, M.A., A.R.I.B.A., to:—First, Mr. C. Leconby; and second equally divided between Mr. D. Morrell and Mr. C. W. C. Needham.

Glasgow Royal Technical College Architectural Craftsmen's Society: A Cistercian Monastery.

At a meeting of this Society on the 16th ult. Mr. James S. Boyd presiding, a lecture was delivered by Mr. Jas. A. Lauchlan, entitled "A Cistercian Monastery: (1) Historical; (2) Architectural; (3) a Plea for National Art Tradition." The first part dealt with the history of Europe from the beginning of the Christian era to modern times: it showed how Christian Monarchism originating in Egypt, was introduced into Europe *viâ* Rome, and was organised to suit European ideals by St. Benedict, whose rule of life became one of the most important factors in mediæval civilisation. Then followed an outline of St. Bernard and his work, and the influence of the Order on agriculture, commerce, and art in particular. The lecturer described the Anglo-Romanesque School of Architecture and the influence on it from the Continent. Although there was no style of architecture peculiar to any of the monastic Orders, independent of the country in which they settled, yet the uniformity in arrangement of plan and design in Cistercian works makes the houses of this Order easily picked out from that of their contemporaries, and this peculiarity of Cistercian work was pointed out as one of the most important influences at work on the architecture of the XIIth century. The keynote to Cistercian work was shown to be a logical simplicity of purpose, a rejection of all unnecessary features and ornament which was a direct contrast to the work of their contemporaries. The development of their plan from the simple unaisled churches of their first years to the typical Cistercian plans of Kirkstall and Fontenay was followed, then after the development of the presbytery from the simple unaisled examples of Buildwas and Kirkstall to the more or less complicated systems of Citeaux Pentigny and Fountains, Roche and Bylands was shown, explained by the need for more chapels as the number of

Doorway, Barn Hill, Stamford.

monks in Orders increased. In general design and construction simplicity was again the predominant feature. The aisles were merely passages for intercommunication, and where not vaulted were covered with simple lean-to roofs: there were no triforiums at first (*e.g.*, Fountains, Buildwas, and Kirkstall), although introduced later at Rochecet; the details were kept simple in form, and, although there are signs in later works of a break away from former austerity, yet it is always marked by a quiet restraint and refinement. The treatment of gable and external walls was illustrated by examples at Fountains, Kirkstall, Bylands, Tintern, and others. Regarding pointed arch-vaulting, it was shown that the Cistercians, though not the inventors, hastened the popularity of the former, and were one of the first to arrive at the complete Gothic solution of the ribbed vault, as the result of local experiment by the monks. The arrangement of conventional buildings and apartments was fully described. The lecturer appealed for a revival of arts and crafts, a revival of Gothic, and styles practised by our fathers, founded on the principles of truth and virtue as taught by the seer of Coniston, John Ruskin.

GENERAL NEWS.

Professional Announcement.

On and after Monday, March 4, the address of Mr. H. Ascough Chapman, F.R.I.B.A., architect, Leeds, will be Cantelupe-road, Bexhill-on-Sea.

Slade Professorship, Cambridge.

Supplementing our note (p. 201) that Mr. Edward S. Prior has been appointed as Professor Waldstein's successor, it may be mentioned that the first holder of the Professorship (1869) was Sir M. Digby Wyatt, and the other architect who has occupied the chair (1886) was J. H. Middleton, who died in 1896.

The Royal Sanitary Institute.

His Royal Highness Prince Arthur of Connaught, K.G., has consented to become Patron of the Twenty-Seventh Congress of the Royal Sanitary Institute to be held at York in July next.

A Museum for Brentford.

The late Mr. Thomas Layton, F.S.A., of No. 22, Kew Bridge-road, Brentford, who died on September 4, aged ninety-two years, has left estate of the gross value of 43,360*l.* Subject to the interests of certain beneficiaries for life, he has bequeathed 20,000*l.* Consols, his residence in Kew Bridge-road and grounds, his collection of early British bronze and other implements, and his pictures, prints, and articles of *vertu* to three trustees for the establishment and housing in the premises of a "Layton Museum" for the benefit of students, over eighteen years of age, interested in antiquarian and scientifical research. The trustees are empowered to devote portion of the capital to enlarging or rebuilding the premises upon the present site.

Decoration of the Houses of Parliament.

It will be remembered, says the *Times*, that some fifteen months ago the east corridor, leading from the Central Hall in the Houses of Parliament to the lower waiting hall, was decorated by six historical panels. The subjects, chosen chiefly from the Tudor period, were from the reigns of Henry VI., Henry VII., Henry VIII., Edward VI., and Mary, and the harmonious Gothic decoration achieved by the six painters, who worked in association with each other, has given a great deal of pleasure to members and visitors. Above five of the panels in this corridor are windows, but the space above the sixth panel is filled in with masonry. The donor of the fresco beneath was the ninth Earl of Carlisle, and the painter Mr. F. Cadogan Cowper, A.R.A., the subject being Erasmus and Thomas More visiting the children of Henry VII. at Greenwich. Lord Carlisle suggested, when the scheme was in train, that the tympanum of the arch above this picture should also be decorated, and generously undertook that it should be done at his expense. Mr. Cadogan Cowper was accordingly commissioned to decorate the tympanum of the arch, and the paintings, which are presented by the executors of the ninth Earl of Carlisle, are now being placed upon the spaces above Mr. Cowper's fresco. The subjects are the Kings Edward IV. and Richard III., with the arms, badges, and devices of the House of York.

Submitting of Plans.

At a recent meeting of the Garstang Rural District Council the Inspector reported that certain alterations and additions were being made to a residence, and that plans of the alterations had not been submitted to and approved by the Council, as required by the Council's by-laws. A letter had been received that morning from the architects, forwarding the plans, and expressing regret that plans had not been submitted before the work commenced. It was unanimously resolved that the architects be forthwith directed to stop the work and to pull down such portions already done as might be necessary to enable the Council's Inspector to examine the work, and a Committee was appointed with power to pass the plans afterwards if the same are found satisfactory. The Council intimated that in future if buildings were commenced without plans having been submitted and approved, in compliance with the by-laws, it was their positive intention to take legal proceedings.

CORRESPONDENCE.

Padbury *v.* Holliday, Ltd.

SIR,—The verdict in this case, as reported in last week's *Builder*, is of special interest to master builders, and one which merits their active consideration.

I venture to suggest the responsibilities of builders on their own work are sufficiently great as to necessitate some remedy to guard against the liabilities of the sub-contractor being added to their own.

This, I think, is best dealt with by a proper form of sub-contract.

In my own business I insist upon sub-contractors complying with Clause 20 of the Institute contract and signing a proper sub-contract, yet it is most curious that in many cases I am met with the answer that other builders, including many large firms, do not require a sub-contract, but are content to place a brief order only, thereby not only adding to the builder's responsibilities quite unnecessarily, but acting in direct contravention of the terms of their own contract.

Let me suggest that if every builder, in fairness not only to himself, but to his competitors, insisted on the use of a proper form of sub-contract one would hear less of the vexatious difficulties affecting not only the builders, but the architect and the client.

F. J. GAYER
(E. A. Roome & Co.).

St. Martin's Church, Kensal Rise.

SIR,—My attention has been drawn to the following extract from a lecture delivered by Mr. Thackeray Turner at the Carpenters' Hall on "The Unity and Difference in Art and Craft," and published in the *Builder* of February 2:—

"I made a pilgrimage the other day to Kensal Rise to see Batten's wonderful altar-piece, which was exhibited in the last Arts' and Crafts' Exhibition held in the New Gallery in Regent-street. The only satisfactory way of seeing it, I think, is to get sufficiently near to exclude from view all the surroundings, and to my eyes its great beauty only intensifies the offensiveness of the church itself. Had the triptych not been there I could have gone into the church and walked out again with the usual feeling that it was just a commercial production, but as matters now are one cannot help being exasperated with the complete absence, save the presence of the picture, both of art and of craft in the whole building. The pulpit is most elaborately worked in richly-coloured alabaster. The mason who fixed it used red putty, doubtless according to instructions or custom, to form the joints. In parts the alabaster is cream coloured, but still he used the red putty. Could that man have had any spark of interest in what he was doing? Of course, it is needless to point out that the whole pulpit is as wrong as it could be. It is obvious that if you have a natural material which is richly figured in itself, and you pick out the most varied pieces as being most beautiful, you should not carve it in order to add beauty, because by doing so the carving destroys the beauty of the marble, and its beauty destroys the effect of the carving."

I cannot defend the red putty, and I only know enough about the theories of carving in richly figured natural material to know that one school, to which the lecturer clearly belongs, says it must not be carved, another says it may be. As to the "complete absence save the picture of art and craft in the whole building," there is a good deal which evidently the lecturer did not know. The greatest pains have been taken to have both art and craft in the worthy decoration of the church. If they have not succeeded, the fault is not of "commercialism" in those responsible, but of the artists' or craftsmen's failure. Other judges, possibly as competent as the lecturer, have come to conclusions different from his. The same "Arts' and Crafts' Exhibition" that contained the beautiful triptych contained also Mr. Payne's cartoons of the east window, and the two artists worked, the one recommended by the other, in knowledge of each other's plans. The same Exhibition contained specimens of the beautiful letters designed by Mr. Gill, and the metalwork of Mr. Harold Stabler, who together wrought the memorial tablet on the south wall of the church. The woodwork of the choir stalls, screens, and morning chapel was designed by the late Mr. Dan Gibson, of Windermere, and fashioned by craftsmen of Kendal and Exeter in the workrooms of Simpson & Read. I mention the names because I believe they are well known for the best work to those who are expert in these matters. The memorial tablet to Dean Vaughan was designed by Mr. McGill on the recommendation of the late Lord Carlisle, a trustee of the National Gallery of British Art. The morning chapel window, it is enough to say, was designed by Mr. Anning Bell, than whom abroad or at home few English designers are better known. I agree with the lecturer that without harmony there cannot be art as a whole, and that the artist's works in the church are not yet harmonised. How can they be for these reasons? The church is eleven years old; the work has to be done slowly because we of Kensal Rise have little money, and we can only get one thing at a time; though the harmony is not there yet, the need of it has never been lost sight of. Only a month or two ago one of the foremost architects and designers in London spent several hours in the church with me in study and suggestion as to the best way of continuing the necessary decoration and attaining the harmony desired. Who will give us 1,000*l.* or more? Will the lecturer, whose aim, if it be worthy, must be no damage, but delight?

A. M. HANLEY, Vicar.

INTERCOMMUNICATION COLUMN.

Public Swimming-Baths.

SIR,—If your contributor, "Welwyn," can to communicate with me, I shall be pleased to give him information as to the first cost one or two existing baths of the size requires, the method of warming the water and the cost of fuel, etc. NEMO.

The Possibilities for an Architect in Australia

SIR,—I understand from various sources that the building trade is booming in Australia and I have been considering the possibility for an architect there. It appears that in Tasmania there is a demand for architects, and I shall be obliged if any of your readers can give me any information which would be useful to a young architect about to emigrate. My intention would be to obtain a position of an assistant and for this purpose I shall be glad to know of publications, such as the *Builder*, or of any other means of getting into touch with Tasmanian or Australian architects.

TUESDAY, MARCH 5.

n Royal Institution.—Professor Ernest G. Coker, , D.Sc., on "Optical Determination of Stress and Applications to Engineering Problems"—II. n.

Northampton Polytechnic Institute (Illuminating Engineering).—Mr. A. C. Plumtree on "The Practical Use of Arc Lamps." 7.30 p.m.

Institution of Civil Engineers.—Papers on "Roller and Ball Bearings," and "The Testing of Anti-Friction Bearing Metals." By Professor John Goodman, M.Inst.C.E. 8 p.m.

WEDNESDAY, MARCH 6.

Carpenters' Hall, London-wal (Lectures on Arts Connected with Building).—Mr. W. S. Frith on "Form and Vision: with Reference to Art." 7.45 p.m.

Royal Academy o Arts. Mr. A. P. Laurie, M.A., D.Sc., on "Grounds and the Methods of Painting." 8 p.m.

Royal Archæological Institute.—Mr. Aymer Vallance, M.A., F.S.A., on "Old Bridges in England and Wales." With lantern illustrations. 4.30 p.m.

Edinburgh Architectural Association.—Mr. Andrew Ednie on "Comparisons of Styles in English Interiors."

Northern Architectural Association.—Ordinary meeting. 7.30 p.m.

Institution of Civil Engineers. Students' visit to the Associated Portland Cement Manufacturers' Works, Swanscombe, Kent.

Royal Society of Arts.—Mr. T. Thorne Baker on "Some Modern Problems of Illumination: The Measurement and Comparison of Light Sources." 8 p.m.

THURSDAY, MARCH 7.

Carpenters' Hall, London-wall.—Sir Laurence Gomme, F.S.A., on "The Folklore of London." 8 p.m.

Royal Sanitary Institute. Mr. Edward Willis, Assoc.M.Inst.C.E., F.S.I., on "House Drainage." 7 p.m.

Society of Architects. Mr. A. Alban H. Scott on "The Testing of Materials." 8 p.m.

Institution of Electrical Engineers.—Mr. W. W. Lackie on "Tariffs for Electrical Energy with particular reference to Domestic Tariffs." 8 p.m.

FRIDAY, MARCH 8.

Royal Sanitary Institute. Provincial sessional meeting, Municipal School of Technology, Sackville-street, Manchester (1) Discussions: "The Application of the Housing and Town Planning Act to the Re-development of Suburban Areas now in Process of Transition," to be opened by Mr. F. W. Platt, building surveyor, Salford; (2) "The Quantity of Water Available from Upland Drainage Areas," to be opened by Professor J. Radcliffe, M.Sc.Tech. The chair will be taken at 7.30 p.m. by Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Institute.

Leicester and Leicestershire Society of Architects.—Mr. Walter Gilbert on "Metalwork." Lantern illustrations. 8 p.m.

Royal Academy of Arts.—Mr. A. P. Laurie, M.A., D.Sc., on "The Chemistry of Building Stones and Cements." 8 p.m.

Royal Sanitary Institute.—Mr. Edward Willis, Assoc. M.Inst.C.E., F.S.I., on "Building Materials." 7 p.m.

SATURDAY, MARCH 9.

Royal Sanitary Institute.—Members meet at St. Margaret's Church, Prestwich, at 1.45 p.m., and proceed to inspect the new service reservoir at Beaton Park, under the guidance of the resident engineer. 3 p.m.—The party will proceed to the new lake to inspect the works.

COMPETITION NEWS.

North-Western Polytechnic.

Mr. W. Flockhart, F.R.I.B.A., was the assessor in the competition for a proposed polytechnic in the Kentish Town-road. Seven architects were invited to send designs, and the award has been given to Mr. Arnold Mitchell, F.R.I.B.A.

Bolton Infirmary, Nurses' Home.

Mr. John B. Gass, F.R.I.B.A., the assessor in this competition, has issued his award as follows:—First premium, 30*l.*, Messrs. Henderson & Brown; second premium, 20*l.*, Messrs. Marshall Robinson, Son, & Wheeler; third premium, 10*l.*, Messrs. T. E. Smith & Son. The competition was confined to architects practising in Bolton, and the estimated cost of the work is 8,700*l.* Eleven designs were submitted.

Public Hall, etc., Spennymoor.

The first premiated design in this competition is by Mr. Geo. T. Wellburn, 115, Albert-road, Middlesbrough. The second and third respectively are by Messrs. Clark & Moscrop, Darlington, and Mr. A. Farndale, Brotton, Yorks.

New City Hall, Newcastle.

The New Town Hall Committee, Newcastle-on-Tyne, have had under consideration the question of a site for a new City Hall in accordance with the resolution of the Committee confirmed by the Council in 1905. The Committee are of opinion that the most suitable site for the purposes of a new City Hall would be that now occupied by the Northumberland Baths, which contains an area of 4,030 sq. yds. The cost of the proposed scheme, including a large hall to seat 3,500 persons, a small hall to seat 800 persons, reception-rooms, furnishings, contingencies, etc., and site, is roughly estimated at 100,000*l.* The value of the land is estimated at 36,270*l.* If the Council approve of this recommendation the Committee advise that they be authorised to advertise for competitive designs for a new City Hall to cost approximately 100,000*l.*, including site, and to offer therefor the following prizes for the three best: First, 500*l.* (to be merged in commission in the event of the recipient obtaining the work); second, 250*l.*; third, 125*l.* This expenditure would be defrayed under the provisions of the Municipal Corporations Act.

Auchterderran Drainage.

Messrs. Menzies & Cockburn, C.E., 33, York-place, Edinburgh, have been awarded the first premium of fifty guineas offered by the Kirkcaldy District Committee for competitive plans for the Auchterderran drainage scheme. The second premium was awarded to Messrs. Kyle & Frew, C.E., 216, West George-street, Glasgow. Mr. Douglas, C.E., of Hamilton, was the assessor.

ILLUSTRATIONS.

The Arthur Cates Prize Drawings.

THIS sheet is one of the four strainers submitted for the Arthur Cates Prize, 1912, by Mr. J. B. F. Cowper. It is stipulated in the conditions for this prize that a selection of the testimonies of study prepared for the Final Examination R.I.B.A. shall be submitted, and this sheet, with two or three extra ones, comprises the measured drawings. The chapel of St. Leonard, Kirkstead, is completely of one date.

The exquisite proportion of the parts, the great delicacy of the mouldings, and the rare beauty and grace of the carved foliage (which probably owes its present perfect condition to the plastering over of the whole interior in the XVIIth century) in combination, form the most graceful and perfect example of the period.

The other drawings are of the vaulting to the chapel, and a similar sheet from Beverley, to show the construction of a Gothic vault, the tas-de-charge being worked out half full size, and various other details being shown.

Mr. Cowper, the Arthur Cates prizeman this year, is a student of the Manchester School of Architecture (Professor Capper).

East Sussex Hospital, Hastings, Competition.

IN our issue for the 16th ult. we gave the first premiated design, by Messrs. J. Saxon Snell and Stanley M. Spoor, for the East Sussex Hospital, Hastings, and we now reproduce the designs placed second and third.

The authors of the second premiated design, Messrs. C. K. & T. C. Mayor, of Manchester, in their report accompanying their design lay particular stress on the manner with which the levels have been manipulated, especially with regard to economy, not only in construction, but for subsequent administration.

Proposed New East Sussex Hospital, Hastings.
Second Premiated Design, by Messrs. C. K. & T. C. Mayor.

The adoption of the "single corridor" principle, they state, would also trend to attain the utmost economy, efficiency, and most direct supervision. The site for the chapel and the future extensions, it will be observed, are placed behind the main corridor, so that in the event of future building the principal façades would remain undisturbed.

Included in their schedule of leading features in the planning we note the following:—

Pavilions placed with their long axes north and south.

Surgical wards and operating theatre are adjacent, with north light to theatre.

Dispensary serves both the out-patients' department and, by means of lift, all floors of the main hospital, the medicine stores, being below, are immediately under the dispenser's control, the stores being approached from the rear.

Facility provided for future extensions.

The ground floor of the in-patients' department all practically level.

In-patients' lift centrally placed, and also in immediate communication with casualty and reception blocks, with the resident doctors' quarters adjoining.

Facilities afforded for future extensions in both the out-patients' department and the nurses' home when required.

Out-patients' department self-contained, but at the same time is so arranged that in cases of emergency communication with the in-patients' staircase can readily be established.

The eye wards would have north light, and a small operating-room has been arranged for each sex.

The isolation block is placed at the highest part of the site.

The whole of the staff dining-rooms are centralised, this part of the administration buildings being very carefully planned with a view to sequestering the delivery of the stores, dining-rooms, service-rooms, and the kitchen, scullery, larders, etc., from the patients' wards, although all so focussed that the food trollies can be run directly to the wards and every part of the hospital which is to be inhabited without confusion or loss of time.

The kitchen, etc., is designed upon the uppermost floor, cross-ventilated and top-lighted, and the adjoining service-room and lifts have direct access to each floor.

The staff dining-rooms are on the same level as the nurses' home.

The matron's office occupies a central position attainable from the main corridor.

The position of the laundry block, directly behind the administration block, containing the sewing-rooms, etc., is convenient to the housekeeper's quarters, and the covered way assures shelter for the maids.

The medical staff quarters, secretarial department, board-room, etc., are entirely isolated from the patients' wards and such portions of the hospital as are devoted to the usual nursing and other staff at the same time being in sufficiently close touch with all the in-patients' wards, etc., whenever occasion should arise.

Attention should be drawn to the position of the stores entrance, which is at the east end of the main corridor and quite away from the in-patients' wards.

To the children's ward a day-room has been provided, and, as will be seen from the plans, separate sanitary accommodation is allowed for the small wards in the main pavilions.

"It is proposed to adopt fire-resisting material throughout as far as possible, the floors being of steel and concrete. The floor finish to wards to be of fine concrete, covered with linoleum, and all flooring tinted yellow on the plans where not finished with wood blocks to have the boarding nailed direct to breeze concrete. The walls of all wards, out-patients' department, corridors, etc., to have glazed brick dadoes up to a height of 4 ft., finished above with Parian cement. The sanitary turrets to be lined with glazed bricks or tiling from floor to ceiling. The operating theatre is proposed to be lined with a dado of marble, with "adamant" above, and to have the floor paved with "terrazzo," the ceiling being glazed with "opalite." The corridor floors to have granolithic finish, and all principal entrances, etc., to be paved with "terrazzo." Rounded angles are intended to all wards, etc., both at floor and ceiling levels, as well as at the junction of the walls. Where flat roofs occur a covering of "Seyssell" asphalt is proposed, and Welsh slating is proposed where slated roofs occur. The covered ways to have iron sides up to a height of 4 ft., with a space left above the floor level to enable any driving rain to be thrown off at once. All lavatories, sinks, and water-closets to be on the corbel principle, clear of the floor. A subway is provided for the whole of the water, steam, gas, and electric mains, and is lighted and ventilated by lateral windows.

Natural ventilation is advocated throughout the whole of the infirmary, supplemented in such portions of building as may be considered advisable, such as the kitchens, laundry, waiting halls, etc., by electrical fans. In all wards and all buildings used by patients practically all the window space is capable of being thrown open to the fresh air; sash and frame windows being intended, with transom lights placed above, opening inwards, fitted with hoppers with glazed cheeks, and adjustable to the velocity of the wind, so that complete cross-ventilation would be attained. Behind each radiator is intended to be placed a large fresh-air inlet, and the atmosphere of the room would be capable of being changed three times every hour. Extraction shafts on the side walls of the main wards, nurses' home, etc., would also be provided to supplement their ventilation. In the kitchen, laundry, etc., the top lights would open laterally with mechanical gearing.

The front elevations are intended to be of red pressed brick, with Portland stone sparingly used in bands and occasional broad masses where necessary, the principal bays, etc., being all stone."

The authors estimated the cost of scheme at 47,375*l*.

Messrs. H. Percy Adams & C. H write :—

"This plan was evolved after a very ful study of the site, the levels, and existing trees which were capable of pr ing a very effective shelter from the vailing winds and gales. The access t site required careful study; the lowest

Proposed New East Sussex Hospital, Has
Third Premiated Design, by Messrs. Adams & Ho

was 15 ft. above the road and it wi readily seen that a roadway 200 ft. to 3 long was necessary to deliver at this The buildings were placed on the most part of the site, and each block would a clear view of the sea. The boiler-ho placed at the lowest point of the site. outpatients' department and dispensary the same level as the lift and in close imity to it.

The children's ward is centrally p and is provided with a very wide ba part under cover and part open and i view of the sea."

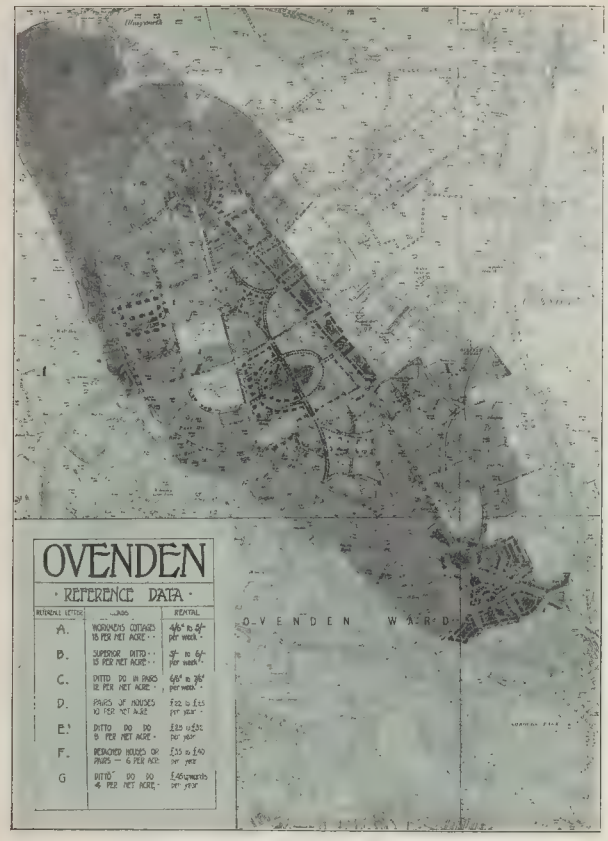
THIRD PREMIATED DESIGN. BY MESSRS. H. PERCY ADAMS AND C. H. HOLDEN.

MONTHLY REVIEW · *of* · CIVIC DESIGN.



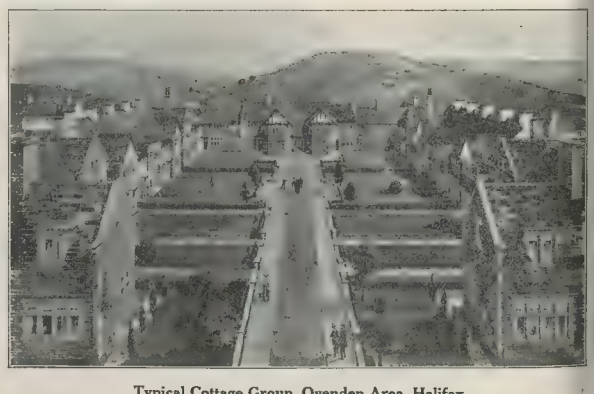
General Plan of Halifax Town Planning Scheme.
First Premiated Design, by Messrs. Longbottom & Culpan.

HALIFAX TOWN PLANNING COMPETITION.

our issue of January 26 we announced the result of the competition for a Town Plan of Halifax in which premiums were H by the Member for the borough, the Hon. J. H. Whitley, M.P. The com-on was limited to local architects, eight om competed. Professor Adshead, who as the assessor, awarded the first pre- of 100 guineas to Messrs. Longbottom lpan; the second, of 30 guineas, to . Medley Hall & Son; and the third, of neas, to Messrs. C. F. L. Horsfall &

scheme is the largest and most compre-e that has yet been made the subject petition between architects, and its tly satisfactory result is therefore the gratifying, and should lead to the co-on of architects being sought in con- with other schemes promoted by the parties. Mr. Whitley is to be con-ted upon the design which is the out- his public-spirited action in promoting the competition. The Corporation are taking steps to submit a scheme dealing with certain areas to the Local Government Board, and although it does not appear that they have as yet adopted Messrs. Longbottom & Culpan's plan, they could not do better than take it as their basis, with Professor Adshead's report, a valuable monograph on town planning for the world at large as well as for Halifax, as their manual.

This is one of those problems in planning whose fascination lies in its difficulties. Architects have frequently found the most interest in design and plan and the greatest ultimate success in problems before which they were at first aghast, and this applies in town planning as in the design of buildings. In this case the difficulties are in dealing with the extraordinary contours of the country. On first regarding Halifax and the surrounding district as an area for orderly development the most experienced town-planner would probably join with fervour in the tramps' litany, "From Hull, hell, and Halifax, Good Lord deliver us!" Here is an industrial town of some 120,000 inhabitants, its centre so deep-seated among the hills, and those hills so steep and looming so hugely all round, that by day one seems to be closed in from the rest of the world, and by night one confuses hundreds of terrestrial lights with the constellations of the sky, and the vision of a lighted tram-car moving through what one has taken for some new constellation makes one stay to sort out the distant street lamps from the stars. The town has spread itself upon these hills in a most disorderly fashion. Though there is some semblance of order in the centre of the town, the roads leading to the outskirts, some new and wide, others old, crooked, and steep, pursue devious ways before they eventually stretch out to the old villages on the hills, at each of which a collection of old cottages forms the nucleus of an industrial community gradually widened until it has become



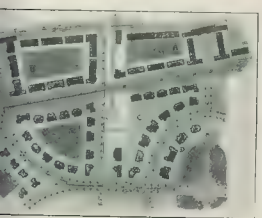
Treatment of Ovenden Area, Halifax.
First Premiated Design, by Messrs. Longbottom & Culpan.

merged into the town itself. Yet, amid the apparent confusion one can see how development has inevitably been guided by natural or social conditions. And this town has to develop further upon some plan; and what the hardy Yorkshiremen of eighty or a hundred years ago tackled, perhaps with more courage than foresight, when they perched their mills and their little industrial villages on the top of rocky crags like Heptonstall, or halfway up some gorge where the kitchen of one house is level with the ridge of another, and the mill grows out of the rocks near the stream from which it takes its power, the modern town-planner must not shirk.

In this Halifax scheme the conditions indicated some half-dozen distinct areas as sites where development is likely to take place during the next fifty years or so, and competitors were required to plan these sections to meet the residential and industrial demands of the coming years of expansion. There is, first, the river valley, stretching towards Sowerby Bridge, which is now a distressful agglomeration of railways, canals, sewage works, and waste places desolate enough, but bounded on one side by the beautiful Copley Woods and on the other by slopes crowned by the frowning crags above the Birdcage Walk—obviously an area for industrial expansion. Beyond are the areas of Pye Nest and High-road Well, the latter a vast open tract at a great altitude, and further to the north-east the fine plateau at Ovenden, touching Halifax at its southern end and stretching northward over a spacious expanse of country commanding wide views across the Pennines. The districts of Illingworth, Shibden Dale, and North Owram will probably not be developed in the immediate future, but competitors were required to indicate outline schemes for these districts.

There is no doubt that the plan of Messrs. Longbottom & Culpan, placed first by the assessor, is by far the best of those submitted. It lacks the broad treatment which so fine an opportunity demands, but no other competitor comes so near to it, and allowance must be made for the crippling effect of the limitation to scheduled areas imposed by the conditions. Apart from this it is, generally speaking, a fine scheme. The main roads are very carefully planned. Special re appears to have been paid to the e ordinary contours of the land, which very largely been allowed to direct the p ning. Without seeming to purposely di the roads the authors have neverth avoided undue interference with exis houses or plantations which should be served, and here and there pains seem have been taken to preserve fine trees. fact, the scheme is notable by reason of observance of the conditions imposed all kinds of existing circumstances. example, in the treatment of the High- Well section the present main roads, wid where necessary, have been retained, provision is made for the gradual deve ment of the area round the golf course so the latter will be the final portion of area to be absorbed in the building schem

With the exception of one or two error judgment pointed out in the assessor's re the authors have carefully considered the fluences, social and geographical, which course of time, will determine the typ residence to be allotted to each of sections. Although it would seem the trend of expansion would inevit assume certain very obvious direct which any competitor with his eyes to clear indications of present likely future circumstances could make mistake, the winners have distingui themselves by their appropriate selectio sites where other competitors have sign failed. They alone have adequately d with the river valley, of which the deve ment is the most imminent; and if scheme can save it from becoming the s of devastation that most of the popul Yorkshire valleys have resolved themse into in the process of civilisation it will amply justified itself. A large area near railway and canal is reserved for factor immediately above this are cottages for w people, and higher up the slope are house a better class, the limit of rental, howe being wisely kept low. The treatment this valley affords an opportunity for the vision of better communication betw Halifax and Sowerby Bridge, but secondary roads shown are unnecessa crowded. The Ovenden area is cle adapted for residential purposes, and treated as a separate garden city, rather separate, in fact. It is the finest of areas included in the scheme, so much so almost every competitor has regarded i his chance for a *pièce de résistance*, to judge by the pains taken to illustrate i plan and bird's eye view, considers it the important part of the scheme. The win deal with it with greater restraint, but wi very cleverly. The existing roads, w form a rather poor and muddled appro from the town, are gathered together in circular "place" at the south end; from a main road strikes northward as a backb to the estate, and, with other subsidiary r which take a more circuitous route, lead another circular "place," cleverly di guished from its southern counterpart by



Typical Cottage Group, Ovenden Area, Halifax.

We trust that the es will take the assessor's hint that should be acquired and retained instead of one day passing into the the builders.

THE CITY DEVELOPMENT PLAN.

On January 29 Mr. Raymond Unwin delivered the Warburton Lecture before the Manchester Society of Architects. In the course of an interesting address he said :—

"There is only one way by which we may be compensated in this country for delaying until now to undertake the proper arrangement of our towns, namely, that we may profit by the experience that has been gained in other countries; that we may avoid their mistakes and improve upon their successes. If we are to do this we must not only study what other countries have done, but we must base our estimate of the results of what we may propose upon a study of our towns, and we must do this sufficiently thoroughly to enable us to distinguish between accidental effects, due to some custom which may be modified, from essential effects dependent on economic laws.

I do not mean that our customs, our land tenure, or the particular form in which we raise our revenue, for example, are not important factors; but that town planning must, as far as possible, be based on the essential facts, for economic laws have a wonderful way of asserting themselves in spite of accidental customs. If it were not so, building and town development must have been brought to a standstill long ago by our custom of raising nearly the whole of the revenue for local administration by means of rates, which are virtually a tax on the rent of buildings.

I propose, in considering town planning problems, to accept these matters of rating, ground rents, etc., much as we find them, and to try and consider what are the essentials in connexion with town development, and in what way the town's growth may be assisted by a proper extension plan. If we were planning a new town the matter would be less complicated. We could begin from first principles, consider what the town should be, and lay out our plans accordingly; but in ninety-nine cases out of 100 what we are called upon to do is to make a plan to provide for the extension of an existing town. Therefore the town-planner must first be sure that he thoroughly understands the life and needs of the community for whose extension he has to provide; the study of the existing town can hardly be too thorough if the best results are to be attained.

In Düsseldorf they have found in the past, as a result of too great extravagance in the width and number of their roads, that they have so increased the cost of the development of land that it is becoming less and less possible to build self-contained houses for people of moderate means within the city, and there has resulted a tendency for the people to be crowded into huge blocks of tenement and flat dwellings. This tendency has not gone nearly so far in Düsseldorf as it has in other German towns Berlin, for example—but they are anxious now to check the tendency, and hence the care devoted to the subject in the survey. It is very remarkable that our country, which has for a century and a half watched the wonderful economies and the great progress which have resulted from the application of proper organisation and foresight to the carrying on of great industrial concerns, is only now beginning to realise that there may be some need to apply similar principles of foresight and organisation to the development of our great industrial centres, our towns and cities. It is difficult to see how we can have imagined in the past that it was safe to leave our towns to grow haphazard, the owner of each bit of land not only free to develop it just as he liked, without any central control, but even powerless if he wished to effect anything outside his own immediate boundary. What wonder that a hopeless jumble has resulted? But for the few old country highways leading into the town matters would have been ten times worse; as it is, except where such highways have saved the situation, it is usually impossible to get a direct route within our towns from anywhere to anywhere. No provision whatever has been made for expansion; roads that must obviously at an early date need to be widened to accommodate growing traffic have been allowed to be lined on each side with property built up to the road line. Railways have been allowed to hem in the town without any effort having been made to forecast its development and provide for the necessary bridges and other requirements for expansion, thus throttling the town and its traffic in many directions. Cottage property has been allowed to spring up along the margins of railways and canals, factories and workshops have been dotted about wherever a bit of land could be obtained for the purpose, often dumped down to the ruin of some good residential district, and always involving much needless carting to and fro of the materials of industry, adding greatly to the cost of production, to the congestion of traffic, and to the expense of street-making, widening, and maintenance, thus directly crippling the efficiency of the industry, and by destroying the amenities of the homes of those engaged in the industry still further indirectly crippling this efficiency. Not only is the industrial life of the community hampered, but the cost of administration is increased, and this again tends to restrict the development of the town, and leads to the congestion of buildings upon the ground, to the creation of slums, the destruction alike of the health, comfort, and happiness of the people, and to the enormous increase of their death rate.

Remedies for Overcrowding.

Most of this confusion and loss to the community can be avoided by a town extension plan. It is true that no man can foresee exactly what the development of a town will be; but put these errors of judgment at their very worst and compare them with what happens now. Is the town likely to suffer severely in pocket or in any other way from having bought up a little open space at slightly more than agricultural value beyond what is actually necessary, or for having made a road a little wider than actual requirements at a time when the land would have cost little or nothing and was free from buildings? At any rate, compare this with the way in which the public now has to pay for every site for a school or other building it requires, for every strip of road widening, for every scrap of open space, playground or park, just because it does not look ahead and provide for development, but waits until the ground is covered with buildings and has reached almost its maximum value before it makes these provisions. But the town plan will not only provide for the want of future extension, but by the very fact of doing so will control and guide development along just those lines which will fall in with this provision, and, therefore, it is really possible by the combination of such reasonable foresight as a town plan can embody, with such control and guidance as those enforcing a town plan will exercise, to adjust the provision to the future needs with a very fair degree of accuracy. A town plan can assist industry by reserving definite areas for industrial purposes, by arranging for the provision adjacent to these areas of all the required facilities, railway carriage, water carriage, ample siding accommodation, space for needful warehouses, bonded stores, and finally for securing within easy access adequate areas upon which those engaged in the industries can live under circumstances which will make for health, amenity, and the greatest efficiency. This is being secured by the city plan in many places.

Our municipalities have only just been given town-planning powers. In many cases, as in Manchester, they have done much without those powers and we are considering what further can be done by the aid of town planning."

The lecturer then described what had been done in the towns of Frankfort, Crefeld, and Cologne by means of a city plan. "Let us contrast the growth of Cologne with what has taken place in Chicago, where a town of 2,000,000 people has been developed at such a rapid rate that some still living can remember when there was only a settlement of a few hundred people there. This town has grown on a simple gridiron plan, if such can rightly be called a plan, dividing up the land into rectangular building blocks of much the same size whether the land is wanted for

factories or shops, palaces, or cottages. At first no provision was made for open spaces, main wide roads were not at first thought of, and the result has been perhaps the greatest aggregation of disorganised units of population that have ever been brought together. Chicago, which contains within itself a wonderful amount of public spirit backed by true American energy, is now seeking at enormous cost to rectify these mistakes, and has, indeed, done great things already. It has secured a number of fine parks, recovered and preserved long stretches of lake front; it has made and planted miles of magnificent boulevards and avenues, "park ways" as they are called in America. You may ride in a motor hour after hour around Chicago, and the whole of the time be travelling along its park ways and through the parks and hardly leave them. This green girdle is, indeed, a wonderful creation. They have, too, bought here and there one or more building blocks, and they have laid them out as playgrounds for the children. Unfortunately, in the past they have allowed the building blocks to be so covered with buildings that there is not enough space for air or light to reach to the rooms, much less for any garden space in which the children could play. They have now set themselves the task of providing a playground of some sort within half a mile of every child's home in the city; and perhaps the most interesting point about these playgrounds is that they are becoming local civic centres. They are beginning to provide for Chicago that grouping and organisation of its mass of humanity which hitherto it has wanted. In connexion with these playgrounds a large building called a "field house" is usually built, containing gymnasia, refreshment-rooms, reading-rooms, baths, and swimming-baths, a concert and dance hall, and different rooms for the use of trade unions, friendly societies, and any other similar bodies requiring a meeting-place. The "field house," with the numerous activities centred there, is becoming the focus of the neighbourhood in which it exists, and the amorphous mass of humanity around it is beginning to take on a definite relation to the centre, is beginning to group itself, as particles of a chemical solution group themselves into a beautiful crystalline form about some central point of attraction.

Propriety of Plan.

There is no doubt that the town must represent the character of the social life of the people composing it, and that it should express by its form the social organisation upon which it is based. I venture to suggest that the ideal form of town to which we should aim will consist of a central nucleus surrounded by suburbs, each grouped around some subsidiary centre representing the common suburban life of the district, and the suburb in turn will consist of groups of dwellings, workshops, and what not, developing some co-operative activity either in connexion with the building and owning of the houses or in connexion with the common enjoyment of open spaces, playing-fields, and so forth. To emphasise this ideal development of the town, first of all each individual suburb should be provided with its suitable centre, around which should be located its local municipal or administrative buildings, places of worship, its educational, recreational, and social institutions, and not only should this centre or heart of each district give expression to its unity, leading naturally to the grouping of the district around and in relation to this centre, but between each of these suburbs there might well be reserved some belt of open space, parkland, woodland, agricultural or meadow land, which would at once define one suburb from another and keep the whole of the inhabitants in touch with ample open space.

We are dealing with the town extension plan, and it is perhaps time to leave the consideration of the ideal town extension and see how far Mr. Burns's Town Planning Bill will enable us to approach this ideal. We shall find that that is further than at first we think, and we shall find that the obstacles based on real economic difficulties are less than at first we should suppose. The definite powers given by the Act are not many, but they are far-reaching. The community is empowered, through its municipal council, to make a plan, laying down the lines upon which all land surrounding it not yet built upon, and likely in the future to be built upon, shall be developed. Such plan may define the direction, position, and width of roads. The scheme which accompanies the plan may provide for the making of any of these roads that are urgently required for the public need. Any by-laws or other statutory enactment may be varied by the town-planning scheme so far as may be necessary to its proper execution, with a view to securing proper sanitary conditions, amenity, and convenience. The scheme may make restrictions on the number of buildings which may be erected on each acre of ground and the height and character of those buildings, and may prescribe the space about buildings. Finally, land may be purchased for open spaces or other purposes in connexion with the town-planning scheme. If these powers are considered carefully it will be found that little of what I have been sketching as the ideal development of a growing town cannot be secured under one or other of these headings. One of the special functions of the Act is to empower the local authority to make agreements with the owners of land on any subject bearing upon its development. The local authority is put in a favourable position for making such agreement, because it has not only power to restrict within certain limits the use to which the owner may put his land, but it has the power very greatly to facilitate that development by the suitable laying out of roads, and by the modifying of many existing restrictive by-laws which have been made to suit other conditions of development.

Economic Problems.

Both builders and landowners have been very much disturbed by the powers given in the Town Planning Act to limit the number and character of the buildings which may be put upon each acre of ground. I think it can be shown that these fears are not justified, but, on the contrary, that the greater the number of houses crowded upon the land the less economical is the use being made of it, the higher rate must the occupier pay for every available yard of his plot, and the smaller will be the total return to the owners of land in increment value, due to building operations. Our overcrowding system of development is so uneconomical, it wastes so much of the land in roads, that actually it would be possible, giving the landlord exactly the same total return from every house that is built and paying exactly the same for the streets, to provide the plot of land of 261 sq. yds. for 8½d. per week in place of a plot of 83 sq. yds. which costs 8d. per week. You will be able to see that not only is there no real economic difficulty in reducing the overcrowding of houses upon the land, but there is equally no economic difficulty in providing all the open space that is desirable not only around the town but within the town; because, even from the point of view of the owner of land, very much the same increment value arises from the given population, whatever the exact arrangement of it, and if you reserve a belt of park two or three hundred yards wide between the town and the adjacent suburb it simply means that you have extended the area of land which benefits by building increment as much farther out as is represented by the land which you have reserved unbuilt upon nearer in.

One other objection to the wider distribution of the population may be raised, namely, that we shall so largely increase the size of our town as to add very greatly to the difficulties of locomotion. Here, again, the difficulty is much less than at first sight appears, for we find on examining towns and comparing the average total population per acre with the population per acre in the congested districts that, in many cases, it is not the average that is seriously wrong, but that there is acute local congestion, and town planning can provide for the better distribution of the population and the more economical use of land. Just as it will avoid overcrowding in some directions, it will avoid the useless waste of land which often takes place in other directions, because areas, otherwise available for dwellings, are ruined by adjacent factories, or because consi areas are constantly being left proper facilities of access. Not only the case, but, owing to the fact that t of a circle increases much more rapid the diameter (in proportion to the sq the diameter, in fact), as a town g constantly diminishing addition has made to its diameter to enable it to its population.

The Advantages of Forethough

We have been considering almost exc the practical utility and the economic of regulating our town development o lines than in the past; but the purpos this is to make of our towns dwellin more fitting for a race of beings who live by bread alone, but who requi mental culture and an outlet for t pression of spiritual aspirations. you want to erect a new municipal b or a new cathedral, having settl requirements, practical or hygienic, t building must serve, you call in the to give form to the building, that express by its beauty something more thing which throughout the ages eve of man has felt to be necessary to th pletion of his works; and so must it be city building. When the surveyor settled the requirements, and the eco and engineers have settled the possi then we, as our forefathers did, m in the man of imagination, the ar clothe these requirements in some be form. The Greeks and Romans did you may see from the beautiful rec of Ephesus and other of their cities mediæval builders succeeded also, tho quite different lines, as is evident in burg, Nuremberg, or any city where æval remains to any extent exist town planners of the Renaissance manner gave order and beauty t cities, and their works, as being ne our own time, we should study with care, such examples, for instance, be seen in Paris, Karlsruhe, Tur Copenhagen. Your Society of Ar has already made sketches for a p a Manchester suburb, which are, no known to many of you, showing the l of treatment, the careful considera the grouping of the buildings an placing on the ground, which must fo of the final stages of town planning town is to become once more a b place to dwell in, and it is as necess mental and spiritual health that man live in beautiful surroundings as it his bodily health that he should dwel sanitary conditions. Town planning calls for a great co-operative effort to in our cities worthy dwelling-plac our social life. The individual mu his reward for sometimes sacrifici immediate interests and predilections far wider opportunities which a co-or development would afford, and, abo might I say here, he must learn to his own smoke literally and metaphc The engineer and the surveyor willing to co-operate with the artist, him on sound and practical lines, but him the freest possible hand in dealin the forms of expression, and the a must cease to regard each build erects as a unit in itself of which make what he likes, and must learn sider it as a detail in the greater picture, and must accept as his fir the subordination of that detail to effect of ordered beauty which the must learn to require and appreciat each may in this way do his share the creation of a beautiful city."

THE IMPROVEMENT LONDON.

THE annual meeting of the Garde and Town Planning Association was Carpenters' Hall recently, Mr. Neville, the President, being in the c

The President approved the sugges Professor Stanley Jevons that a congress should be called at Cardiff to town planning and garden city devel

ll parts of the world now there came Association inquiries and requests for ce and advice with regard to all forms den cities, garden suburbs, town g, and any movement which had regard better housing of the working classes. Association was to do the work in the which it was called upon to do there increased financial assistance, and he e appealed to every member to ur during the year to obtain an al subscriber.

Cecil Harmsworth, M.P., the Chairman Council, in an address on "The Pro- f the Movement," said that the close Association's thirteenth year of exist- nd it housed in more commodious and premises than it had so far occupied. d matter for congratulation was that chworth Company was now beginning ge on to a dividend-paying basis. He d that at Letchworth there was already ulation of 6,000 and twenty-eight , while most of the works were in of enlargement. The health rate at rth was incomparably better than any town or even any health n the United Kingdom. There were portant differences between a garden d a garden suburb. Although they, Association, were deeply attached to den city ideal, they were very glad garden suburbs springing up all over intry. There were thirty-seven of ther in actual existence or in course notion at the present. During the re had been two town-planning tours. ng to Mr. Burns's Housing and Town g Act, he expressed the opinion that he record of recent legislation came examined in the future it would be niversally recognised that that was atest measure of legislation of our . return issued recently, which had ised up to date for the purposes of ting by Mr. Burns, showed that the overnment Board had given authority re schemes in ten cases; notices had ven to twelve local authorities; had been devised in many districts; e were also under consideration thirty- re schemes, most of which would edly come to fruition. If, by the of proper town-planning methods den city means, they could secure ousing for the people they would be ore than was possible by any other o bring about that social amelioration they were all looking.

Professor Adshead's Scheme.

sor S. Adshead then read a paper on nprovement of London," which was d by original lantern slides showing s that could most easily be altered.

history of the growth of London in ediate past is a tale of inventive n and suburban expansion, and that have occurred in the matter of g tell us of the assertion of lism and the collapse of unification. has been the havoc caused by the railways, not only throughout but also in London, fortunately trimental influence has been con- ry largely to the southern and sections; and, except for gross ral vandalisms which have been perpetrated in certain localities, the portion of London is still preserved an heirloom of artistic completeness. has a character and an individuality her own. Unlike Paris, she is not great formality; nor is she like dependent for her interest in what escribed as a monumental modernity; n, is she like New York, a city us in scale and a miracle of . Compared with Paris, she gains ntage in the majestic scale of her in the interminable interest of her ue beauty; compared with Vienna, esses in her monuments the interest nd great architectural purity; and with New York, she possesses a of noble compositions altogether and impossible in that democratic

wth of a town, whether it be little n a hamlet or a city of eight depends in its direction upon the quality and style of the architecture, upon the applications of the inventor, and upon the administrative organisations that prevail. The loss of traditional influence in the architecture, the confusion of styles, or rather the lack of any style, and the pronounced commercial aspect inseparable from all building enterprise, which has produced and is still producing so injurious an effect upon our streets to-day, is greatly to be deplored.

Important as has been the recent improvement in the educational systems which have been devised for the modern architect, its effect has yet to be felt. Old London, though beautiful, is fast becoming obsolete; we are at the commencement of a great period of rebuilding, and although Bloomsbury, a district of dignified mansions, must be rebuilt as a district of residential hotels, there is no need to exchange the refined and dignified simplicity of four-storied compositions for the restless pyrotechnic trivialities which are exhibited in these modern eight-storied hotels. It behoves those of us who are interested in the architecture of London to see to it that with increased size in building we get at the same time a real increase in dignity and scale.

Compared with New York, London is an immense village in point of scale. The scale of modern London will need to be increased. Selfridge's Store (the conception of an American architect), compared with Harrod's or the Russell Hotel, exemplifies what I mean.

Much interest attaches to the parks. The parks of London are peculiarly her own. Compared with the Tuileries Gardens in Paris, the Luxembourg Gardens, and the Bois de Boulogne, they are informal -great reservations planted with forest trees and laid out at intervals with fully developed treatments of landscape design. From time to time schemes are forthcoming for imposing upon them formal treatments such as are found to perfection in other cities amidst architecture of perfect symmetry, as at Versailles, at Nancy, and as at the Louvre.

Whilst I feel that our one formal avenue—the Mall—is still capable of being greatly improved by the introduction of more sculpture, and, perhaps, by converting its boundaries on the parks into sculptural ways, as the "Siege Allé" in Berlin; and whilst other borders of the parks might be greatly improved by laying them out with flower-beds of formal design, as along the eastern edge of Hyde Park and along the Broad Walk in Regent's Park, at the same time I feel that cutting and carving in a wholesale manner is a thing strongly to be condemned.

Perhaps greatest interest at the moment attaches to the results that will follow in connexion with the electrification of our railways, the amalgamation of railway systems induced by the competitive interest of the trams, and the effect which will ultimately follow when the movement of the population has settled down after the disturbing effect of the many new means of locomotion.

The present time is momentous, and all who are interested in the future amenities of London should bestir themselves and see to it that the best is done. This Garden Cities Association, which is particularly interested in the development of the suburbs, should see to the convenience of access and egress for suburban traffic.

Many schemes have been propounded for the improvement of our terminal railways, and a suggestion for taking Charing Cross and Cannon-street Stations across the river, strongly advocated by Mr. Burns, and graphically shown in the *Builder*, is worthy of consideration; but, whilst there is much to be said in favour of such a drastic change, I feel there is another scheme which would offer greater advantages at less cost.

Now that we can construct tube railways, in which run electrified trains, and which are not dependent upon light and ventilation, as in the old days of steam, why not hand over the underground railway, as from Victoria to Cannon-street Stations, to the South London suburban traffic, and construct, in a position much more convenient for local traffic, a tube for the District trains, which will pass where they were always required (and should originally have been), along Victoria-street, Whitehall, the Strand, Bridge-street, Queen Victoria-street, and so connect with its present route at Cannon-street.

Such a new route would be an enormous advantage to the District trains. Suburban traffic from Clapham Junction could then, instead of going into Waterloo, pass over Grosvenor Bridge at Victoria; it could dip into the old underground line; its first stop would be at Charing Cross; it would then stop at Cannon-street, and, by a new line from Cannon-street under Bishopsgate-street to Liverpool-street Station, it could be finally taken out along the East London line under the Thames; and so we should have important through stations along the north bank of the river accessible to all suburban trains from the south. Relieved of suburban traffic, old Charing Cross and Cannon-street Stations could be entirely done away with, together with their hideous bridges. Waterloo and London Bridge Stations could be reserved for the trunk, the mail trains, and the suburban traffic requiring to come into South London. Ultimately Charing Cross Bridge might be re-erected as a new thoroughfare from north to south.

With the destruction of Cannon-street railway bridge, why, then, go to the enormous expense of a new traffic bridge at St. Paul's? Why not utilise the Cannon-street site? It would do more to relieve London Bridge than in a position nearer St. Paul's; tram connexions could at equal cost pass over it through tunnels not only into Aldersgate-street, but also into Finsbury and Whitechapel, and a connexion by train might be made between London Bridge Station and Cannon street district to prevent congestion on the East London line under the Thames.

Distances in London have been halved since the days of the horse 'bus and the horse cab. If Cannon street and Charing Cross were sufficiently convenient in their day, London Bridge and Waterloo are now equally convenient with the motor 'bus and the taxi cab.

In the *Builder* it is suggested that the London, Chatham, and Dover line from Holborn should be taken underground and under the river. If this could be realised all the bridges in central London would disappear. What a glorious prospect! All dependent upon the annihilation of petty interests and upon amalgamation. The South London line should purchase the old Underground at the cost of a new section of tube for the Circle line. The benefits that they would thus derive from the improved facilities they would thus be able to provide for suburban residents in the south of London would be enormous.

I put this forward as a tentative suggestion of what might be done to improve London's railways at small cost and to get rid of the hideous bridges over the Thames.

London has recently constructed Kingsway, and it is yet early to calculate the benefits that are to be derived. Other new thoroughfares need yet to be constructed through the slums. An embankment needs continuing along the south bank. Many street widenings need taking in hand, and enormous areas of cottage property need rebuilding to modern conditions. But of all things most pressing at the moment is the treatment of the bridges and of the suburban lines."

The paper will be discussed at a future meeting.

CIVIC DESIGN NOTES.

Garden City, Montreal. A SCHEME promulgated by the Canadian Northern Railway Company embraces the planning and development of a garden city, for groups of detached and semi-detached villas, upon the island of Montreal between Back River and Outrement. The various properties required have been purchased, together with additional land to the west, which, it is anticipated, will be utilised for the erection of factories and the new yards of the railway company.

Portsmouth and Town Planning. AT a recent meeting of the Portsmouth and District Building Trades Association Mr. W. Rogers, architect, and an hon. member of the association, dealt with the subject of Town Planning. Our towns and cities, he said, had been built in a shapeless, go-as-you-please, planless way, with the result that we had slums and congested areas, physical and moral deterioration of the people, and making that statement he spoke more particularly in respect to Portsmouth to the time anterior to the passing of the Public Health Act.

Considering upon non-Utopian lines the recent proposals to adopt schemes for town planning the undeveloped land in Portsmouth, he observed that modern requirements demanded that the principal routes of the thoroughfare should be of ample width and that their direction was of the greatest import.

The lecturer gave some statistics as to the area of land available for town planning. The area of the county borough was 6,573 acres. Approximately there were already 2,890 acres built upon, and 1,733 acres devoted for public purposes (such as the Great Salterns, the Dockyard, the Asylum, the cemeteries). This left a total of 1,950 acres available for building, but of this total the War Office held 800 acres, and if this was deleted only 1,120 acres would be left to the town plan. It was estimated that 810 houses were being erected every year in Portsmouth. Accepting these figures and allowing forty-five houses per acre, 18 acres were built over in the year. Now if they worked under town planning, with a maximum of thirty houses per acre, allowing 1,000 houses annually, they would then be using up 33½ acres each year. Now, having 1,120 acres available, it would require little more than thirty-three years to develop the land, or, if the War Office land be included, it would take fifty-eight and a half years to build over the whole undeveloped land.

He declared that if no reduction of the price of land was made no considerable relaxation of by-laws, by allowing narrow footpaths to side roads, etc., could compensate the builder for the extra cost of land per house, and he could see no method which would enable detached or semi-detached houses to be built as cheaply as terrace houses. The average cost of land per foot frontage was 4*l*. 10s. A builder, buying 100 ft., built seven houses upon the land, and sold at 280*l*. each. Now, under town planning, if only allowed to build five houses, the builder must either buy his land for 126*l*. less or sell his houses for 305*l*. each. The question therefore was, Would the purchaser give the extra amount for the same accommodation as he had now? These were highly practical questions, and he commended them to the consideration of the Association.

The Saving of Kingston Vale.

AT a recent meeting of the London Committee of the Wimbledon and Putney Commons Extension Fund arrangements were made for personal appeals to representatives of the public spirit of the City to provide the balance necessary for carrying out the purpose of the fund. Probably 7,000*l*. will suffice. The Committee point out that the residents near the Common pay for the whole cost of acquisition and maintenance, whereas the other great open spaces of London were almost wholly acquired and are wholly maintained at the cost of the Corporation of London or of the metropolitan rates. It would have been reasonable, they contend, that London at large should have provided the extra sum necessary.

Edinburgh Improvement Projects.

FOR some time, says the *Scotsman*, there has been a growing feeling that the full value of the East Princes-street Gardens is not realised under the present arrangements. The gardens during the season, when the flowers are in bloom and the temperature is mild, can be enjoyed by those who have leisure to enter them; but the full possibilities of their situation are not taken advantage of in respect of the much larger number of persons who pass along Princes-street. The high railings which separate the gardens from the thoroughfare form an effective barrier, not only to free passage, but also in a large measure to the view. The proposal to remove the railings has been before the Town Council for some time; and a sub-committee of the Public Parks Committee has agreed upon a definite recommendation in regard to the subject. It is proposed to make a number of alterations on the laying-out of the East Princes-street Gardens with a view to the plateau being thrown open. The actual removal of the railings it is proposed to defer for a year, and in the meantime to increase the number of entrances, and to keep the gardens open until midnight. The experience so gained will enable the Town Council to come to a decision as to the complete removal of the railings. A large model of the gardens, showing the proposed alterations and the position of the new entrances, was placed before the Sub-Committee by Mr. M'Hattie, the Chief Gardener. A footpath is to be formed along the inside of the railings the full length of the gardens. Other arrangements are to be carried out. Another project discussed was the improvement and popularising of the Calton Hill. After consideration of various suggestions that have been made, it was remitted to the City Superintendent of Works, the City Road Surveyor, and the City Gardener to draw up a report with regard to the improvement of the Waterloo-place approach, the widening of the roads and footpaths, additional seats and their location, the improvement of the greens, the advisability of removing the railing round the National Monument, the selection of suitable sites for monuments, and the closing or better lighting of the Hill at night

The Housing Problem.

EARL GREY, speaking at the annual meeting of the York Health and Housing Reform Association, said he was too old a reformer to be so sanguine as to believe that we could abolish the slum, but he did believe that if the people of England were to determine that a ring fence should be built round existing slums, and that in all urban developments the slum should not be allowed to take root, we should do a great deal for the future prosperity and benefit of the country. The Dean of Lincoln said that the slum arose from a variety of causes, and was not going to be abolished by a fairy's wand. Nor could it be dealt with by one method alone. We should be obliged not merely to treat it as a housing question, but to go along all the lines of social improvement at the same time. We wanted more houses before we could shut up the bad ones that existed. A clearance scheme did not solve the question. Wise sanitary authorities would therefore have their town-planning and extension schemes before them when they contemplated closing slum property, for otherwise the closing of one slum would only create another. It was not enough to enforce sanitary laws; we must bring owners of small tenements to realise their responsibility.

The View from Richmond Hill.

UNDER the provisions of the Town Planning Act a public meeting was held on the 19th ult. at the District Council offices, Ham Common, to consider the proposal of the local authority to apply to the Local Government Board for sanction to a scheme designed to preserve the amenities of the district, and particularly the views from Richmond Hill and the river. Mr. A. R. Fowler, Chairman of the District Council, presided, and explained that the whole of the Parish of Ham and part of Petersham would be included in the scheme, which would therefore amply protect the view from Richmond Hill and also the view from the Thames. If the suggestion of the Twickenham District Council to get a new bridge built over the river from Eel Pie Island materialised, then the Ham Council would have to construct a connecting road from the bridge to the existing main road. Personally, he would rather retain the present rural character of the village, but he was afraid that would be impossible. Major D. P. Chapman elicited the fact that the scheme would not conflict with the proposals already made by Richmond and Twickenham, but would be promoted in harmony with them.

Newcastle-on-Tyne Town-Planning Scheme.

NEWCASTLE Corporation's application for permission to prepare a scheme of town planning for land known as Craghall Dene, situated within the city boundary, and partly in the urban district at Gosforth, formed the subject of a Local Government Board inquiry, conducted by Mr. Thomas Adams, at the Newcastle Town Hall. The City Engineer, Mr. Steele, presented statistics dealing with the development of the district. He said he saw signs of immediate building operations on the area included in the scheme, and the whole district was in such a part of Newcastle as was likely to be developed. He declined to commit himself to the belief that the development of the Gosforth portion of the estate was on such lines that it was not necessary to include it in this scheme, and he could not agree that the making of a road along the railway would dispose of the question of communication.

ETON CLOISTERS.

MR. H. E. LUXMOORE writes to th from Eton as to the discussion l about the removal of the old railings west of the Eton College Cloisters. He "It ought to be known that it is now to remove also the railings from th and east cloisters; solely on the grou it would 'look better' without th that they are additions to the structure. As this has been decid consideration and experiment, it seem to repeat arguments against it; no protest likely to prevent it. But yo possibly help to prevent further chang made to suit the ever-varying taste day, if you would allow those w strongly about it to advocate once m principle which we think ought to such cases. When work has been done by our forefathers to the best power with good material, the questi longer whether we 'like' it or not, become a part of history, not a 'm taste.' Practical needs may, of course reluctant alteration or removal; othe are bound to preserve and protect it, we are owners, and much more if, case of a public building or nationa ment, we are only trustees for futu In such a case private taste ought no weight, and least of all ought it to itself at the expense of the very tru which it administers. For indeed taste is nowadays too capricious t against history. Inigo Jones co Gothic; Wyatville restored it; Sir Scott condemned Georgian alteratio deplore Sir Gilbert Scott's, and t generation will often deplore ours."

Mr. A. C. Benson, writing from M College, Cambridge, in reference to M moore's letter says:—"The use of t "railings" in the controversy has c concealed from many old Etonians actually in progress. What are being are in no sense railings, but the screc their tall solid balusters of Sussex iron across the Cloister arches in 1725. nothing particular to see when these a away, nothing that you cannot perfe see through them and above them. cool and pretty place, that cloiste summer afternoon, with the glimpse little court and the green garth, laurels and quaint old pump; and taki the grille, two centuries old, so costl solid, which does not hide anyth interfere with anything, is just one annoying bits of fidgety restlessn inability to leave things alone, so c istic of active officialdom.

Eton, of all places in the world, mi learnt the lesson not to meddle w antiquities. In 1847 the splendid woodwork was ruthlessly torn dow Chapel—you can see a picture discarded organ-case, now at Rugeley Ralph Nevill's book, "Floreat Etona" was discovered that the stalls h erected over the XVth-century which were still visible, and in ve preservation, on the walls behind.

What did Eton taste proceed to de to destroy the greater part of these paintings, then to cover the rest some very monotonous and insipid stalls! My only terror is that the come when it will be proposed to remo in their turn. It is strange that cannot see that "taste" is the mo and unreliable thing in the world, the irrecoverable and irreplaceable that which is given to all costly, care solid work by age and weather, by tradition and association. Vandalism enough anywhere; but at Eton, where tion after generation of English boys, most impressionable years, get to lov wall and window and gable with an romantic affection, it is really too u to play tricks with the place in the futile archæology and private taste."

Mr. Benson has contributed an ar much the same effect in the colum contemporary, and both he and M moore give expression to opinions wh we believe, be endorsed by all who b the preservation of "work carefully our forefathers to the best of thei with good materials."

THE BUILDING TRADE.

ADE UNIONS AND THE MINIMUM WAGE.

view of the unfortunate strike of the miners, correspondents are writing to he Press pointing out to the coal- that, after all, the concession of mum wage is a comparatively small o demand and that the men can well sted to give a minimum return of in return for a minimum wage. This nt is as novel as it is unsound, and, er, it entirely loses sight of modern ial conditions.

ideal to be attained is not a mini- age with a minimum return, but an ely fair wage and a maximum return t fair wage. That is the ideal, and n employer employs but one or two s the ideal is more or less attained. evant is engaged at fair wages, and he gives satisfactory work in return sily dismissed and his place is taken ore worthy subject. But where large of men are employed and the trade intervene the position is totally dif- If a minimum wage be fixed, quite om the results attained, the employer neans of securing that each man will adequate return for his pay. The l of a single man—after even his from one working place to another—ted by the unions, and in past experi- s often been made the sole pretext strike. Under such conditions the on of a minimum wage deprives the r of any means of securing from mployee an adequate return for the aid to him. A correspondent in these recently pointed out that there was fication for the oft-repeated assertion e trade unions acted in restraint of limiting the number of bricks which man might lay in a day. In this ar instance, we believe that our corre- t was correct in stating that, at any vadays, no such rule exists, but a nimum wage for all, entirely irre- of capacity, zeal, or actual results, is precisely the same in principle as e suggested limit on output? It is ng down and a discouragement to e and capacity. Hitherto, supply and have had something to do with tes of wages; in certain industries bour is unorganised and workpeople nceless it has worked injustice, and Parliament has intervened to remedy . But in the case of the very best d trade in the world any interference employer and employed is to be ed, and the fixing of minimum or n wages would appear to be an im- y having regard to the complex s of commerce and the limit of ompetition.

ON MASTER BUILDERS' ASSOCIATION:

ANNUAL DINNER.

nnual dinner of the London Master Association was held on Thursday r in the Whitehall Rooms, Hôtel e, Charing Cross, Mr. G. Bird God- sident in the chair. There were esent, Mr. W. Edgar Horne, resident of the Surveyors' Insti- Mr. W. E. Riley, Superintending of the L.C.C.; Mr. James S. Holli- sident Institute of Builders; Col. rd Trollope, V.D.; Mr. F. Corben, London Association of Master ons; Mr. J. Arscott Bartrum, the Tylers' and Bricklayers' Com- d Messrs.

The loyal toasts having been proposed and honoured,

Mr. James S. Holliday,

President of the Institute of Builders, proposed the toast of "The Architects and Surveyors." He said there had been great changes in the building trade and the profession of architecture during the last fifty years, and comparisons that were made at times were not always favourable. When the history of our time is written, however, our buildings will be found to compare favourably not only in architectural merit, but also in stability with those works of other periods. Sometimes we heard that work was not so well carried out, and if the public would have cheap and nasty articles, there would always be a supply; but if best buildings were wanted, experienced architects and builders would always be found to supply them. We heard of builders, and even architects, who were not fully educated. He supposed there were cases of the kind, but he thought there was a growing disposition to place too much importance on academical qualifications, and that was one of our present-day troubles. He was glad that the London builders were trying to reinstate the old apprenticeship system, for after a long experience in the trade he had come to the conclusion that one could not become proficient merely by attending classes. A practical basis was necessary. One of the great changes in the building trade was reinforced concrete. Just lately the L.C.C. had framed new rules and onerous conditions, and he was wondering what would be the next requirement. Having made some humorous observations as to possible requirements in regard to aviation, the speaker referred to the work of quantity surveyors, and coupled with the toast the names of Mr. Simpson and Mr. Horne.

Mr. J. W. Simpson,

in replying for the architects, said the craft of the builder was a very ancient and a very honourable one. The trade was one to which we were all proud to belong. He said "we," for the architect was by the very derivation of his title a master builder, and they were once all jacks of the same trade. He sometimes wished we were so still. Yet, despite their inevitable division into special groupings (a division which tends to split continually into sub-divisions, and these into mere details), the one contriving and designing the building proposed, and the other devoting its admirable administrative genius to its execution, they still, he was glad to say, kept in close touch and had very friendly relations. He had thought of claiming the description "the perfection of common sense" as appropriate to the art of building, but he remembered that an authority, "Joseph Vance," who, if he did not actually exist, was none the less very lifelike, said that "builders know nothing of buildin', and no need to neither." No one who visited one of our great modern buildings during its erection and observed the simple and admirable routine which had been brought to such perfection was likely to agree with Joseph Vance, and they would recollect that he himself did really know a great deal about building. Despite the alterations in the conditions of labour and the education of the workmen—some of which we regretted, and with others of which we sympathised—the work of our craftsmen was no whit behind that of earlier days when occasion was given to them to produce it. Time was of more value daily, and the finest work demanded both time and thought. It was by the close and kindly relations of the builder and the architect that time might be saved without detriment to the result of their joint labours.

Mr. W. Edgar Horne, M.P.,

in replying for the surveyors, first referred to the death of Mr. T. M. Rickman, F.S.A., one of the members of Council of the Surveyors' Institution, and said he was a man for whom everyone must have had the greatest respect. Mr. Holliday referred to the architect as the source of all their work, but he was nothing of the kind, whereas the client was, and the client was a person surveyors had to look after. Mr. Holliday also said that theoretical knowledge was all very well, but it had to be from a practical basis; practical basis translated meant client. At the end of last year he (the speaker) made some observations upon the growth of London. He was able to obtain some very interesting figures and facts, and he had come to the conclusion that London is not now growing at the rate at which it ought to. Very few of us recognise the enormous size of London, and every year there was a wastage of the buildings by their having outlived their usefulness, and that wastage had to be made good, and he believed it was just about made good. London was not growing, as a whole, as fast as it should, and we were not having the large improvements which we should have—the comprehensive designs which London was entitled to. At Budapest there were more fine buildings being put up than in London, and that was partly because the pressure of increased rates and taxes had been taken off speculators, clients, or capitalists who invested their money in new buildings, and it was important to London that capitalists should feel security when they put their money in bricks and mortar, and there was not that security felt now. London was the centre to which millions of people came every year to spend money, and it must be made desirable and convenient for them to do so, and that would be better for London. He believed it was

only by a liberal and forward policy of improvements and rebuilding, etc., that we could have a London which would be worthy of the city we are all so proud of.

Mr. Fred Higgs,
in proposing the toast of "The L.C.C. and Municipal Authorities," enumerated the various ways in which the many municipal authorities of London look after the citizens, and also to the relations of the builders with the various authorities. He thought there had been great improvement in municipal government in London during the last twenty years.

Mr. W. E. Riley,
Superintending Architect of the L.C.C., in reply, said of the two City Councils and the twenty-seven Borough Councils of the County of London he did not know much at first hand, but he had no doubt that the problems connected with the building trade with which they had to deal presented the same difficulties as those at Spring-gardens. One of the most important, if not the most important, of the many responsibilities devolving on the County Council and the local authorities was that of the erection and regulation of buildings. He was quite sure that all the councils and their officers were equally anxious to do what was fair so far as they could judge as between the builders and the ratepayers. As regards the London Building Acts, it was the constant endeavour of the London County Council to limit and amend these Acts in any way that modern requirements and recent improvements in building construction might demand. The County Council and municipal authorities not only required builders to know all about materials and construction, but expected them to know all about the laws which they had to administer. The builders' lot in London was "not a happy one," and any endeavour to ease his path was praiseworthy. The greater stringency of building codes in other large cities usually escaped attention when the fate of the London builder was depicted in gloomy tints. As to efforts which have recently been made to remove some of the restrictions which were felt to press hardly on building in London, in 1908 the County Council were able to obtain amendments of the London Building Act which removed the limit of cubical extent in buildings, and considerably relaxed the rules as to uniting buildings, and this relief was one which, he believed, had been much appreciated by building owners in the metropolis. In 1909 the Council secured a further amendment of the Building Acts to permit the erection of steel-framed buildings, and to enable regulations to be made with respect to buildings of reinforced concrete construction. These regulations would, it was hoped, shortly become part of the building code of London, and they had been drafted with the single object of informing a builder definitely as to where he stands. As regards the City and Borough Councils, their relations towards builders were more on the lines of inspection. But whatever duties were placed on the authorities bearing upon builders' work he was sure that all of them were only too anxious to do all that they could to administer their powers with as much regard as possible to builders' interests. The municipal authorities of London, in conjunction with builders, were occupied with big things. Large buildings of all kinds were being erected by the L.C.C. in every quarter of London, particularly for educational purposes. As regards the special and technical institutes which were springing up everywhere, not only did builders get work put in their way, but the very object of the institutes was to provide technical education for the rising generation.

Mr. F. M. Elgood,
in proposing the toast of "The London Master Builders' Association and its President," referred to the importance of the calling of the master builder and to the position of the Association. He also spoke of the Housing and Town Planning Act, which gave power to responsible authorities to relax building regulations without the formal necessity of going to Parliament. The Act had far-reaching possibilities, and, in regard to town planning, it was important to look into the future and to prepare comprehensive schemes. One of the most important works of the Association was in reference to Conciliation Boards, and it was greatly to the credit of the Association that in these days of labour unrest that there should have been such a long peace in the trade.

The President,
in reply, said the future of the trade seemed brighter. Trade had improved—there was plenty of room for it—but prices had not recovered, and was that not a great deal to do with themselves? Was not the fault that, having arrived at the sum of the tender, they took off a good discount? And he urged them to try and reduce that discount instead of increasing it. There was no need for the extreme competition which prevailed. During the past year it had been well with the Association, and there had been more additions to their ranks than for several years past, several important firms having thrown in their lot with the Association, thereby helping to bring about that unity which was so essential to the trade, and members would do well to push forward this work of organisation. Individual members could do much by trying to get those outside to join, and in this connexion he stated, as an illustration of the difficulties they had to contend with, that a well-known firm, after the advantages of unity had been specially pointed out, said, "We have talked about becoming members, but we understand there is likely to be trouble with the carpenters, and it may answer our purpose to accede to their wishes, and we should not be able to do so if we were members of the Association." As to labour unrest, in some parts of the country it had affected the building trade, but London so far had escaped; but probably all of them were aware that the Amalgamated Society of Carpenters and Joiners had given notice to terminate the rules which now exist, and they had put forward proposals, but, unfortunately, on to the proposed rules they had tacked on the Furnishing and Cabinet Trade Society, and that the Council could not accept, as cabinet-makers could not be regarded as part of the building trade. The Amalgamated Society proposed 1s. per hour for an eight-hour day; night gangs which, at the present time, are paid at the day rate of wages plus one penny per hour, they propose should be at time and a quarter. All overtime shall, in future, be paid for as double time, instead of time and a quarter, time and a half, and double time, and he was sure all must recognise that these propositions were most unreasonable. The building trade could not stand such proposals as that. What the Association agreed to would have to be accepted by the building owner, and architects and surveyors would agree that if any such proposals were agreed to the building trade would be crippled for a very long time to come. If they were to have trouble, they must be united; what the Council decided was for the best, and must be supported by all of them. The President then referred to other troubles the Association had had to face during the past year, such as the Insurance Bill and other legislation.

The last toast was "Our Guests," proposed by Col. Trollope and acknowledged by Mr. H. T. A. Chidgey, Q.S.A.

A CAMPAIGN AGAINST LABOUR TYRANNY.

IN view of the feeling in favour of the repeal or amendment of the Trade Disputes Act, 1906, the Council of the Liberty and Property Defence League invites the co-operation of all those who desire to safeguard the freedom of labour and the interests of the public against "peaceful persuasion" in a national demand for the alteration of the law. The Council of the League suggests that public petitions in terms similar to the resolutions adopted by the justices of Liverpool and other places should be placed for signature in all parts of the country, and these should be sent, when complete, to local members of Parliament for presentation in the House of Commons. The Council also suggests that wherever practicable public meetings should be held in support of an amendment of the law, and that the question should be raised at political meetings, at which either a member or a Parliamentary candidate is present. It is believed that by these means the true feeling of the country may be demonstrated and Parliament moved to action. Communications may be addressed to the offices of the League, 25, Victoria-street, Westminster.

THE PROVIDENT INSTITU OF BUILDERS' FORE AND CLERKS OF WOR

THE twenty-eighth annual dinner Institution was held on Saturday last Holborn Restaurant. The chair was t Sir Aston Webb, C.V.O., C.B., R.A., supported by Sir A. Brumwell Thom John Slater, F.R.I.B.A., Mr. G. C Mr. Thos Costigan, Mr. Alexander and Mr. Leonard Horner.

The loyal toast having been h

The Chairman,
in proposing the toast of the Provident tion of Builders' Foremen and Cl Works, said that it was a noble duty to support the Institution, and he wi had the silver tongue to draw the s and every bawbee from their pockets. thought that, as compared with past ye foremen and clerks of works were better salaries at the present day, they deserved more, and he hoped young men would join the Institution, ally those who were connected with th ing trade.

Mr. T. Costigan,
in reply, said that the Institution want all to be strong men to support their i Master builders and other employer know when their liabilities are at an e as the Secretary of the London Builders' Association, had received serious letters from old subscribers to they could not renew their subscription to the increased taxation which was sti put upon them.

Mr. F. J. Dove, in proposing the the "Architects and Surveyors," sa what was wanted among builders wa much what is called "trade unionis "combination."

Mr. John Slater and Mr. H. T. A. having replied,

The Chairman
proposed the toast of the "Builders a tractors," and in the course of his said that he understood the term "bu but why "contractors"? He much p the old style of "builder," and he was to say that during the whole of his c with builders he had never had any dispute with one of them. Every thought, knew the A B C of build architect, builder, and client; and he s that the builder was the middlema first qualifications of a builder sh "imagination," and he should also the gifts of organising, management, being able to say "No!" He tho were being over-legislated. We ough able to manage our own affairs, an already had the House of Lords in su he thought it would be a very good we could have the House of Comm suspension for a time.

Mr. Leon rd Horner,
in reply, referred to the most depress tion of the building trade and to sideration of the architects and surveyors to the builders, and he c help saying that the builders had the foremen and clerks of works for the which they had always shown.

The toast of "The Governors, Donors, Subscribers, and Visitors" been proposed by Mr. Alexander Rito replied to by Mr. T. Costigan and Mills Robbins.

Mr. G. Corderoy proposed "The Cha who, in response, said that it gave hi pleasure to be there, and he wished the tion and its work every success.

BUILDERS' CLERKS' BENEVO INSTITUTION.

THE annual general meeting of this tion took place on the 27th ult., Mr. W. Trollope, President, in the chair.

The Report and balance sheet were su to the donors and subscribers. They the income from donations, subscr dividends, etc., was about 780*l.*, and fr amount the sum of 758*l.* 15s. was annual pensions, and 5*l.* granted as ten relief. The late Mr. John Howard C 270*l.* to the Institution, which was for the purchase of a presentation Orphan Working School.

Mr. Howard Trollope was very thanked for his excellent services dur past year, and Mr. Dudley Bartlett, w inducted to the chair, received a hearty w

The Committee hopes to gain s support to make the receipts cover the e ture, and Mr. Dudley Bartlett is working hard to achieve this.

THE YORKSHIRE ERATION OF BUILDING TRADES' EMPLOYERS.

annual meeting of the Yorkshire tion of Building Trades' Employers was Hull on the 15th ult., when the Mayor (Alderman Feldman) gave a elcome in the absence, through illness, Mayor (Mr. T. Taylor). There were enty members present, including Mr. nsley (Hull), President; Councillor Mallinson (Huddersfield), Vice-Presi- Mr. W. T. Ledgard (Leeds), Vice-Presi Ir. T. E. Taylor (Bradford), Treasurer; an W. H. Jessop (Huddersfield), J. Dawson (Huddersfield), W. Sinclair rough), W. R. Thompson (Dewsbury), Rhodes (Leeds), Past-Presidents; Mr. dson, Secretary, and others.

man Feldman, in giving the members al welcome, said he noted with regret e Federation report took rather a view of the future. Might he offer a ds of encouragement by saying that gress of municipalities tended in a neasure to the extension of building s, and modern conditions rendered it ly essential that new buildings should e and take the places of the old ones. c, he thought they might with perfect ook forward to a bright and hopeful

ecretary reported that he had received teen towns forms of protest, containing atures, against the undue haste with he Insurance Bill had been rushed Parliament, contrary to the definite of the Chancellor of the Exchequer. White, Secretary of the National on, suggested that they should have otest backed by the Northern and ntres, and then forward it to the Executive for presentation.

as agreed to, after several members plained of the apathy shown by local ons. Mr. Lindley asked if it was sible to have a report upon the e Act, setting out in simple terms ions affecting the trade. The Presi lied that there are many books pub- n the subject, most of them good.

nference nominated the President as presentative on the National Health Commission. It was agreed to hold meeting at Huddersfield.

discussion took place on the question uctual referees, raised in connexion Huddersfield Corporation. Several pointed out that it would be advis- sign no agreement which did not a clause for the appointment of an nt arbitrator in place of the Borough

dinner in the evening the President orted by the Lord Mayor of Leeds, r of Grimsby, the Sheriff of Hull n Brown), Mr. E. Bolton (President full Chamber of Commerce), Mr. ddison (President National Federa- Slate Merchants), and others. The ror of Leeds, replying to the toast of ests," submitted by Mr. Finch, said ng his experience, which extended y years, he had not known the build- so bad for so many consecutive e thought there were signs of a ast year, but through lack of con- the country and by reason of a mount of legislation, there was a He was, however, optimistic, and d the cloud was passing. He had re was a question looming ahead pelling non union men to join the l he would say was that if the position rsed and employers insisted upon only non-union men it would be nny.

ison proposed the Yorkshire Federa- ilding Trades' Employers, and, in the President said the trade's peace tened, and what might happen e next few months could be only l. The present state of trade cer- i not warrant any threatening n the part of labour. He was a ver in conciliation, but Conciliation d not worked exactly as they were Mr. Cheverton-Brown proposed the Trade of Hull, Mr. Edward Bolton eriff replying.

BATH MASTER BUILDERS' ASSOCIATION.

The annual dinner of the Bath Master Builders' Association was held on the 14th ult. at Fortt's Restaurant, the President (Mr. W. A. Sheppard) in the chair. Among the company were the Lord Mayor of Bristol (Mr. C. W. Wills), the Mayor of Bath (Mr. T. F. Plowman), Mr. Audley Perkins (President of the Bristol Master Builders' Association), Mr. E. F. Woodward (Vice-President, Bristol Master Builders' Association), Mr. J. Bertram Wills, Mr. C. Cowlin, Mr. E. J. Neale, and Mr. H. H. Lloyd (Bristol).

The Lord Mayor of Bristol proposed "The Mayor and Corporation of the City of Bath." The Mayor and Alderman Oliver replied.

The Mayor of Bath, on rising to give "The Bath Master Builders' Association," said the Association had the very laudable object in view of promoting conciliation, and, instead of being a party to resorting to the brutal expedient of strikes and lock-outs, did its best to bring masters and men together, and promote a condition of things more conducive to the welfare of both. He was glad to learn that the condition of the building trade during last year had shown a distinct improvement upon the previous year, and, as far as Bath was concerned, he could not help thinking that was attributable not to the Corporation but to private firms. One could not walk along the street without seeing how much had been done by the various firms of the city in the way of enlarging or improving.

The President, in his response, said questions of wages, time-clauses in public and other contracts, and all manner of questions affecting the building and contracting trades were constantly brought up for discussion, and dealt with as they thought best, and what had struck him while he had been in office was the kindly and sympathetic way in which all questions affecting wages were looked at and discussed by the Association. In these times of keen competition nothing could be given away, but all the questions of wages had been viewed most fairly and sympathetically by all members of the Association, and that spoke well for the future relations between masters and men.

The Vice-President (Mr. F. C. Chancellor) gave "The National and South Western Federation of Master Builders of Great Britain and Ireland," congratulating them upon the amount of active work they had been able to do.

Mr. James Wright (President of the National Federation), referring, in reply, to the labour unrest in the country, said he advised the members that it was better to look after their own forces and close up their own ranks and strengthen their own organisation, so as to be able to deal with labour difficulties as they arose all the more effectively. That was essential from his point of view, for the National Federation could not be strong unless their local associations were successful. During the three or four years the Federation had been very actively engaged in the interests of the members. One of the matters upon which they had been engaging was the National Conciliation Board. While he did not claim for it that it would settle everything, it was based on such sound and common sense principles that if employers and workmen would only be faithful to the principles upon which it was based, and loyal to the decisions arrived at, nothing but good could come out of the scheme for both workmen and employers. They had arranged an important Conference with the Board of Trade on the subject of the Insurance Act, especially in regard to that part concerning unemployment, which affected the building trade especially. Mr. White had found nineteen clauses in the second part of the Act which were very objectionable from their point of view, and which would be very irksome. But as a result of the Conference they got some distinct advantages in thirteen of these cases. One thing he was particularly entitled to claim their consideration for, viz., that the Federation was mainly instrumental in getting indentured apprentices exempted from that portion of the Act. Another clause was in reference to sympathetic strikes. The President of the Board of Trade had recognised on their representation that the clause was much too widely worded, and in consequence of what they said it had been decided that workmen out because of a sympathetic strike or lock-out could not claim unemployed benefit. They were now concerned with the Workmen's Compensation Act, the administration of which they considered very expensive, because for every 100*l.* that went to an injured man they had to pay 150*l.* premium. They were going to try and get the administration of the Act simplified, and it was suggested—and a number of unions were in sympathy with them—that the Government should supply a medical referee to sit with the County Court judge, and save present expenses which were incurred.

Mr. A. J. White, the Secretary of the National Federation, also replied, saying regretfully that he was afraid the building trade was not in for such a peaceful time as they had had. A strike had unfortunately started in a section of their trade at Bristol, that day, and in the present temper of the workmen it was quite possible that the whole of the trade would come out in sympathy.

Mr. C. H. Long proposed the toast of "The Architects, Engineers, and Surveyors."

Alderman T. B. Silcock acknowledged the compliment.

Mr. A. W. Wills gave "Kindred Associations, Hon. Members, and Visitors," and in doing so remarked that the day had passed when men endeavoured to carry on their trade as units. In the old days it was the practice with men engaged in the same trade to be at an enmity with other men similarly engaged, but now good feeling existed because they felt they had common interests. There were a number of members outside that Association who reaped the benefits of what those inside had done, and they did feel that those outside should do their proper share.

Mr. Audley Perkins, the President of the Bristol Master Builders' Association, whose name was coupled with the toast, spoke regretfully of the strike in Bristol, which had been forced upon them.

Mr. H. W. Matthews also replied.

GENERAL BUILDING NEWS.

NEW PREMISES, LONDON.

Messrs. Harisons & Crossfields' new premises in Great Tower-street have been erected from the designs of Mr. Edgar Stones, architect. The building is of nine floors with 200 rooms, all equipped with modern appliances, and is one of the first buildings to be erected with a steelwork skeleton cased in fireproof material. The builders were Messrs. Walter Lawrence & Son, of Finsbury.

BACON CURING ESTABLISHMENT, HITCHIN.

The preliminary arrangements in connexion with the formation of a bacon-curing establishment at Hitchin have been completed, and the plans and specifications for the new undertaking, which have been prepared by Mr. Loudon M. Douglas, F.R.S.E., of 3, Lauder-road, Edinburgh, who is Technical Adviser to the Society, are now ready, and will be issued forthwith, we are informed, to the various contractors who are desirous of tendering for the work of construction.

TRADE NEWS.

Under the direction of Mr. Alfred Bradburn, architect, Bristol, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the theatre, Weston-super-Mare.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Allen for the erecti warehouse at Messrs. A. Boake, Rob Co.'s premises, Carpenter's-road, Stratf plan has been lodged by Messrs. Ember & Co. for the erection of a cinema theatre, Barking-road.

BOOKS.

ombe Church: Architecturally Con-ed.

ier "Branscombe Church, Devon: ecturally Considered" (James G. n, Exeter) Miss Edith K. Prideaux ded one more to the long list of mono- on parish churches which continue to . It would be well if all were done he accuracy and painstaking thorough- hich marks this pamphlet. The writer vledges her indebtedness to previous tions, but points out that recent have brought fresh evidence to light history of the church. An examination fabric reveals four periods of building . Though there is evidence of a pre- st church, nothing of that period now ly remains, and we begin with XIIth Norman work, consisting of a short ith an eastern tower, standing possibly site of the earlier chancel. The XIIIth carried out considerable enlargement church, nearly doubling the nave in and adding transeptal chapels just f the tower and possibly a southern The XIVth century in its turn added chancel east of the tower, and "the entury did not pass without leaving k upon it, mainly, as usual, in the of windows; the large five-light ndow is a very fine specimen of its ft belongs to a date between 1458 and The church possesses a curious in what Dr. Charles Cox pronounces the earliest example of which we re in any English church of an outer to a post-Reformation Gallery." For discussion of the various questions by the structure and a description of gs and monuments we must refer the to Miss Prideaux's scholarly and nodest pages. The pamphlet contains n which the works of various periods erentiated by hatchings and thirty- hotographs. It is sold in aid of the gently required for necessary repairs.

ypieces and Ingle-Nooks. By. G. AN ROTHERY. Pp. 239, and forty- llustrations. (London: T. Werner e. 6s. net.)

ttle book appears as an addition to use Decoration Series, of which one on Ceilings has already been issued, while others on Staircases, Porchès, Windows, and Antiquities and Curios are promised. Mr. Rothery has evidently gone into his subject in a thorough manner, and, although the use to the professional reader may be questioned of this or indeed any monograph on features which certainly should be treated as parts of a whole, the earlier chapters, in which he discusses the origin and growth of the fireplace as we know it, are very interesting, inasmuch as they bring into the foreground aspects of the methods of the Ancients, which one is apt to pass over as trifling incidentals or matters to be taken for granted. How many people know that the first fireplaces, for instance, with flues of their own, were made in Norman times, and that hitherto smoke escaped only through a hypæthral opening or through doors and windows as best it might, with attendant discomforts, of which so many writers complain? Cheerless hot air—smoke-laden, too, it must have been often enough—and the fume-dispersing brazier sufficed the Greeks and the Romans; the latter a method that, in the shape of stoves, obtains for the most part to-day in all countries save our own. How much he takes for granted, an Englishman realises only when he goes abroad—to miss vital focus-point which an open fire supplies. And because the fireplace is the shrine of the domestic vestals, a chimneypiece the canopy of the altar of the home, it is or should be, the key feature of any room with any pretensions to having been designed. We do not think Mr. Rothery has sufficiently emphasised for us the essential æsthetic of chimneypiece design, which is that the fireplace should express both its quality of a part specifically fireproof, and, equally important, as fulfilling a function which carries it upward to the ceiling and beyond. He seems, if we are to judge from some modern examples he illustrates—notably one or two little brick designs by Mr. Winter Rose—to be aware of the first condition to forgetfulness of the second. A good test is that a chimneypiece cannot by the imaginary increase of its sides be thought of as a door lintel and jambs. However, it is a pleasing book, with many good illustrations, with a bibliography, and well indexed. We look forward to others of the series.

The House and its Equipment. Edited by LAWRENCE WEAVER. (London: Geo. Newnes, Ltd. 1911. 15s. net.)

THIS volume comprises a number of useful contributions reprinted from the pages of *Country Life*, covering a wide range of subjects and including a great number of excellent illustrations. Practical questions, such as water supply, sewage treatment, electrical installations, etc., are handled by experts in a manner that makes their general purport quite clear to either the professional man or the layman, while the scope of the book includes all kinds of useful information on the various æsthetic problems connected with the garden, the selection of furniture, etc. There is little in this compilation that would not be of value to one or another; if we venture on a criticism, it is to the effect that sufficient pains do not seem to have been taken to bring the series of articles into some sort of orderly sequence. The matter in itself is good and useful, but in this form of book one looks for some kind of continuity, and it does not suffice to throw a number of articles together in this way without regard to their natural sequence.

Artistic and Decorative Stencilling. By G. A. AUDSLEY and B. AUDSLEY. (G. Allen & Co. 4s. 6d.)

THE name of the authors of this work is well known in connexion with books on ornament and kindred subjects. The present treatise is successful in bringing forward the possibilities of stencilling, which, as an artistic craft, is handicapped by commercial associations. There is no reason why the repetition of a design, which is, of course, the object of the stencil, should not be allied with true decorative intention, and to this end use may be made of the manual before us. Japanese stencils should be studied as object lessons. The authors describe the materials and tools necessary, while the illustrations, some in colours, explain the subject further.

Pilgrim Life in the Middle Ages. By SIDNEY HEATH. With 43 Illustrations. (London: T. Fisher Unwin. Price 10s. 6d. net.)

THE pages of this work afford plenty of evidence of considerable research and selec-

Gothic Work, Milan.

English XVIIth-Century Chimneypiece from Bromley-by-Bow.

(From "Chimneypieces and Ingle-Nooks," by Mr. G. Cadogan Rothery.)

tion, and we can compliment the author upon the compilation of a very interesting volume. The book is "designed to serve and entertain the general reader who is interested in the religious pilgrimages of olden days," and in his 340 pages the author has collected a great deal of information of a general as well as an archæological and architectural character which will serve to make clear the character of pilgrim life in the Middle Ages. The book deals, among other things, with the history of pilgrims from Saxon times, pilgrim costumes, badges, and tokens, papal indulgences, holy wells, flagellants, anchorets and recluses, and shrines and relics.

Ornamental Cement Work. By OLIVER WHEATLEY. (Scott, Greenwood, & Son. 5s.) CEMENT as a medium for the expression of a sculptor's purpose has yet to be exploited. It can be worked easily and permanently, and the decorative uses to which it may be put by a capable craftsman should commend it for consideration. The author himself has carried out some ornamental figures and details in the Greenwich library for Mr. Sydney R. J. Smith, and as a sculptor familiar with all means of architectural decoration his explanations and suggestions with regard to cement may be read with profit.

The Fire Brigade Handbook: A Manual of the Organisation and Equipment of Fire Brigades, for the Use of Volunteer Fire men and Others. By JAMES COMPTON MERRYWEATHER. M.Inst.C.E. (London: Merritt & Hatcher, Ltd., 2, Grocers' Hall-court, Poultry, E.C. Second Edition.)

THE author of this work disclaims any intention of attempting to instruct professional firemen in the performance of their duty, but even to professional men the volume is of value, while to the volunteer fireman it should prove invaluable. It is full of useful hints and advice. It is interesting to note what the author says in the Preface to the second edition of the work, *i.e.*:—"It is a matter for congratulation to all concerned with fire protection that this important public duty is no longer neglected to the same extent that it was twenty-three years ago, and it is with much satisfaction that I am able to record the fact. As a consequence of the increase in the number of fire brigades in this country, and of the greater importance that is now attached to the question of fire protection, many improvements have been made in the appliances provided for the use of firemen. The most valuable is the application of motor power to the fire pump, escape, tender, and chemical engine." The author devotes a chapter to this class of fire appliance.

Pocket Notes and Remembrances for Sanitary Inspectors and all Engaged in Public Health Work. By J. T. COWDEROY. Fourth Edition, revised and enlarged. (London: The Sanitary Publishing Co., Ltd., Fetter-lane, E.C. Price 2s. net.)

THIS useful little book is by the Chief Sanitary Inspector of the Borough of Kidderminster, and it is not surprising to read that the third edition was disposed of in a few months. The object of the author has evidently been to compile a handy little work which can easily be carried in one's pocket, giving facts and information clearly and terseley put of special use to the Sanitary Inspector and those engaged in sanitary health work. The new matter includes Procedure under the Housing and Town Planning Act, Legal Points, and Inspection Regulations, etc. The book includes building terms and medical terms in frequent use.

THE ÆSTHETIC TREATMENT OF CONCRETE.

Mr. H. Shepherd writes in reference to a mistake in our report of his speech at the Concrete Institute (see our last issue, p. 213) as follows:—"What I said was that there was no reason why you should not take ferro-concrete and say this is the structural material on which we wish to put a covering, etc. It was done in the earliest example, I think, we have of Greek art, the Minoan work at 'Knossos,' where the palace walls, built of clay, were covered with plaster, on which figures were modelled. I was, of course, only speaking from memory."

SCIENCE EXAMINATIONS FOR 1911.

THE annual Report just issued by the Board of Education is not only useful for the guidance of students intending to enter for future examinations, but also furnishes information from which the reader may deduce conclusions as to the general proficiency of the candidates who were examined last year.

It appears that candidates are not being well taught in descriptive geometry, being somewhat lacking in knowledge of the fundamental principles, this conclusion being not altogether unexpected in view of recent reports on instruction in this branch of Practical Plane and Solid Geometry. It is satisfactory to note, however, that on the whole the work in both Stages 1 and 2 was satisfactory.

We regret to observe that in Stage 1 of Building Construction the tracings and sketches of details were poor, this class of work being one in which students might reasonably be expected to excel. It seems also that the use of scales is not being taught as it should be. In other respects considerable improvement was shown, particularly in practical knowledge. Candidates in Stage 2 also showed improvement, although the examination results brought to light considerable variations in the efficiency of tuition.

A gratifying feature is the generally satisfactory character of the results in all stages of Pure and Practical Mathematics, subjects which are more and more required in technical work every year.

Theoretical and Applied Mechanics seemed to present difficulties to candidates, a feature due in some cases to inadequate teaching and in others to lack of mental grasp. We regret to read under the head of Materials and Structures that "candidates often wrote lengthy answers without imparting any real information," evidently trying to conceal ignorance under a cloud of words; that "it is a very common fault to confuse internal stress with external forces"; that "the whole subject of shearing stress seems to be much neglected by teachers"; and that many of the answers to the numerical problems "showed that candidates were often sadly deficient in common sense."

These criticisms are rather scathing, and we trust they will not be justified next year.

The answers to a question on the reinforced concrete beam demonstrated undesirable lack of attention on the part of teachers to this form of construction, which should be understood by all students intending to become architects, engineers, or contractors.

Sound, Light, and Heat are subjects intimately associated with architecture, and for this reason it is to be regretted that only in some cases was improvement observed. The general results were either about the same or a little worse than those of preceding years.

As for the remaining subjects, of which only three or four have direct bearing on architectural practice, it may be said that the knowledge exhibited by candidates was encouraging, substantial improvement having been shown in some subjects and maintenance of previous standards in others. The examination in Hygiene was particularly satisfactory, and showed that much knowledge of practical value is being acquired.

The Report is a document which will certainly be appreciated as a guide by those concerned in the work of technical schools and classes recognised under the regulations of the Board of Education.

THE INSTITUTION OF MUNICIPAL ENGINEERS.

AT a meeting of this Institution, held at 4, Southampton-row, W.C., on February 24, a paper by Mr. A. Winter Gray, entitled "Superannuation and Security of Tenure: The National Association of Local Government Officers and Its Bill," was read. In the course of his paper the author says, in referring to the need of superannuation and security of tenure:—"The duties performed by a municipal engineer or surveyor are of a special nature, in many instances carried out under difficult circumstances, and in the face of considerable opposition and prejudice; it is therefore of the utmost importance that adequate protection in the shape of security of tenure should be afforded every officer whose unpleasant duty it is to initiate proceedings against offenders. It is a regrettable fact that, in numerous districts, the municipal engineer or surveyor holds his position at the caprice of political or personal considerations. This lamentable state of affairs is more marked in some of the smaller urban and rural districts, where the surveyors are at the mercy of men whose lack of education and knowledge precludes them from forming any conception (still less appreciation) of the value of the professional man's services. Generally speaking, the remuneration of municipal engineers compares unfavourably with that obtaining in other professions and commercial vocations, notwithstanding a correspondingly high standard of training, skill, and administrative ability is exacted. Invariably he is precluded from augmenting his income by supplementary effort, as the many calls upon his purse in maintaining a social position commensurate with the status and dignity of his office, and in numerous instances precludes the making of adequate provision for his own future and that of his dependents. For these reasons, and for others, the right of superannuation and security of tenure would appear to be incontestable. Only a few weeks ago attention was directed by a service journal to the case of a highways surveyor to an urban district council who was in receipt of the princely stipend of 22s. a week, and who, after considerable argument, was grudgingly granted an increase of 2s. per week, in order that the surveyor's salary might compare favourably with the weekly wage paid to the ordinary labourers.

It should be borne in mind that it is as much to the interest of the ratepayer as of the employé to establish a superannuation scheme. The latter. The officer in possession of a superannuation scheme experiences a sense of security in times of stress and sickness, and this reacts to the advantage of the service."

In regard to unfair competition, the author said:—"If the greatest publicity were given to discreditable cases, much good would result. In this connexion it may suffice to quote one of the latest glaring instances affecting the appointment of a municipal engineer, which reflected the greatest discredit upon the authority concerned.

In November last the council of an urban district in the county of Durham advertised for a surveyor, and received 199 applications for the post. A candidate who wrote for a copy of the duties of the vacant office was, at his request, furnished by the clerk with the names and addresses of the members of the council. The intending candidate, not unnaturally construed this action to be a broad hint to forward a copy of his application and testimonials to each of the members, which he did, and thereby incurred some expense. It was subsequently announced in the Press that the council in question had appointed a local builder as surveyor, in succession to his predecessor at a salary of 250*l.* per annum. The salary was, however, further increased by the fact that the individual appointed was a member of the council, and, as such, received copies of the applications and testimonials of those candidates who sent them to the members.

This is by no means an isolated case of irregularity in regard to the making of appointments."

THE ARCHITECTURAL ASSOCIATION:

THIRD SPRING VISIT.

British Museum.

ON February 17 a very large party of members paid a second visit to the galleries of the British Museum, by kind permission of Mr. J. J. Burnet. On the occasion of the previous visit, two years ago, the first stone of the main cornice had been placed in position; the building is now so far completed externally as to enable its effect to be judged, and the two main exhibition galleries are also in a condition to view, a very good idea of their ultimate effect. The long level lines of the front to Montague-place give a repose which is quite the right expression in a building of this character, and the refined Greek detail (Greek, with knowledge of all that has gone since

eful severity. More fortunate than f our London public buildings, this one properly seen and bears some relation surroundings, from which fact both mmensely. It is only to be hoped that vacant sites on either side of the axial ch are built on this advantage may ruthlessly sacrificed.

e time was devoted to a careful ıation of this front, and the sculptured flanking the central entrance were admired. These have been carved odels by Sir George Frampton, and are tly conventionalised and so perfectly e with the building that it was not ing to hear that they had practically ed unaltered since the original ½-in. levations; they are, in fact, "archi- l lions." Above the main cornice is surmounted by a lead-covered parapet ast enrichments from models by Mr. this work has been excellently done builder's plumber. In the clerk of office two coloured internal perspec- f the new main staircase were ex- showing the proposed treatment in nd white marble with bronze lift en- and painted barrel ceiling. The taircase was next ascended, at present ase only. The sub-ground floor con- public rooms, but the ground floor will eventually be used for museum s, though temporarily intended for orage. It consists of a "nave" and " separated by square piers and run- entire 380-ft. length of the building. ling is coffered with broad flat ribs, complete perspective from end to end n imposing vista. Above this gallery ezzanine for staff and students' use. ıe whole of the top floor is occupied eat top-lighted gallery, which, with galleries over the present north room (united to the extension by the rcase), will at once form a public part nuseum. The great gallery is effec- lanned with ante-rooms cut off by l screens at each end and lighted by skylights, these forming ultimately nexions to the projected further ns. The roof of the main gallery is sly constructed : steel trusses cased in supporting a continuous lantern- low which is a bold cove on either vered externally with asphalt, the the trusses appearing above simi- vered. Where exposed internally es are cased with wood panelling. A to carry a travelling platform for nce in cleaning the roof glazing is l through one end of the skylight that this may be run out of sight in use. The curb of this skylight the longest unbroken line to be seen nterior in London, but the transi- n the ceiling cove by a sort of is not particularly happy.

rty was conducted by Mr. Theodore isted by Messrs. Tait and Whitelaw, contractor, Mr. W. E. Blake, of , who was also present, gave much g information.

E LONDON COUNTY COUNCIL.

ual weekly meeting of the London ouncil was held on Tuesday in the Hall, Spring-gardens, S.W., Mr. E. hairman, presiding.

The Finance Committee recom- and it was agreed, that loans should to borough councils as follows :— 8,305*l.* for paving works and or electricity undertaking; Poplar, paving works.

RTION AND TRANSPORT IN LONDON.— eral Purposes Committee recom- hat a communication be addressed me Minister inquiring whether, as of the consideration given by his Government to the representations ncil in favour of the establishment fic Board for London on the lines in the Report of the Royal Com- ıe Government propose to introduce to give effect to such representa- e purpose of this proposed Traffic o have "some controlling authority the question of locomotion, so closely connected with the provision of housing accommodation, the control of the increasingly congested traffic of London, and other important problems should be referred, and that only such projects as might be approved by this Board should be allowed to be brought before Parliament. After some discussion the recommendation was agreed to.

ENLARGEMENT OF SCHOOL.—It is proposed to provide additional public elementary school accommodation for about 200 children by the enlargement of the Ecclesbourne-road School, Croydon.

IMPROVEMENTS.—Additional office accommodation is to be provided on the girls' floor of the Morden-terrace School, Greenwich, and certain wards at Colney Hatch Asylum are to be improved at an estimated cost of 4,000*l.*

LAW REPORTS.

KING'S BENCH DIVISION : DIVISIONAL COURT.
(Before Justices DARLING and BUCKNILL.)

Hope & Sons, Ltd. *v.* Goode : Building Owners or Contractors? Interesting Appeal.

THIS was an appeal raising a question whether building owners or contractors were liable for the payment of a claim by another firm for work done on the order of the architect, and was decided on Thursday, February 22. The appellants, Messrs. Hope & Sons, Ltd., builders and general contractors, of Lionel-street, Birmingham, asked to have set aside a judgment of the Birmingham County Court Judge.

Mr. Cave, Counsel appearing for the appellants, explained that the claim in the action was for 49*l.*, a small amount, but the question to be decided by the Court was of some importance. It appeared that in March, 1910, the trustees of a Wesleyan Chapel at Coventry (who were the respondents to the appeal) accepted a contract from Mr. Thomas Randall, a builder of Coventry, for alteration to the chapel. The appellants had nothing to do with the contract; but in July, 1910, they were approached by Mr. Crouch, an architect, and asked to tender for certain alterations to the heating apparatus. They quoted 35*l.*, and that offer was accepted, in addition to which other work was accepted at about 14*l.* When the work was completed the appellants received a certificate from the architect and applied to the trustees for payment. The claim was at once repudiated, and appellants told to apply for payment to Mr. Randall, who, it was said, was the contractor for the whole of the alterations. Application was made to Mr. Randall, but payment was refused, and a writ was issued. Then Mr. Randall filed his petition in bankruptcy. The appellants repeated their application to the chapel trustees for payment, but the money was not forthcoming, so action was brought. The County Court Judge held that by applying to Mr. Randall for payment the plaintiffs had set in motion a legal process which debarred them from claiming from the trustees. He gave judgment for the defendants on plaintiffs' claim for 35*l.* for work done to the heating apparatus, and allowed plaintiffs 14*l.* for other items. Counsel argued that the Judge was wrong in holding as he had, for there was no evidence to prove that the appellants had done anything which constituted a release to the defendants from the liability, and, as building owners, to pay the appellants.

Mr. Randall, it appeared, had received the 35*l.* from the trustees, as their agent for the payment of the appellants' claim, but had not paid it. Counsel submitted that that fact did not do away with the appellants' right to sue the trustees as principals.

For the respondents, Mr. Joy argued that the Judge's finding was correct. Although the appellants had not in so many words abandoned their right to claim from the trustees, and agreed to claim from Mr. Randall, they had done so by their conduct, for they were aware of the fact that the trustees had paid the money to Mr. Randall to be forwarded to appellants, yet they had delayed in applying for it.

Delivering his judgment, Mr. Justice Darling said it had been argued that by going to Mr. Randall the appellants had made a second contract with the trustees, which set aside the first contract and made plaintiffs creditors of Mr. Randall and not of the defendants. He came to the conclusion that that was not a substitution of one contract for another, and did not relieve the defendants of their liability to the appellants for the payment of the 35*l.* Therefore the County Court Judge was wrong in his judgment, and the appeal would be allowed with costs, and judgment entered for the appellants for the full amount of their claim.

Mr. Justice Bucknill concurred.

KING'S BENCH DIVISION.
(Before Mr. Justice PHILLIMORE.)

Liability of Builders and Employers : Allen *v.* London Guarantee and Accident Company, Ltd.

THIS action, of great importance to builders and contractors in regard to insurance against claims for compensation for personal injuries caused to people in accidents through the negligence of employees, was heard on February 20, when Mr. Morris Joseph Allen, builder and decorator, of Adelaide-road, Shepherd's Bush, London, proceeded against the London Guarantee and Accident Company, Ltd., of London, in regard to an alleged breach of agreement.

The defendant company denied liability. Mr. Colam appeared for the plaintiff, and the defendant company were represented by Mr. Clavell Salter, K.C., and Mr. Harris.

Opening the case for Mr. Allen, Counsel stated that Mr. Allen had a policy with the defendant company whereby he was indemnified for twelve months against all claims that he might be legally liable to pay as compensation for injuries caused to any person through any horse, or horse-drawn vehicle belonging to plaintiff, or in the charge of any authorised driver in the employment of the plaintiff.

On January 28, 1910, a driver employed by the plaintiff was in charge of a four-wheeled van at Vauxhall Bridge-road, Battersea, and as the result of an accident two men named Turner and Ridsdel were thrown to the ground and injured by the wheels of the van.

Eventually proceedings were taken by Turner and Ridsdel against Mr. Allen to recover compensation for their injuries. The defendant company, in accordance with the terms of the policy, gave instructions respecting the defence of the actions, which were heard before the Lord Chief Justice and a jury, with the result that Turner was awarded 200*l.* and costs, and Ridsdel 175*l.* and costs. The costs were taxed, and subsequently execution was put in on the plaintiff, who in order to save his goods had to pay a sum of about 243*l.*

After the trial of the action the defendant company forwarded to the solicitors to the plaintiff 375*l.*; but it was intimated afterwards that the odd sum of 75*l.* had been paid in mistake, as the total liability of the defendant company under the policy was 300*l.*

Mr. Colam proceeded to argue that as the defendant company had taken over the defence of the actions they could not now recover losses incurred in their efforts to evade liability. They made voluntary payments in order to get a benefit for themselves, viz., the escaping of liability altogether. In regard to the argument as to the liability being limited under the policy to 300*l.*, he submitted that it was for the defendant company to prove that these two claims arose out of "one accident" and "one occurrence."

Mr. Clavell Salter, K.C. (for the defendant company), argued that the policy fixed a limit of 300*l.* as to compensation, costs, charges, and all expenses.

Counsel called the men Kidsdel and Turner, who gave evidence as to the accident, after which his Lordship expressed the opinion that there was "one occurrence," out of which the accidents arose.

Mr. Clavell Salter, in further argument, contended that in no circumstances could more than 300*l.* be recovered. As to the 75*l.* paid in excess, the defendants would not press for the return of that.

Replying to Mr. Salter, Mr. Colam argued that if assured persons under these circumstances were liable to have large bills of costs run up against them without having any means of controlling them, such a contract of indemnity would constitute a burden rather than a benefit. The defendant company were not asked to go and fight the claims, and if they chose to adopt the course the plaintiff could not be held liable in regard to all their costs.

In delivering judgment, his Lordship stated that his view of the contract between the parties was that if the plaintiff defended an action he could not recover from the company more than 300*l.*; but if the company undertook litigation that required the assured to lend his name for the purpose of the litigation, then there arose a common law liability to pay the costs. The plaintiff consequently was entitled to judgment. There would be judgment for the plaintiff for 218*l.* 3s. 3d., with costs.

A stay of execution with a view to an appeal was granted to the defendants.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) a**
advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xx.; Auction Sales, xxvii
Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do
bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will
made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.
The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing
submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while ev
endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

MARCH 9. — **London, E.C.** — NEW OFFICES. - The Port of London Authority invite preliminary sketch designs for new head offices in Trinity-square, and for laying out remainder of land as a building site. See advertisement in issue of November 24 for further particulars.

MARCH 15. — **Drammen, Norway.**—RAILWAY-STATION.—Particulars from the Norges Statsbaner, Christiania.

MARCH 15. — **Prestatyn, North Wales.** — LAYING-OUT ESTATE.—Lord Aberconway and the Trustees of the Prestatyn Estate invite designs for laying-out of the estate Three premiums are offered. Particulars from 33, Henrietta-street, W.C. See advertisement in issue of January 5 for further particulars.

MARCH 16. — **Harrow.** — PUBLIC OFFICES.—The Harrow-on-the-Hill U.D.C. invite tenders for the enlargement of and alterations to their Public Offices. See advertisement in issue of January 5 for further particulars.

MARCH 25.—**Colchester.** SCHOOL.—Limited to architects practising in the borough.

MARCH 30. **Edinburgh.**—MEMORIAL TO KING EDWARD.—Limited. See Competition News, p. 151, February 9.

MARCH 31 **Manitoba, Canada.**—PARLIAMENT BUILDINGS.—The Government of Manitoba invite designs for the new Parliament buildings to be erected in the City of Winnipeg. See advertisement in issue of February 9 for further particulars.

APRIL 4.—**Portland.**—COUNCIL OFFICES.—The Portland U.D.C. invite competitive designs for Council Offices. Premiums of 50*l.* and 10*l.* are offered. See advertisement in issue of February 23 for further particulars.

APRIL 20.—**Birmingham.** —BLUE COAT SCHOOL. —Limited to local architects. Assessors, Mr. G. H. Hunt, F.R.I.B.A., and Mr. C. E. Bateman, F.R.I.B.A. Particulars from the Secretary, the Blue Coat School, Birmingham.

MAY 1—**Rhos Ruabon.**—PAIR OF WORKMEN'S COTTAGES.—Premiums of 10*l.* and 5*l.* Assessor, Mr. Raymond Unwin, F.R.I.B.A. Particulars from Mr. G. Meirion Griffiths, Rhos Ruabon.

MAY 1.—Society of Architects' Travelling Studentship. Design for a Town Hall. 25*l.* and medal.

MAY 1. — **Wombwell.**—SWIMMING BATHS.— The Wombwell U.D.C. invite designs in competition for public swimming baths, to be erected in Hough-lane, Wombwell, Yorkshire. Three prizes of the value of 40*l.*, 30*l.*, and 20*l.* respectively are offered for the designs placed first, second and third respectively by the assessor. See advertisement in issue of February 16 for further particulars.

JUNE 28.—**Hale, Cheshire.**—TOWN PLANNING SCHEME. —Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale.

JULY 1.—**Dusseldorf.** — A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appears on page 365, September 29.

AUGUST 30. — SAXON SWELL PRIZE. — Fifty guineas; with medal, is offered for essay on a hospital subject. Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

NO DATE.—**Pordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in Competition News, December 1, page 635.

* NO DATE.—**Ormskirk.** - CLUB-HOUSE. Competitive plans are invited for proposed club-house for Ormskirk Golf Club. See advertisement in this issue for further particulars

NO DATE. — **Sheffield.** — CRIPPLES' HOME. — Limited to local architects. Mr. E. M. Gibbs, F.R.I.B.A., and Mr. F. E. P. Edwards, F.R.I.B.A., assessors.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

MARCH 2.—**Bedwas.**—PREMISES.—Erection of shop premises on the Newport-road, for the Llanbradach Co-operative Society, Ltd Plans and specifications seen, and quantities from Mr. Philip J. Jones, architect, Church-street, Pontypridd.

MARCH 2.—**Cleckheaton.**—SHOPS.—Erection of two shops, etc., Bradford-road. Plans seen, and quantities from Messrs. R. Castle & Son, architects, London City and Midland Bank-chambers, Cleckheaton.

MARCH 2.—**Moelfre.**—COTTAGES.—Erection of six cottages. Drawings and specifications with Mr. W. G. Williams, M.S.A., architect and surveyor, Bangor.

MARCH 2.—**Pitglassie.**—ADDITIONS.—For additions to dwelling-house, Mid Pitglassie, Auchterless. plans and specifications with Mr. W. L. Duncan, architect, Turriff.

MARCH 4.—**Aberkenfig.**—HOUSES.—Erection of twenty houses for the Pandy Estate Building Club No. 2. Plans and specifications with Mr. F. W. Burnett, architect, Tondu, near Bridgend.

MARCH 4.—**Bideford.**—CHURCH.—Erection of a United Methodist church, with a school hall, classrooms, etc. Plans and specification seen, and quantities, on deposit of 1*l.* 1s., from Mr. W. Beddoe Rees, architect, 3, Dumfries-place, Cardiff.

MARCH 4.—**Blackwood.**—HALL.—Erection of a new mission hall. Plans and specifications seen, and quantities, on deposit of 2*l.* 2s., from Mr. A. F. Webb, M.S.A., architect and surveyor, Blackwood.

MARCH 4.—**Bradford.**—WAREHOUSE, ETC.—Erection of shed, motor-house, and warehouse at Dumb Hill, Frizinghall. Drawings and general conditions of contract seen, and quantities and forms of tender from the City Architect, Town Hall, Bradford.

MARCH 4.—**Chepstow.**—STATION.—For erection of a police-station. Plans and specification with Mr. W. Tanner, F.S.I., County Surveyor. Quantities on deposit of 1*l.* 1s.

MARCH 4.—**Listowel.**—HOUSES.—Erection of thirty houses. Plans and specifications by Mr. J. O'Malley, B.E., Limerick.

MARCH 4. **Moretonhampstead.**—SCHOOLROOM. —For erection of a Sunday schoolroom. Plans and specifications with Mr. J. C. Beare, architect, 42, Devon-square, Newton Abbot.

MARCH 4.—**Torryburn.**—SCHOOL.—Erection of proposed new school. Plans and schedules from Mr. John Houston, architect, St. Margaret's-street, Dunfermline.

MARCH 5.—**Blackpool.**—SHOP, ETC.—Erection of a meter-testing shop and other buildings adjoining the present workshops in Hull and Sefton streets. Plans, specification, and conditions of contract seen, and quantities and form of tender from the architect, Mr. Herbert Wade, 27, Birley-street, Blackpool. Deposit of 2*l.* 2s.

FOREIGN AND COLONIAL.

Hotel, Norway.

Information has been received regarding a proposal to form a company for the construction in Norway of a large hotel. Particulars may be obtained by British contractors and manufacturers on application to the Commercial Intelligence Branch of the Board of Trade.

Building in Turkey.

There is a considerable amount of building likely to be done in Constantinople shortly (see *Board of Trade Journal* of August 3, 1911, pp. 211-12). The two large areas destroyed by the fires in Stamboul in July, 1911, must be rebuilt, and there are schemes for improving the town. Comparatively little of the building material used is brought from the United Kingdom.

TRADE CATALOGUE.

We have received from Messrs. T. & W. Farmiloe, Ltd., Rochester-row, Westminster, S.W., a catalogue of paints, colours, varnishes, distempers, etc., manufactured by them, in which they draw special attention to their "Nine Elms" pure paint, which they guarantee is manufactured from the finest materials. In referring to the excellence of this paint, Messrs. Farmiloe make the following observations, which will be endorsed by all paint users of experience:—"There are many lower priced paints on the market than 'Nine Elms,' but there is no doubt whatever that cheap paint is always expensive, as, apart from the poorness of the covering capacity, the work does not last and requires to be done over two or three times in the period that would only be taken once by the high grade article." We know that to our cost! The "Nine Elms" pure paint is supplied in white and in forty-eight art tints, while any other tint can be secured. The paint is made in four forms, *i.e.*, (1) Glossy, for finishing; for inside or outside use; (2) extra glossy, for finishing; especially suitable for outside work and for seaside places; (3) undercoating, or first coat; and (4) flat, for finishing flat or for undercoat for enamelling. The firm also supply the following "Nine Elms" brand materials, *i.e.*: —Greenhouse paint, pure pruning, white lead, super white patent driers, linseed oil putty, plastic putty, special white japan for decorators, ready-mixed paints, paints for ironwork, aluminium paint, water paint, ceilingite, liquid paint remover, wood preservative, decorators' and painters' soap, etc. As to their plastic putty, it is claimed that it is unaffected by damp, heat, or cold. "Coverite," a new rapid undercoating, enables two coats of paint to be applied in one day, and the firm's lustre paint is a paint that will keep its colour under unfavourable circumstances. There is nothing so disappointing to the skilled man as to find the paint that he has applied with care and discrimination change its colour for some apparently unknown reason. This is frequently caused by such adverse influences as sulphurous fumes and sewer gas. In many cases smoke and fog have been found sufficient to materially change the face of a paint, no matter how genuine the latter may be in its composition; but it is claimed that lustre paint will resist all atmospheric conditions and retain its colour and brilliancy of surface for any length of time. The catalogue mentions other goods supplied by the firm, including enamels, preservative paints, stains, dry colours, colours ground in oil, asbestos fireproof paints, varnishes, wood stains and oils, and many other specialities.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

PUBLISHER'S NOTICES.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to my person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than 10 a.m. on Thursday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

*Denotes *accepted.* †Denotes *provisionally accepted.*

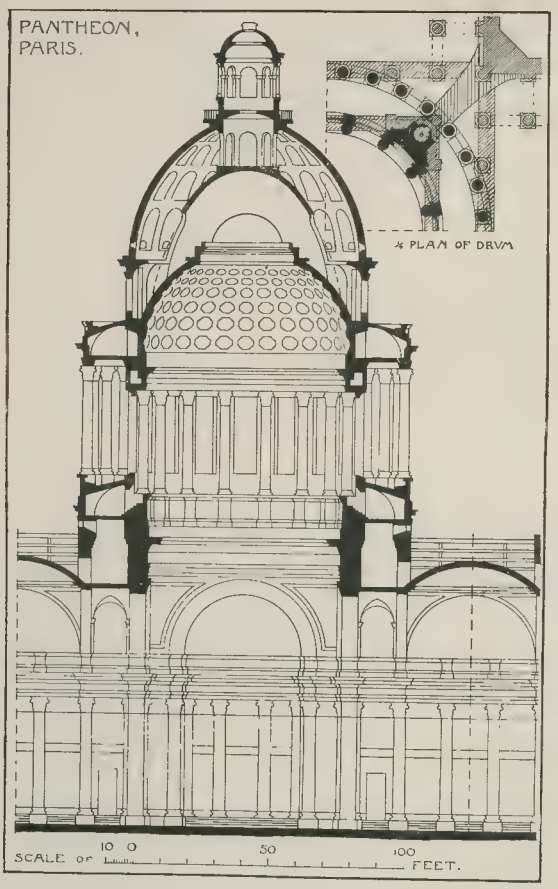
THE LONDON OPERA HOUSE, KINGSWAY. MR. BERTIE CREWE, ARCHITECT.

ILLUSTRATIONS OF LECTURE ON "MEDIÆVAL SCULPTURE," BY MR. W. H. BIDLAKE, M.A., AT CARPENTERS' HALL.

Premises at West Ealing for the London County and Westminster Bank.



Messrs. Hall-Jones and Erskine S. Cummings, A.R.I.B.A., Architects.

[This building, the design for which was exhibited in last year's Academy, is in course of erection. It is faced externally with Fareham red bricks with Portland stone dressings, the base being of Aberdeen grey granite. Internally the walls of the banking hall and the manager's room are panelled to a height of 9 ft. 6 in. The ceiling is modelled in fibrous plaster, and the floor of public space is executed in marble. The general contractor is Mr. Walter Dickens, of Ealing.]

HOSPITAL COMPETITIONS.

WHEN a responsible journal such as the *Hospital*, representing, we presume, the opinion of al administrators, makes such re- on the conduct of hospital com- ons as we quote in another column eliberate opinion can hardly be d by those responsible for the nt method of conducting them. entirely agree with the *Hospital* the question is a very grave one, no class of building perhaps is it so absolutely vital to the health of the nation that the best talent in the architectural profession should be at its service. From the professional point of view the question is hardly less grave, for it is of the first importance that the method of conducting public competitions should be such as to inspire confidence in the public that this object has been attained.

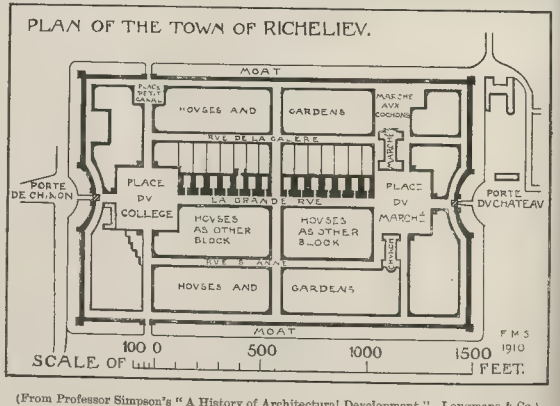
We are not for the moment concerned with the criticism of the Hastings competition, put forward by the *Hospital* as the latest illustration of its remarks, neither are we concerned to defend the present system of appointing a single assessor for public competitions. It is a system that, as far as we know, does not generally obtain in any other civilised country, is, we think, condemned in this one by a majority of the more enlightened among the architects, is admitted by the Institute to be unsatisfactory in large competitions, is not adopted by it in its

(From Professor Simpson's "A History of Architectural Development." Longmans & Co.)

own students' competitions, yet is still sanctioned by it in all others for reasons which, we suppose, are satisfactory, at any rate, to itself.

But although we may not be altogether satisfied with the present system of assessing either hospital or any other class of competition, and are inclined to the opinion that if a proper application of the jury system had always been in force any such mistakes as are here alleged would be less likely to occur, we see no reason to anticipate any startling improvement from the proposal put forward by the *Hospital* that a "competent hospital expert" should be associated with the assessor. We are aware that in France and other countries where the jury system obtains it is customary to include one or more hospital administrators or medical men, and that the system is said to work satisfactorily, but that is not the same thing as associating a hospital expert with a single hospital architect. If, however, a jury on which hospital managers were represented would inspire more public confidence in the award, that alone would be an argument in its favour.

Although something is to be said for our contemporary's proposal, there is little to be said for the reasons it gives for it. A modern hospital, like other buildings of a technical nature, may be many-sided; but to say that no architect by himself has the knowledge to enable him to judge it as regards its administration and requirements is to make a statement that, whichever way it is read, needs some thing more than mere assertion. If it is meant as a general statement that no architect can ever have this knowledge it is manifestly absurd, as without knowledge no one could design eith hospital or anything else; but means that as a matter of fact none o architects who at the present momen designing hospitals happen to possess knowledge it is a statement which hope, and we venture to believe, i way represents the facts. In e event we presume that the "Fello the Royal Institute of British Archi of great experience and position" whose knowledge the *Hospital* itself sufficient confidence to ask him examine and report on the Hast designs is the exception that proves rule.



In spite of the element of truth in suggestion that hospital architects not always be in touch with the l results of medical research most a tects, we think, would be inclined say that hospital competitions ne strengthening up rather on the archi tural than the technical side, and there is already a tendency to a them on technical details upon w even hospital experts may differ. If tendency is to be accentuated by a ciating hospital experts in the award certainly would be necessary to c teract it by the inclusion of one or t architects of general knowledge and w outlook capable of viewing the sub from a detached architectural sta point.

As for the panel of experienced ar tects, competent on their merits to as assessors, it is generally underst that the Institute possesses such a and, presumably, makes use of it.

THE TEXT-BOOK.*

CONTINUING his historical sea Professor Simpson in this volu explains that to extend its sc beyond the three count named would either have und curtailed the proper treatment the subject or would have swel the book to unreasonable proportio On perusal it becomes clear t the author is amply justified in t contention; only by the exercise of utmost restraint and by every effort

* "A History of Architectural Developme Vol. III. "The Renaissance in Italy, France, England." By Professor F. M. Simpson, F.R.I.B (London Longmans. Green, & Co. 1911. 8vo. 21s. n

(From Professor Simpson's "A History of Architectural Development." Longmans & Co.)

direction of compression is it possible
ring a general view of Renaissance
tecture within the limits of a text-

deed we are not at all sure that it is
to make the attempt. For the pur-
s of the student such a rapid survey
less educational value than a more
ugh investigation of some special
lopment limited in time and place.
reply may be made that a general
of the relative importance of all
architectural developments must
rasped as a foundation for more
ate study, but we are inclined to
t the soundness of this view. Granted
ecessity for the historical text-book,
ne before us is excellent in its way;
vers the widest possible range of
cts within its specified limits, and
e same time finds space for quite a
er of critical disquisitions on the
and wherefores of the architectural
cteristics of the different schools
periods.
ne the less, it is impossible to avoid
rtain feeling of irritation with the
ant change of scene. Just as the
r is beginning to get interested, he
rforce, "moved on" by reason of
ecessity of covering so extensive an
between the two covers of a con-
ntly proportioned volume.
will be understood that this criti-
is not aimed at Professor Simpson's
which achieves its purpose admir-
but we are entitled to question
ner the almost universally approved
od of the comprehensive text-book
sound one from the educational
point. We do question this,
y in view of the consideration that
ccumulation of unrelated facts is
ttle educational value. In his
ers on the development of Renais-
churches and on the construction of
the author gives comparative
s of real value to the student,
e should have welcomed a treatment
on these lines for the other sections
e book. Here and there we see,
l, a reflection of this method, but the
alisations and extended outlook
lered essential in a text-book cut
these essays and prevent their
ng a complete and conclusive form.
later Renaissance in France seems
ffer most from the compression
able in a work on this basis, but,
ourse, the two important books
ly published on the French
ssance provoke unconscious com-
ns which cannot be fairly made.
h Professor Simpson has treated
e somewhat briefly, we are glad to
ise that this is in no way due to a
f appreciation of the merits of its
ecture, as will be seen from the
aph closing this portion of his

—

e François premier buildings are well
to most English students, but the later
es in France have hardly received the

little from our requirements now.
ey present such variety. They form a
in themselves. To advise careful study
is not to recommend neglect of either
buildings or our own. Opportunities
lying all are now easy, and time ought
found for all. Attention should also
n to modern work in France. Notwith-

standing the political upheavals the country has experienced, her architectural traditions have remained unbroken for centuries. They have been assailed and opposed by Viollet-le-Duc and a few others, but have emerged triumphant. The École des Beaux-Arts has preserved them, nurtured them, and passed them on from one generation of students to another. To this cause is largely due the excellence of the work of the present day. It may occasionally be dull, but it is never bad; and its best excels the best of any country in Europe."

Coming to England, we again feel the pressure due to the demand for condensation. Might not the crude beginnings of the Renaissance in Elizabethan and Jacobean periods have been dealt with in a brief introduction, leaving the space so economised for a fuller treatment of the more refined work of the XVIIIth century? After Blenheim we get but little, although a short supplementary chapter is devoted to the varied and conflicting ideals of the XIXth century.

The work of the brothers Adam is not illustrated, which is to be regretted, as this work may be regarded as the most distinctively national of all the developments of the Renaissance style in England. True, the no less characteristic Louis Quinze is equally ignored; so, were it not for this last chapter, we should have assumed that it was the intention to bring the work to a close early in the XVIIIth century, the date at which the jurisdiction of our Royal Commission on ancient buildings ceases. We would not accuse Professor Simpson of regarding all more recent work as unworthy of notice, his view being, more probably, that it does not come within the period covered by the term "Renaissance." Be that as it may, is it not of greater value to the student as an illustration of carefully studied design and accomplished technique than the tentative efforts of the period of transition from Gothic to classic detail?

Possibly we may have a further volume dealing with the XVIIIth and XIXth centuries, as these are assuredly worthy to be included in the curriculum of any school of architecture.

From a Drawing by Mr. Leslie Wilkinson.

(From Professor Simpson's "A History of Architectural Development." Longmans & Co.)

C

NOTES.

The Associates and the R.I.B.A.

THE proposal to give equal representation to the Associates of the Institute of Architects not being strongly supported at the meeting on Monday, and failing to convince the meeting, the justice of the case seems to be met by an undertaking that the Council would consider the matter and report to the general body, which will then have a further opportunity to discuss it. As we have already pointed out, the present position of affairs is a source of weakness. If matters are allowed to drift in what appears to be their present direction, the future may show us a house divided against itself, and so reduced to impotence. This is a danger which can hardly escape the notice of the Council. When considering the question of representation, the present constitution of the Associate class, the general trend of their apparent policy, and its effect on the future of the Institute will no doubt be borne in mind. Considering the importance of the issues involved and the necessity that when taking its next step forward towards Registration and the unity of the profession the Institute should be in a position to do so as a united body without fear of opposition on a side issue from a class of its members who as individuals may agree with its proposals on their merits, it might perhaps be thought desirable to appoint a strong and representative Committee to inquire into the whole question and endeavour to come to some solution which would be equally acceptable to all classes. The position created by the examination has to be faced, and the sooner it is faced the better.

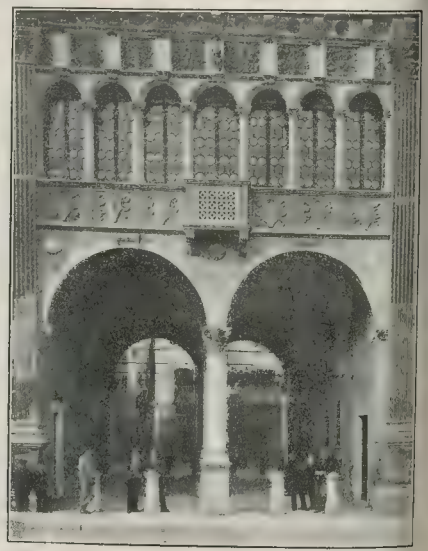
The Attitude of the Associates.

WE publish in another column an interesting letter from Mr. W. S. Purchon, which adds further proof to our suggestion, that the examination is at the root of the difficulty. That the Associateship indicates something perfectly clear and definite, while the Fellowship does not, is no doubt true at the present moment; but if the Associates passed in as a matter of routine, the Fellowship would soon mean something just as definite: the qualification of an Associate plus seven years of actual practice. While, however, the Associates retain their present attitude it is difficult to see how this desirable result can be obtained except by alteration of the constitution of the Institute. To this end the suggestions put forward by Mr. Purchon seem to point, and we think they are well worthy of consideration.

Publication of Speeches in the R.I.B.A. *Journal*.

ALTHOUGH there is something to be said for the proposal that a complete Report of all speeches delivered at business meetings of the Institute should be published in the *Journal*, it is probable that the course ultimately adopted of leaving a wide discretion to the Chairman will meet with general approval. No doubt it is, as a rule, desirable that the views of any member should be accessible to all the members. Particularly is this the case when these views happen to be opposed to those held by the majority or by the governing body for the time being. In the unlikely—we might almost say inconceivable event of their improper suppression, a direct injustice might be done to the individual, and an indirect injury might, in consequence, be inflicted on the Institute; but if every indiscretion or lapse from good taste, short of libel, that was uttered at a meeting was reported intact in the *Journal* far greater harm might result. Evidently it is a case in which someone's discretion must be trusted, and, judging by some recent remarks which might well be considered objectionable by the members society in negotiation with the Inst the meeting was well advised in pref to trust to the discretion of the Cha rather than to that of each or ever of the members.

The Lady Architect Again.



THE lady architect, h a perfectly rational normal character, doe gain by the way in her case is presented to the public the *Daily Chronicle* the topic was with a few days ago in some d paragraphs which are sometimes amu but which one hesitates to believe appeal to the emancipated of the se here one finds, besides facts usually and obvious, other things which di a lamentable want of knowledge o actual facts of life.

"Her sense of the beautiful will sav from 'cheap nastiness,' and from incongr of colour and design. Her own home-tra will teach her how to combine comfort, cl ness, and convenience. She will know to put the coalhouse, the larder, and th stove so as to save the housewife all po inconvenience. She will make the kitche veniently near the dining-room, and ye near enough for the family to be dist in the event of Mary Jane having 'e She will have plenty of dry cupboards, boards with shelves and cupboards wit She will not have windows that stifle or require wedging, or that are difficult or gerous to clean, or rooms so shaped that are impossible to furnish tastefully. Sh see to it that 'domestic upheavals' pr the minimum amount of bad temper an comfort, that water-pipes do not burst, and the whole house is well warmed even i coldest weather. Her natural tact and perceptions will help her to understand clients' wishes and to carry them out faith Her sense of humour will go far to sav from the loneliness of having so little profes companionship in her own sex."

In this comprehensive bid for patro the lady architect does not omit th evitable claim to intuitive genius, adds also a monopoly of the humo sense—surely a sign of the advan

. But she does fail to acknowledge weak points in all such eloquent ges that the mere male architect t (if he wishes) altogether avoid— intimate knowledge of domestic nience which the training of the architect in office and technical l so admirably inculcates. In spite general decadence of the male sex, verage architect is fortunate enough married, and if lack of means or tunity prevents such a consumma- there is always an alternative no man of experience can lightly ard, and that is no less a personage the lady client! If architects still the feminine tendency to make the a mere agglomeration of cupboards utensils, they have nevertheless ssed other professions in gladly ing open their institutions and ies to the lady architect herself. etition grows keener and keener year, but the pioneer will not y affect the stability of the pro- unless she is prepared to take seriously and face male competition own merits.

The apshire ciation chitects.

Our readers will be interested to know that at a meeting of representative architects of Hampshire, held at Southampn the 2nd inst., it was decided to h Hampshire Association of Archi- on the lines of those affiliated R.I.B.A. Mr. R. F. Chisholm, B.A., presided. Draft rules were ered and passed, also declarations signed by members, Associates, and ted craftsmen. Sir William Portal, .S.A., was elected President, and . C. H. Nisbett, A.R.I.B.A., Vice- ent and Chairman of Committee; t. M. Lucas was elected Hon. ary and Treasurer, with Mr. Ingal- nders assisting. We welcome the ociety, and hope it will have a long eful career.

HE "REINDEER" INN, BANBURY.

UEY, on the Cherwell, in the county ord, is placed in the centre of one of st fertile districts of the country. erly it had several flourishing indus- ut these gradually declined and dis- d to vanishing point, and it is feared e beautiful and picturesque buildings are the same fate.

e is much to interest the archæologist tist in this once important market notwithstanding the destruction of so nteresting records of the past. The ul church, one of the largest in the was ruthlessly destroyed to make r a classic temple built in 1793. A of the period runs :—

"Dirty Banbury's proud people
Built a church without a steeple."

ttle stood two sieges during the Civil one of many weeks' duration, in nder the brave ancestor of Lord Saye le of Broughton Castle, when the h was relieved after all their horses en eaten.

e Cross" was destroyed long ago by ritans, but a later generation replaced structure designed in the early days Gothic revival.

e interesting old houses and inns the nspicuous is the picturesque hostelry, eindeer," which was always worth a Banbury. This interesting building, gable and fine stone mullioned win- as built in 1624.

n there is a beautiful room (called be Room) with fine oak panelling. It has a very elaborate, and probably unique, plaster ceiling of intricate design; at a great expense a copy of this was made for the Victoria and Albert Museum.

It is unfortunate that the Town Council had not powers to purchase the "Reindeer" and preserve it to the town, or that it could not be bought and taken over by the Society for the Preservation of Ancient Buildings, and be thus kept in this country instead of being transported to America as appears to be contemplated.

THE CARPENTERS' HALL LECTURES:

MEDIÆVAL SCULPTURE.

The fifth of the present series of Carpenters' Hall lectures on Arts Connected with Building was delivered on the 21st ult. by Mr. W. H. Bidlake, M.A., whose subject was "Mediæval Sculpture"—to the end of the XIIIth century.

Mr. Bidlake, who showed a fine collection of lantern slides, said he proposed to speak of sculpture as a decorative art, and to consider it in relation to the building of which it was the noblest ornament. Twice in the world's history had decorative sculpture been truly great. The Greeks of the Vth century B.C. and, nearly 2,000 years later, the French of the XIIIth century A.D. realised the harmony of sculpture and architecture.

Having compared briefly the two ages and surveyed the circumstances which gave rise to Gothic art, the lecturer mentioned some of the disasters which overtook the Western Roman Empire from the IVth century. Proceeding, he said it was difficult for us nowadays to realise the paralysing dread with which the advent of the year 1000 was regarded or to measure the full extent of the relief when it was passed. As a direct result, a great wave of exaltation and religious enthusiasm swept over Western Europe, the Church rapidly rose to the height of her power, the monastic Orders to the limit of their influence. It was in these days that mediæval sculpture was born. We could not have art without feeling. Art is the expression of the stirring of the spirit's inner depths. The routine designing and mechanical execution of our modern commercial workshops was not art at all, and never could be until its whole spirit and method changed.

In Byzantium the arts after the temporary eclipse of the iconoclastic controversy of the VIIIth century, which was a reaction against the worship of images in churches, and which indirectly led to the immigration of Byzantine artists into the West, recovered themselves and reached their fullest development during the great Macedonian and Comneni dynasties of the Xth and XIth centuries. It was just at this time that the soil of the West lay fallow for the seed, and the art which in due time sprang up had been called Romanesque art. Romanesque art, and especially Romanesque sculpture, was of very mixed origin, and from the character of the surroundings or external influence one trait predominated in one locality, another in another. In the South of France, and especially in the district between Limoges and Toulouse, the Byzantine element asserted itself. Byzantine influence was even more manifest in the art of Western Germany. Occasionally the Norse element asserted itself, especially in Herefordshire, as at Shobdon and Kilpeck, in the myth of Fafni the dragon.

The "Reindeer" Inn, Banbury.
From a Drawing by Mr. S. Aveling.

Barbaric, too, was the overladen and unrestrained ornament which characterised our late Norman style, as in the west front of Iffley, which was akin to the decoration of a Maori canoe-paddle. It was the element of the grotesque, often interwoven with the foliage of the capitals that was so characteristic of Romanesque stone carving. The style was exhibiting a most extraordinary energy and displaying an unbounded spirit of experiment and invention. It was a living style. It was yearly freeing itself from the conventions and mannerisms of its Byzantine swathing and acquiring a language of its own. If our art to-day was not venturing, experimenting, and advancing, if it was content with reproducing forms from which the spirit had fled, then it was a dead art, but a dead art practised in the living present was a contradiction in terms.

A survey of the origins of Romanesque art would be incomplete without reference to the Saracenic influence in the South of France, which spread from Spain and the Mediterranean. The civilisation of the Arab conquerors of Spain was in advance of that of Europe, and amongst them both the sciences and arts were more developed. Indeed it was from the Arabs that Europe received that spirit of scientific inquiry that began to work like a ferment in men's minds, notwithstanding all the efforts of the Church to suppress it.

In the larger figure sculpture of the XIIth century Byzantine mannerism was very apparent. The figures were rigid and immobile, and the drapery was either stiff and jewelled, or indicated by parallel grooves cut over the modelling of the figure without the slightest pretence of the study of drapery or appreciation of its capabilities of expression. In other cases it was studied not so much in relation to the figure as to produce a decorative effect, and the hem was often doubled and pleated in a manner strangely reminiscent of archaic and still more of archaistic Greek. Besides the school of Arles in the South, there existed a quite distinct school in the south-west of France, of great originality, and characterised by the dramatic expression of its figure sculpture, the almost volcanic energy of its tearing beasts and a strongly decorative feeling, as one may see in the great doorway at Moissac. How great a contrast to this expression of southern energy was presented in the North by the placid figures of the royal doors in the west front of the Cathedral of Chartres. The statuesque nobility of these figures as well as the gravity and sweetness of the expression which play over their faces compelled our admiration. Who that had seen them did not love them?

There was no division of labour in those days, such as there is now. The sculptor did not belong to a caste apart with a private studio and an aristocratic connexion. He was fellow-workman with the mason. He was called the "imager," and could probably take a hand in any kind of stonework that came his way; perhaps, too, in much other kind of work the bane of the modern division of labour is that one man designs and another executes, so that the one lacks the pleasure of executing his idea and the other the pleasure of inventing his work. Still, the question obtruded itself, Was the sculptor the imager going too far in making his figures, as at Chartres, so very attenuated? Recognising that they were placed on the door shafts and that it was desirable that he should bring his figure design into harmony with its architectural setting had he not sacrificed too much? Granted, too, that the total effect was splendidly decorative, could not the same effect have been produced without such sacrifice of the proportion of the human figure? There was here a singular parallel in classic Greek art. On the south side of the temple of Athena, known as the Erectheion, at Athens, there was the famous caryatid portico, in which entablature was borne by draped female fig in place of columns. As the figures act carried the weight, it was even more esse that they should be in harmony with the a tecture than was the case with the Cha figures. It was inconceivable that a G sculptor should sacrifice the beauties of hu proportion under any exigency. Nor did in this instance. He made his figures epitome of strong, vigorous womanhood, features calm and dignified, the weight thr on one limb, he expressed in the vertical of the drapery, which challenged compar with the flutings of the columns of the neighb ing portico, and the neck which might other suggest by its temerity the overpowering we of its burden, he strengthened and suppo by massive coils of hair. Triumphantly had solved the difficulty; no whit of hu beauty had he sacrificed, yet his stately figu in perfect line with the temple architec made light of the burden that was imp upon them.

The problem of the Chartres figures was to be solved in due course, in the west por of Rheims. For the present, in the Romanes schools the decorative treatment of the sculp and its subordination to the architecture the paramount consideration, and we h bear this aim in view in measuring the suc of their achievement. The full realisation sculpture, as sculpture on the one hand, its due subordination to the architecture the building which it decorated on the ot can with difficulty be reconciled.

As the XIIth century advanced the Rom esque sculptors in general seemed to have s their wild oats of decorative unrestraint, as it drew to a close and the architectural s changed to Gothic, in response to a more sk construction and disposition of material, t restraint became manifest without which no could be truly great. The change could be studied in England. In England during Romanesque period little sculpture of any w was done, the west door of Rochester Cathe being the best example, as it was the e example of sculptured figures arranged in jambs after the manner which had also become so common in France. Meanw magnificent progress had been made in the of building, and nowhere in France had ca drals been erected on a grander scale than th which formed the churches of the great Be dictine monasteries of Durham, Ely, Pe borough, and Norwich. The Benedic monasteries of Western Europe had rende splendid service to the arts, which, but for t patronage and asylum might have perishe the anarchy of the Dark Ages. It was to Cistercian Order of reformed Benedict that we in England owe the introduction of th new ideas in Romanesque building wh resulted in the development of Gothic. new departure which might be studied in ruins of many of the Yorkshire Abbeys, c sisted in something more than the introduc of the pointed arch. A new spirit breathe their architecture, a wholesome spirit of restra

The severe rules of the Order forbade decoration of sculptured figures, and a similar, though more extended, prohibition the Koran obliged the Arabs to evolve t characteristic ornament, so the restrictio their case diverted their attention from fi sculpture to the adornment, the articulat of their building of capitals, bosses, and st thus giving piquancy and accent t construction. Laying aside the Romanes acanthus and the Norman cushion capital, t evolved a treatment of foliage capital not the direct study of plant form, but by expres the principle of plant growth, and that i manner perfectly suited to the material in w it was carved. Indeed it would be difficul find a better example of design growing ou the distinctive treatment of the material.

As to the figure sculpture of the Eng and especially of the French schools of XIIIth century, the disposition of the sculp on the cathedral façades was quite differen the two countries. In France it peopled great triple portals and stretched overhea an unbroken line of kings or ancestors of Ch In England, on the other hand, the west d were comparatively insignificant, and the sc ture, where there was such, was arrange niches, row upon row, across the west front at Lincoln, where it had disappeared, or I field, where it had been restored. At W it was fitted into the architectural framew

INDUSTRIAL UNREST.

HAVING regard to the period of industrial unrest through which we are passing, and the dislocation of trade consequent thereon, which affects all classes of the community, it may not be unprofitable to glance for one moment at the statistics for the past year.

Last year was one of increasing prosperity, and in the past experience has been that years of increasing prosperity are marked by industrial peace. Yet what was the history of last year? An article, entitled "Employment, Wages, Prices, and Disputes in 1911," in the *Board of Trade Labour Gazette* for January commences with these ominous words:—"The good employment which was very general in 1911 was discounted to some extent by industrial unrest."

In the first place, let us see what were the results of this industrial unrest; 931,050 workpeople were involved in disputes which commenced in the year—the largest number recorded in the statistics of the Department. Fortunately, the disputes were not of long duration, but, nevertheless, they represented a loss in working days of 10,247,100; excluding agricultural labourers, this means a loss of about one working day per head of the industrial population, and 9 per cent. of that population were involved in disputes. What is the money loss of this kind of industrial warfare? If each person earned but 2s. 6d. a day, we have here a useless loss of 1,280,887*l.*

The year was one in which the rise in rates of wages which commenced in 1910 was continued, the net result being an increase of 25,927*l.* per week, and it surely is a significant fact that this increase in the rate of wages totals 1,248,204*l.* for the year, or 32,683*l.* less than the sum lost by disputes, computing that loss on the low rate of wage of 2s. 6d. The figures given above relate to rates of wages only, not to the sums paid in wages, and it may be assumed that some at least of the disputes were entered into to gain an increased rate of pay. If that be so, what has been the result of the industrial unrest in this connexion? The result, as shown above, is that the increased rates of wages obtained have been more than lost to the industrial population by profitless disputes. If it be urged that lack of employment is the excuse for industrial unrest, and that the figures relating to rates of wages have no bearing upon those earning no wages, the statistics again afford a complete answer to such a contention, as the figures relating to the 800,000 members of trade unions show that the mean percentage of unemployment fell to 3 per cent., as compared with 4·7 per cent. in 1910, 7·7 per cent. in 1909, and 7·8 per cent. in 1908.

At a time of industrial crisis these figures are surely worthy of the consideration of all classes. The loss to the labouring population by these continued strikes can be demonstrated, as above, by figures, but the loss to the employers and the loss to the nation cannot be ascertained, nor are the effects of each strike limited to the period during which it continues. Work and capital leave the country, possibly for good and all, and in too many cases whilst we are engaged in fighting over shadowy principles the substance of our trade is going abroad. As we pointed out recently, one of the reasons put forward for industrial unrest is the rise in the cost of living, and we dealt with some of the causes of this rise. We need not recapitulate here, but we may refer to some of the statistics relating to retail prices, as they fail to show any serious crisis calling for immediate drastic measures. The retail prices for food in 1911 showed a decline on the whole of 0·5 per cent. as compared with 1910, and for the first nine months of the year they were lower than in 1909 and 1908. The long drought caused a rise in certain commodities, but this rise was not continued, and such articles as bread, bacon, and oatmeal showed a heavy decline. The statistics for London show no serious rise in the twenty-three principal articles of food in the last four years.

The causes of labour unrest cannot be wholly traced to this cause, although the rise in the necessaries of life taken over a long period has something to do with it. The causes are complex: increased ideas as to the standard of luxury necessary to existence prevalent amongst all classes; higher education amongst the working classes, which engenders a natural feeling of restlessness; increased taxation and rating; and, lastly, mistaken ideas as to the nature of wealth. These latter cannot be better exemplified than by quoting a sentence contained in a letter recently written to the *Times* by a leading Socialist:—"I think it should be generally recognised that the wage-earners in many departments are not only discontented with their standard of life . . . but many of them are beginning to ask why they should be condemned to toil all their days for a very poor remuneration and very small enjoyment of existence, when, with the present power of man over Nature, wealth might be made as plentiful as water, and all who do useful work during a few hours in the day might have a really pleasurable time."

Many of the above causes deserve careful consideration, others condemnation, but the statistics which we have quoted, at any rate, show that internecine industrial warfare carried on by means of lock-outs and strikes is fatal to the interests of the nation, and we may point out that the remedy lies not in measures of the type of the Trade Disputes Act or the Eight Hours in Mines Act, or in fixed minimum wage, but rather in the direction of co-partnership, co-operation, and conciliation.

SOUTHWARK CATHEDRAL.

THE opening on February 13 by the Lord Mayor of the new bridge and gates which will now form the main approach to the cathedral marked also the completion of the restoration of certain parts of the building itself.

Externally, the bridge and the wall and railing surrounding the cathedral is what is most apparent of the work just finished. The new railings and gates are of wrought-iron and simple in design, and replace those put up about eighty years ago, which were of rather an elaborate Gothic design, but, being light and of cast-iron, had become irreparably broken.

The bridge is of Portland stone, the paving and steps being of granite. The style adopted is Gothic of the Decorated period. The four large shields on the parapet of the bridge carry the arms of the Province of Canterbury, the Cathedral and Diocese of Southwark, and of the Parish Church of Southwark (St. Saviour and St. Thomas). Four small shields on the gate piers bear the arms of the four bishops under whom works of restoration and rebuilding of the church have in recent times been accomplished.

The work on the cathedral itself was chiefly confined to the tower, and a very great deal of strengthening and replacing of decayed stonework has been found necessary.

The greater part of the external facing and other features dated from about 1820-30, when Mr. Gwilt, the architect, carried out extensive rebuilding work at the church. The facing in many places consisted of inferior stones, very thin on bed, all of which had to be cut out and replaced.

On the north-east angle the turret staircase originally existed to the top of the tower; this was done away with presumably when the present pinnacles were erected. The inner face of the old turret stairs was disclosed during the present work, and, the more modern angle stones not having been properly bonded in, this corner was found to be particularly weak, and a considerable amount of rebuilding necessary. The new stone used on the tower is Chilmark.

In connexion with Mr. Gwilt's work it is perhaps worth mentioning the extent to which he made use of cast-iron. The tower is at two levels, elaborately (and effectively) bound round with cast-iron bands made in lengths which join with a kind of dovetail joint. They are of heavy section, the larger one being about 6 in by 3 in. solid. They were bedded under the surface and found to be in excellent condition.

The trusses of the choir roof are all of cast-iron, and, besides window frames, the louvres of the belfry windows and even flashings to the copper roofs are in the same material. The trusses and ties are all stamped with the date and the architect's name.

Internally, immediately above the present ceiling an arcaded stage of late Decorated date, which was found walled up, with the

Southwark Cathedral New Approach from London Bridge from South-West.

mouldings much mutilated, has been opened out and repaired.

The ringing chamber above has been refitted. The bells and frame have been very thoroughly overhauled, rehung, and repaired by Messrs. Mears & Stainbank, who also recast the tenor bell, weighing about 53 cwt.

The timbers carrying the bell frame and the tower roof had to some extent perished, and a considerable amount of work was done in repairs and renewal.

The ceiling under the bells (now the ceiling of the ringing chamber) was found to be partially original, of late Decorated date, consisting of oak ribs dividing the ceiling into panels, with finely-carved bosses at the intersections, all bearing traces of decoration. This ceiling was doubtless that originally seen from the floor of the church, whence there would therefore have been visible, above the level of the present tower ceiling, a blank arcaded stage and a lantern stage consisting of the present lower range of windows, an additional 35 ft. in height, or about 105 ft. from the nave floor. Other work lately accomplished consists in repairs to the buttresses and pinnacles of the choir, relaying of gutters to the choir, aisles, and Lady Chapel, and new glazing in the choir clearstory windows.

Excavations for the new bridge and boundary walls to the south-east of the cathedral brought to light several fragments of pottery and some tesselated pavement of Roman times. The latter was at a depth of about 10 ft. below the surface.

The general contractors for the work were Messrs. Dove Bros., of Islington, and Mr. R. Searle has been acting as clerk of works. The architects are Messrs. J. Oldrid Scott & Son, of Dean's-yard, Westminster, S.W.

"ONE AND ALL GARDENING."

The seventeenth issue of this interesting annual (edited by Mr. E. Owen Greening) contains articles on shore gardens, grass walks, etc., and the Editor in an opening article develops a plan for converting the horticultural societies throughout the kingdom into "missionaries" of gardening, to teach and help artisans, cottagers, and others; to promote allotments, home gardens, and the cultivation of vacant lands, and otherwise to aid in converting Britain into a "garden land." The annual can be had from the Agricultural and Horticultural Association.

THE RESTORER AND HIS ATTITUDE TOWARD OLD WORK.

At the third meeting of the session of the Edinburgh Architectural Association, held on January 28, Mr. William Davidson, Vice-President, delivered a lecture on "The Restorer and His Attitude toward Old Work." The chair was occupied by Mr. J. B. Dunn, F.R.I.B.A., President.

Mr. Davidson, who dealt mainly with ecclesiastical restorations, opened his lecture by dividing restorers, generally, into four classes, viz.: Historical, Antiquarian, Æsthetic, and Ritualistic. The attitude of each was described. The lecturer stated that for the ideal restoration all four standpoints must be considered, and, while a profound reverence and veneration must be felt for all existing beautiful old work, it must be remembered that a church must be suitable for its purpose as a place of worship, and not considered merely as a sanctified museum, utility, comfort, and beautiful composition being absolutely imperative. The architect should not make the restoration an opportunity for the display and glorification of his own personality at the expense of the history of the building, but at the same time a sentimental zeal for the work of the dead should not prevent him from creating a beautiful and perfect unity where such was possible.

Mr. Davidson referred to the recent intervention of "Antiquarian" and "Protection Societies," and maintained that the craze for preserving past history if carried to its logical conclusion would lead to a dead stop in the architectural history of old buildings which, if occupied for their original purpose, still had a living history. He admitted, however, that in the case of unused ruins, such as Holyrood, Linlithgow, Melrose, Fountains, Kirkstall, etc., it was better, generally speaking, if they were only carefully preserved and not restored. He stated that we also have a history to record which is, as a rule, more beautiful than much of the XVIIth, XVIIIth, and XIXth centuries' history.

Many views were shown of restorations by Sir Gilbert Scott, and Messrs. Bodley, Oldrid Scott, Temple Moore, Micklethwaite, Weir, Carôe, and others, which were analysed and criticised. These consisted mainly of abbeys and parish churches, and illustrated various methods of restoring stonework, woodwork, glass, etc. Additions to buildings, such as chapels, vestries, towe and the introduction of organs and furniture were dealt with in detail, and merits and faults of various systems discuss The principles and practice of the Society the Protection of Ancient Buildings were fu treated upon, and, while the lecturer spoke the highest terms of their work, which h saved to us many priceless gems of mediæval a he considered that they ignored the æsthe side of the question too much. Their "r repeat-of-old-detail" policy had destroyed scale, proportion, and beauty of many fine churches. The introduction of plain bloc instead of repeating old moulded work in wo and stone brought in a new scale, which many cases destroyed the unity.

Many examples of the work of the Protecti Society's able architect, Mr. William Ws were shown, and Mr. Davidson spoke the highest terms of much of Mr. Wei work, which always showed such a profou knowledge of the subject and such reveren for the beauty of old work. If the Societ principles, however, were carried to t logical conclusion, it appeared to the lectu that, as original old work must eventual sooner or later, disappear, no copy of it wou then exist. Mr. Davidson maintained that t work of the best craftsmen of to-day in sto wood, plaster, glass, etc. (with the exception the decorative artist), quite equalled that of t XVth century, and he believed that with o present general tendency to return to fi constructive principles the day was rapid dawning when, by the help of decorative a applied art, architecture would again becom the glory and pride of our country, as it had be in mediæval times. In speaking of additio to old buildings, the lecturer agreed that th should not be merely copies of existing pa of the building. They should speak th history unmistakably, but the great feature be noted was that if the scale of the origin work was good, it should be carried out in t new work. Examples from the Cathedrals Florence and Chartres were shown to illustra this point. The restoring of hammer-bea roofs and rood-screens was shown by fi examples from Norfolk and Suffolk. In spea ing of restoring glass, some excellent exampl were shown from Chartres, Winchester, Yor Norwich, etc. He agreed that no new gla should be introduced among old. Bett a small panel of old kaleidoscopic fragmer

the centre of plain old Dutch square or mond panes, as was so beautifully done Mr. King, of Norwich, under the super- on of Mr. Weir, at the east window of St. er's, Hungate, Norwich, than any attempt omplete the design. In speaking of painting, re-painting especially was such a personal k that any attempt to restore it rendered bsolutely worthless, even when done by the st sympathetic and able of artists. In ely geometric or floral work it might be done ly successfully, as was seen at the chancel of Southwold, which, though repainted e (he believed), still retained much of the liæval feeling. Figure wall painting, such South Burlingham, Potter Heigham, etc., the work on the rood-screens, should never any account be touched up or restored, but fully treated for preservation by an expert ey showed signs of decay. The rebuilding he Campanile at Venice was referred to as ece of misplaced sentimentality.

n concluding his lecture, Mr. Davidson ed that no hard-and-fast rule could be wn up for the guidance of the restorer, but must possess a profound knowledge of old k, the uses of various types of plan, a ough grasp of the evolution of design, a deep rence for all beautiful old things, and be d with unbounded enthusiasm for each k entrusted to his care—an enthusiasm ch leads to a non-personal view of each vidual problem, and which will be more ous to preserve any real beauty of bygone rs than make its destruction an excuse for display of his own personality and ability, which will not at the same time sacrifice a ious opportunity for a mere sentimental for the work of the dead.

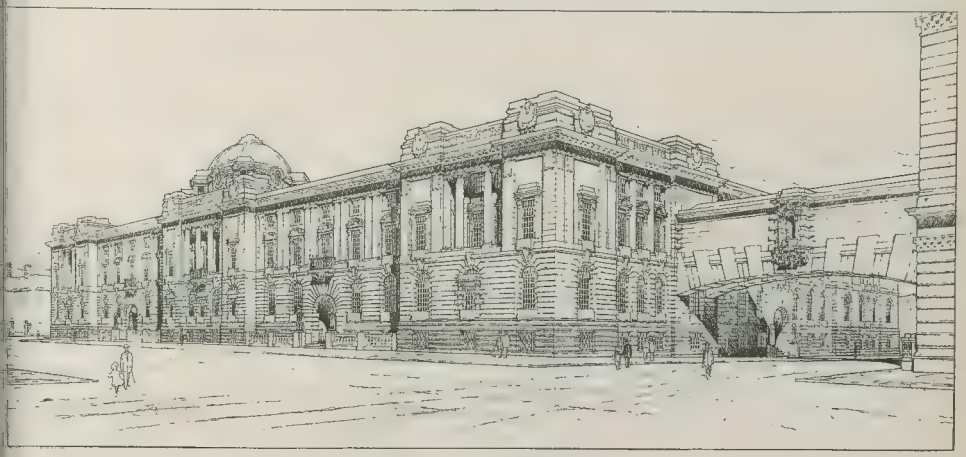
t the close of the lecture a keen discussion c place, in which Mr. John Watson, .I.B.A., Mr. J. B. Dunn, F.R.I.B.A., Mr. es Gillespie, Mr. W. Stewart Morton, and rs took an active part.

hearty vote of thanks was accorded to Davidson for his able, analytical, and lucid tment of the subject.

he lecture was illustrated by 100 lantern s of English, French, and Italian cathedrals, lish abbeys, and parish churches.

BIRMINGHAM COUNCIL HOUSE EXTENSION.

N the 22nd ult. the architects of the Bir- gham Council House extension, Messrs. V. Ashley & Winton Newman, of London, plied to members of the Birmingham hitectural Association, at a meeting in the hange Buildings, some particulars of their k at the Council House. Mr. C. E. Bateman sident of the Association) occupied the r.



r. Ashley, during the course of his paper, said as interesting to note that the plans in the nd competition had been very little altered. site was practically four-square. On the east, or Margaret-street, front was the Education Department, consisting of four floors of innumerable offices; on the south, or Edmund-street, front and in the interior of the site was the Gas Department; and on the west, or Congreve-street, front, including three floors, were the offices of the Health and Tramways Departments, both of which had already outgrown their new quarters since the extension of the city. On the first floor over the Gas Department were the new picture galleries, and on the second floor of Congreve-street the Natural History Museums, both approached from the present Round Room over the new bridge across Edmund-street. The completion of the extension on the north side was now in hand, and would give further accommodation for the Tramways, Health, and Gas Departments, including, in addition, further picture galleries and museums for casts on the upper floors, with a special entrance devoted, as it were, to the Feeney galleries. Each of these departments was self-contained, each had its own main entrance and staircase, and at the same time there was easy access between the departments.

There was very little genuine reinforced concrete construction, but he was tempted to believe that buildings of this nature were not entirely suitable to this method of building owing to the alterations required from time to time. Reinforced concrete in floors and roofs was of necessity monolithic, and while it was no difficult thing to cut out a beam with an R.S.J. in it, it seemed to him another matter to cut about reinforced work with the same ease. Externally on the street frontages the buildings were faced to the upper ground-floor level with Aberdeen granite, heavily rusticated with Darley Dale stone for the remainder of the facades. This was instead of Portland stone, which they tried very hard to be permitted to use. The Margaret-street porch was the only place where there was any Portland stone. In the semi-domed porches to Congreve-street and Edmund-street, Hopton Wood stone, with Greek Cippollino marble columns and bronze caps and bases, had been used. The courtyards internally were faced with white glazed bricks, with salt glazed dadoes and bands, etc., accentuating the features. This glazed brickwork—after more than usual trouble and difficulties—had turned out exceptionally well. It would be difficult, he thought, to come across so uniform and good a quality of brick as they would see there. The granite and stone work also exhibited good craftsmanship and material, the general contractors tackling this part of the work very well, also the plumbing both externally and inside the building.

Internally the finishings were of a very simple character—a little interest had been given to the entrance staircases and to the committee-rooms, and one or two of the larger offices, but in the main they had to remember that the building was an office building. In addition to oak and maple batten and block floors, they had made extensive use of linoleum as a floor covering—particularly in the footways to the art galleries and in the panels in the corridors with marble surrounds. The walls and ceilings generally were plastered, and some of the rooms and staircases were panelled out in this material, with certain parts enriched, while oak panelling had been adopted in the committee suites of the Gas and Education departments. The lower part of the Gas Department entrance hall and the dadoes to the main staircases to the other departments had marble linings, echaillon bands, and alabaster fillings to the latter and Hopton Wood stone to the former. The principal staircases also had echaillon treads, risers, and strings. The art galleries were lighted by day on what might be described as the ceiling light principle as against the lantern light. This system was not adopted until exhaustive inquiries and research had been made. Further, they would realise the lantern light presented considerable difficulties of construction, added to which they had very much involved the problem of heating and ventilation. The heating of the building was by low-pressure hot water mechanically circulated—a very simple and trustworthy method. The ventilation was generally for the offices by means of extracts in the rooms into ducts over the corridors, with upcast shafts at intervals, finishing at the top with fan chambers. The art galleries had the glass of the ceiling lights slightly raised on fillets and extract fans in the gables exhaust from the roof spaces. The only downward ventilation was in the large gas office, where a large extract fan adjoined the base of the chimneystack, the foul air being forced up around the smoke flue from the boilers.

As to the difficulties, or hindrances, attending modern building methods, it seemed to him one difficulty was the want of pulling together as it were, at times, of the many apparently inevitable sub-contractors. Too often they did not care one whit for their neighbours, and to blame the other man always appeared to be sufficient excuse. A capable foreman or superintendent could help to obviate a good deal of the friction, but he was often too occupied with looking after his own firm's particular interest, which was not always identical with that of the sub-contractor, whose lot on the job was not always a happy one. Again, another difficulty was that resulting from the necessity of obtaining competitive estimates for every sort and kind of thing. This did not conduce to good work—estimates were cut too fine, with the result that the contractor was unwilling to make the slightest alteration, or improvement, except with the most extravagant claim for extras. All this entailed great trouble and expenditure of time on the part of the architects, which might be employed far more profitably in striving to perfect their work.

Mr. Whitworth Wallis proposed a vote of thanks, and said, as to the bridge in Edmund-street, that the disciples of Ruskin were down on it, and all sorts of criticisms had been passed

Birmingham Municipal Buildings Extension.
Messrs. Ashley & Winton Newman, Architects.

on that part of the structure. Personally, however, he did not care at all what the bridge was outside so long as it was beautiful within, and he could assure them that they had in it one of the most charming entrances to any art gallery he was acquainted with.—Mr. Thornley, of Liverpool, seconded. The motion having been carried, Mr. Newman replied, and defended the bridge as supplying a stone connexion between the old and the new buildings.

ARCHITECTURAL SOCIETIES.

The Leeds and Yorkshire Architectural Society.

A general meeting of the Society was held on Thursday, February 22, the President, Mr. Sydney D. Kitson, in the chair.

The feature of the evening was an exhibition of drawings from the Liverpool School of Architecture, and Professor C. H. Reilly, M.A., A.R.I.B.A., gave an informal lecture on the methods of the school.

The large number of students and members present indicated the considerable interest taken in their work, and the debate which followed the lecture concluded a very interesting and successful meeting.

York and Yorkshire Architectural Society: William Etty, R.A., 1787-1849.

On February 28, before this Society, Mr. G. W. Milburn, of York, read an interesting paper on the "Life and Work of William Etty, R.A., 1787-1849." Mr. A. B. Burleigh, Lic.R.I.B.A., being in the chair. In the course of his remarks he said:—

"In this lovely old city of York, with its memories and associations, the mind is led backward two thousand years, linking together the Early Britons, Romans, Danes, Saxons, Normans, and citizens of to-day. Landmarks, fine buildings, and written records of men and manners have been left to us. Illustrious characters, such as Agricola, Heidrian, Constantine, St. Paulinus, St. Wilfrid, and Alcium for learning; whilst for art the names of Flaxman and Etty stand out conspicuously. Imagine to yourselves York without its William Etty, whose name and beautiful pictures are known and appreciated by every lover of choice and artistic work. His fine style of flesh painting is unsurpassed, whose noble conceptions are of the highest order of merit, and not, I think, unworthy of rank with the greatest masters of antiquity. Such a youth was the son of a York miller, a working printer on a newspaper, a Royal Academician, living a blameless life, who grew to be a kind and gentle old man, and an amicable and generous teacher of York art students. The exquisite sweetness of his expression, his firm and resolute chin, the feature which appears to balance the thought which his mind had conceived; his nose, the born artist's nose gracefully arched and strong, clearly defined—the Napoleonic nose, which adds so much beauty and character to the face; his dark-blue eyes, nestling under the projecting brows, in softened violet-tinted shadows, luminous and bright, watchful and steady eyes.

In speaking of his pictures, Etty was thirty-four years of age when Napoleon died, 1821, and the death of such a mighty military genius would appeal to a sensitive nature like Etty's, and in all probability the outcome of his thoughts was the picture of "The Combat," or "Mercy Pleading for the Vanquished." This ranked as the noblest of Etty's productions, a painting that would do credit to any country; one of the finest of historical talent that the English school had yet produced for accurate drawing and beautiful colouring. From his youth he always thought to be an artist. After serving his apprenticeship as printer on the *Hull Pacquet*, he went to London to stay with his uncle, and later was a student at the Royal Academy schools, and eventually under Sir Thomas Lawrence. He thought long over his pictures, but executed them quickly. He succeeded John Flaxman as R.A. in 1828. He would generally spend the first and second evenings in making a charcoal outline, then go over the sketch with ordinary pen and ink, and then commence to paint. The York School of Design was founded by Etty (and one of the first provincial schools, 1842). It commenced in the Hospitium in St. Mary's Abbey ground, York. Among his first pupils was the family of the Moores. It was a custom of William Etty to take a female Torso, place it in a convenient position, draw it for the students, then add other limbs to complete the figure, and show them how to drape it. He died at York in his sixty-third year. Whilst painting in Venice a Professor came up, and, after looking at Etty's picture, said, "Were I to prick the canvas it would bleed."

At the conclusion of the paper a hearty vote of thanks was proposed by Mr. J. Windass and seconded by Mr. Harold E. Henderson.

Glasgow Architectural Craftsmen's Society.

At a meeting of the Technical College Architectural Craftsmen's Society, Mr. James S. Boyd presiding, Mr. James Muir lectured on the management of Building Contracts. The lecturer stated that a business and architectural training was absolutely necessary to the contractor who was entrusted with difficult and costly work. Thus he would be enabled to give satisfaction to his client and earn profit for himself. The lecturer also dealt with the terms laid down in schedules in adjustment of claims for extras, etc., and stated that no contract of any kind gave satisfaction unless the utmost harmony was maintained between the contractor and those who superintend the works.

A paper was read on the 29th ult. before the Society by Mr. Robert Moon on "Various Timbers and their Practical Uses." The lecturer referred to the rapidity with which supplies of the timbers presently in use were being exhausted, and confined himself mainly to the woods of the future which must come from the giant forests of Western America. These, with the opening of the Panama Canal, should be placed on the British market in greater quantities and at lower rates.

Architectural Association of Ireland.

A general meeting of this Association was held recently in the Lecture Hall, 15, South Frederick-lane. The President, Mr. Page L. Dickens, M.R.I.A.I. occupied the chair. Mr. Connor O'Brien read an interesting paper, entitled "The Development of a National Style of Gothic Architecture in Ireland," which was illustrated by numerous photographs and lantern views of the principal ecclesiastical buildings erected in Ireland between the XIIth and XIVth centuries. Mr. Connor O'Brien found a precedent for the development of a national Gothic style in the work done in Ireland during the XIIIth and XIVth centuries, when great originality of design and independence of treatment were shown by the Irish builders. The lecturer also called attention to the excellent carving and workmanship to be found in many of the tombs and memorials to the dead in our abbeys.

In proposing a vote of thanks to the lecturer, Mr. R. M. Butler, M.R.I.A.I., suggested as an explanation of the great difference in detail and treatment often to be found in buildings of the same period in Ireland that many of these buildings owed their erection to the English colonists, and so naturally differ in their details and mouldings from those built by the Irish people.

Mr. Geo. L. O'Connor briefly seconded the vote of thanks, which was supported by Mr. P. J. Lynch, M.R.I.A.I., and Professor Scott.

GENERAL NEWS.

Professional Announcement.

Mr. Drinkwater Butt, F.R.P.S., architect and studio specialist, has removed to No. 2, Margravine Studios, Baron's Court, W.

Mr. Pierpont Morgan's Collection.

As was provisionally announced on February 2, the silversmith's work forming part of the collections lent by Mr. Pierpont Morgan to the Victoria and Albert Museum is the second portion of that collection being withdrawn.

The Galilee Chapel at Durham.

The Council of the Durham College have, it is stated, been warned by the Dean and Chapter of Durham Cathedral that the condition of the Galilee Chapel is such as to render its use unsafe, and the daily services will be held in the nave of the Cathedral.

Peabody Buildings.

From the forty-seventh annual Report of the Governors of the Peabody Donation Fund we read that the surplus income for the year, from rents and interest, was 43,551*l.* 17s. 5d as shown by the accounts, this return bei 2·53 per cent. on the capital of the Fun against 2·36 per cent. last year. The ni blocks of self-contained tenement buildin at Camberwell-green have been complete and are fully occupied. Good progress h been made with the twelve blocks of se contained tenement buildings at Lillie-roa Fulham. It is hoped they will be rea for occupation early in the summer. Buil ing operations will be commenced at t Vauxhall Bridge-road site in February a at the Walworth site in the autumn. Co sheds have been erected on thirteen of t estates, and the amount of coal sold to t tenants, at 1s. per cwt., during the ye was 2,581 tons. At the end of the year t Governors had provided for the artisan a labouring poor of London 14,312 rooms, i cluding those occupied by the superinte dents and porters, besides laundries a lavatories. These rooms comprised 6,0 separate dwellings—viz., 300 cottages of fi rooms, eighteen tenements of five roo (superintendents' quarters), 129 tenements four rooms, 1,952 of three rooms, 2,658 two rooms, 954 of one room, and nine sho with seventy-one rooms attached. The arch tect to the company is Mr. Victor Wilkin Adelphi, W.C.

The East End Dwellings Company.

In submitting the report and accounts the twenty-ninth ordinary general meeti of the East End Dwellings Company t directors state that the rents received in 191 without taking into account Hastings Hous and the Victoria Park-square Estate (o property), were 36,593*l.* 16s. 1d., as again 36,098*l.* 13s. 3d. in the previous yea Hastings Houses, which were acquired August, 1910, show excellent results and we completely occupied at the end of the year, were also Stafford Houses, Thornhill House and the Globe-road Cottage Estate. T letting of the block buildings in and ne Victoria Park-square somewhat improved, t unlet tenements on December 31 being fift nine against seventy-two at the end of 191 Including 646*l.* 8s. 9d. brought forward fro 1910, the profit and loss account shows credit balance of 13,541*l.* 16s. 7d. Out this sum 3,000*l.* (as against 2,000*l.* for 191 has been carried to reserve, which now amoun to 59,000*l.*, and interim dividends for the fi half of 1911, at the rate of 4*l.* and 5*l.* per ce per annum on the preference and ordina shares respectively, have been paid. The dire tors now recommend a similar distribution f the half-year ending December 31, 1911. Afte allowing for these dividends, and also f directors' and auditor's fees, a balance 836*l.* 0s. 7d. will remain to be carried forwar

Property Sales.

Recent sales comprise "Kelston," Nethe hall-gardens, South Hampstead, which w built after Mr. R. Norman Shaw's desig for the late Edwin Long, R.A., and ha been purchased by Sir Edward Elgar, O.M. No. 26, Park-lane, erected for the late M Alfred Beit in 1895-6 from the designs o the late Colonel Eustace Balfour and Mr Thackeray Turner; and Burford Priory Oxfordshire, bought by Mr. E. J. Hornima L.C.C., which is depicted by Waller in hi picture of "The Empty Saddle." Th Priory represents the St. John's Priory appurtenant to the wealthy Abbey of Blac Canons, at Eynsham, dedicated to the Virgi and SS. Peter and Paul, and founded in o about 1170 by William, Duke of Gloucester Edward Harman built, shortly after it Dissolution, the house which Sir Lawrenc Tanfield, Chief Baron of the Exchequer 1607, bequeathed, with the manor, to hi grandson Lucius Carey, Viscount Falkland who fell at Newbury, having previously sold the estate to Speaker Lenthal; Lentha enlarged the house and built the chapel Colonel B. de Sales La Terriere made many improvements and restorations; in the gar den is a fine Jacobean summer-house, and a the Home Farm are Kitts' Quarries, whic supplied some stone for the interiors o Westminster Abbey and St. Paul's. Amongs the properties recently placed in the marke are Weavers' Hall, Basinghall-street, rebuil in 1856 for the Company, and now let in suites of offices at an aggregate rental o

03*l.* 10s. per annum; "Belmont," Mill l, Vicar's Hill, Lymington, Hants, and 33, Bedford-square, W.C., built and orated originally by the brothers Adam; Rougement Estate, Exeter, embracing tions of the old castle moat and city walls; ir Drummond, Perthshire, 7,425 acres, a for some centuries past of a branch of house of Drummond; and Ancaster se, Richmond-hill, having a main front- of 200 yds., close to the Park gates (1798), ch, originally a shooting-box of the Duke Ancaster, was given by George III. to Lionel Dayrell.

Woman and the Cold House.

nder this heading the *Ironmonger* for uary 27 makes some comments on the espondence in the Press on the subject of houses, concluding with the following arks:—"The outstanding point about the espondence is the interest evinced by nen in the question and the total absence any reference to our ancient friend the erful British fire.' Time was when we ght our architects might learn to reciate the advantages of central heating the home. We even dared to hope that would lend their aid to convert the nenfolk, but now the tables seem likely be turned. The scant attention given by architectural profession to Mr. Barker's nt. lectures, which were addressed par- larly to them, the marked preference they lay as a class towards plumbers as dis- uished from hot-water fitters, and the eral neglect of the problem of warming he 'Home and House' books which have such a feature of the publishing trade ng recent years, almost lead us to despair ny improvement in that quarter. Those can influence public opinion might do se than try to capture the Press which eals especially to women. Make the sewives of this country believe they can money, spare their servants work, and erve the decorations of their rooms by sting upon a better system of warming that now in common use, and they will and such a system. Then the architects have to obey."

London Institution, Finsbury-circus.

a "Note" on December 8 we adverted the contemplated adaptation of the uises of the London Institution for pur- s of a School of Oriental Languages, gave a short historical account of the itution and its buildings. A formulated me has been since approved by the ernment, and the Board of Proprietors unanimously adopted a Report to be d to the general body of proprietors members. Subject to the passing of a ial Act of Parliament, the scheme pro- s for the establishment of "The London itution for Oriental Languages," by l charter, and under the control of a n governing body; the transfer of the hold property and effects, and discon- ance of the existing circulating library; grants from Government of from 20,000*l.* 5,000*l.* for repairs, improvements, and tional buildings, and for an annual me, towards which the Government ave ed to contribute 4,000*l.* per annum. essor F. M. Simpson has prepared plans altering the premises, at a cost of some 00*l.*, in furtherance of these proposals.

University Buildings, Belfast.

he authorities have resolved to proceed with with the enlargement, at an esti- d cost of some 10,000*l.*, of the Queen's versity Library, after designs by Mr. H. Lynn, R.H.A., of Belfast, Architect he University. Mr. Lynn made the plans designs for the additions to the students' n block and to the medical school, and the new south block, as well as for the hall and rifle range, Queen's University, which tenders, to an aggregate sum of ly 35,000*l.*, were accepted in July of last

CORRESPONDENCE.

The Associates and the R.I.B.A.

R,—Your article, "The Associates and R.I.B.A.," induces me to submit the wing statements:—

Many Associates desire to remain Asso- s because the title indicates something which is perfectly clear and definite. They have passed an examination in architecture. This examination may be feeble, and parts of it may be absurd, still, Associateship indicates definitely and clearly that an examination in architecture conducted by a Royal Institute has been passed.

(2) Fellowship may, some day, indicate something just as clear and definite and something far more important than the passing of an examination, but at present it does not. It indicates all kinds of interesting things, but nothing clear and definite.

(3) The Associate who has qualified for Fellowship by having been engaged as a principal for seven years knows that at any time, should it be to his interest to do so, he may become a Fellow, and for this reason, and for those given in (1) and (2), he remains an Associate.

(4) When the Institute tackles the question of architectural education and examination seriously it will discover—what it discovered in part long ago—that while the present examinations for Associateship can be made vastly sounder and improved in many directions, they can contain nothing to which a great learned society should refer to as "advanced work."

(5) It may then be thought advisable to make the doing of some "advanced work" necessary before an Associate who has already "shown himself to be possessed of a solid groundwork of knowledge" may proceed to a Fellowship.

It is not possible in a letter to deal in detail with the nature of this "advanced work." It should be something more than "having been engaged in practice as a principal for seven years"—in fact, as suggested in your article, it should be possible for a man to become a Fellow without having engaged in practice.

The following may be suggested as types of "advanced work":—

(*a*) The designing and carrying out of buildings which can reasonably be considered to add to the beauty of one or more of our villages, towns, or cities.

(*b*) The investigation of some of the scientific problems which are inseparable from architecture.

(*c*) The doing of work which will add to our knowledge or understanding of the architecture of the past or which will enable us to grasp more clearly the elusive quality of beauty in architecture.

(6) If such a scheme as that I have indicated were carried out in the right spirit, in the course of, say, twenty to thirty years, it would be decidedly worth while for an Associate to strive for the Fellowship, for then the letters F.R.I.B.A. would be as valuable to the architect as the letters F.R.S. are to a scientist.

And, I suppose, being known as F.R.S. is, to the scientist, almost as good as being known by his surname alone, which is, after all, the greatest distinction it is possible for a community to give to one of its members. W. S. PURCHON.

Padbury *v.* Holliday, Ltd.

SIR,—The letter of your correspondent, Mr. F. J. Gayer, has again opened up the differences between the contractor and the sub-contractor.

Your correspondent suggests that a proper contract between the parties is necessary. That is agreed; but the original contract should form the basis of agreement. Is the contract he wishes to put in force the one issued by the Institute of Builders, which stipulates that the contractor shall be judge of the specialists' manufactures with power of rejection and with other clauses placing him in the grip of the contractor, finally providing that the contract shall override the principal contract and referring dispute to the arbitrament of the President of the Institute of Builders or someone appointed by him? No, Sir. The sub-contractor prefers that the architect shall hold the balances fairly against all parties, and rightly objects to being placed at the absolute mercy of the contractor who may be, and often is, more or less of a financial corporation, squeezing and greedy for discounts, or, as is sometimes the case, men without means trading on advances due to the sub-contractor.

Sub-contractors, in the vast majority of cases, have, by business enterprise, laborious study of the special manufactures in which they are interested, and at an enormous expense in the development of a high standard of perfection, rightly come to the front. To them, and to the appreciation of their efforts by the architectural profession (whose ideas they so readily carry out), is due the wonderful improvements in modern building which makes for comfort and economy. Take, for example, reinforced concrete, constructional ironwork, heating, sanitation, ventilation, and like matters. How many of the improvements have been brought about by builders?

A glance at the advertising pages of this journal will at once show that building specialists are a real live force, of standing and credit, and it is not likely that they will consent to be placed under the heel of the contractor.

In many buildings of the best description where a client employs his own labour, under the directions of an architect, and a general contractor is dispensed with entirely, the work proceeds smoothly; the client gets good value too, as the specialist can quote his best prices—with no margin for discounts and uncertainty of payment—and the work is properly carried out to the satisfaction of everyone.

These are days of organisation, and it is time that sub-contractors formed an association for the protection of their interests.

SUB-CONTRACTOR.

Thames Flooding.

SIR,—Whether flooding in the upper reaches of the Thames is preventable in normal years is obviously a question for engineers. The Thames Conservancy have complete data for the rainfall over the area drained by the river, and the volume of water passing down per second can be easily gauged at the weirs. Were the numerous artificial barriers in the form of locks and weirs, intended to retard the flow, thrown open, the Thames would become an impetuous torrent, as when its extensive beds of gravel were forming, instead of a navigable river. By manipulating the barriers scientifically it would seem that floods should become impossible. Alternatively to raise the banks where they are exceptionally low, dredging the material in part from the river bed, would present no vast difficulty or cost, and have been long since carried out had the Thames been an Indian or Egyptian river. In the meantime each township might reasonably follow the example of Windsor and places below Teddington, and protect themselves. The Town Council of Maidenhead, however, allow an overflow from Cookham to pour into the low-lying quarters of the town, which are inhabited by the poor, whose tenements are submerged annually, bringing unspeakable misery for the time on them, with hopelessly insanitary conditions. A second torrent pours over the tow-path above Boulter's lock, at a point where it is exceptionally low, and devastates the gardens of Maidenhead Court, Wray Park-avenue, etc., for nearly a mile before it re-enters the river near the bridge. Year after year the town is held up as an object-lesson by the London Press in a manner most damaging to its residential repute, and it might be thought that self-interest, if nothing higher, would induce the leading tradesmen on the Council to set about a remedy; the more so as it would involve a relatively small outlay. The required embankments are, in fact, by no means extensive or costly. But their discussions, as reported, are inconclusive and abortive, and for years have had no practical results, and no wonder! One Councillor's dictum is that "they knew perfectly well that all the wise men on earth would never keep out the water from Maidenhead as long as the present levels exist," while another objected to any embanking "for the reason of the inconvenience it was likely to cause to the people residing at Bourne End." It is a strange state of things that "Aldermen" and "Councillors" should be found within half-an-hour of the metropolis, in these Board School days, discussing so serious, but really so simple a matter in such a spirit. A trip to Holland, or even to the Nore or the East-end, would afford ample object-lessons as to the value of embankments. Further comment is unnecessary, but it is evident that some higher authority should exist, capable of bringing these gentlemen to a sense of their obligations. J. STARKIE GARDNER.

EDITORIAL SUMMARY.

Our leading article, "Hospital Competitions," deals with an article in the last issue of our contemporary, the *Hospital*, as to Hospital Competitions in general and the recent East Sussex, Hastings, competition in particular. We quote at length from our contemporary on another page (p. 279).

"The Text-Book" is the title of a second article (p. 260). It is a review of Professor F. M. Simpson's recent work on "A History of Architectural Development: Vol. III.—the Renaissance in Italy."

In "Notes" Column (p. 262) will be found comments on: "The Lady Architect Again"; "Associates and the R.I.B.A."; "The Attitude of the Associates"; "The Hampshire Association of Architects"; "Publication of Speeches in the R.I.B.A. *Journal*."

An illustrated report of the lecture at Carpenters' Hall by Mr. W. H. Bidlake, M.A., on "Mediæval Sculpture" appears on p. 263.

"Industrial Unrest" is the title of an article on p. 265.

Some notes on the opening up of Southwark Cathedral are given on p. 265, together with an illustration.

An abstract of a lecture on "The Restorer and his Attitude toward Old Work" is given on p. 266.

Some notes on the Birmingham Council Chamber Extension will be found on p. 267.

Architectural Societies (p. 268) include: "Glasgow Architectural Craftsmen's Society"; "Architectural Association of Ireland"; "York and Yorkshire Architectural Society"; "Leeds and Yorkshire Architectural Society."

In Correspondence columns (p. 269) will be found letters on: "The Associates and the R.I.B.A."; "Thames Flooding"; "Padbury *v.* Holliday, Ltd."

The Monthly Illustrated Review of Construction (p. 271) contains: "The London Opera House"; "A New System of Reinforced Brick Flooring"; "New Offices for the Metropolitan Railway"; "Ventilation"; and Notes.

The Building Trade Section (p. 275) includes: "Manchester Building Trades' Exhibition"; "London Master Builders' Association"; "Portsmouth Master Builders' Association"; "Projected New Buildings in the Provinces"; "Applications under the London Building Acts," etc.

Book Notices (p. 231) include: "Baroque Architecture and Sculpture in Italy"; "Old Houses of Shrewsbury"; "Our Homeland Churches and How to Study Them"; "The Year's Art"; "The Antiquary," etc.

In Legal Column (p. 282) will be found some observations on: "Workmen's Compensation" and "London Drainage By-Laws."

In Law Reports (p. 282) will be found: "John Aird & Co. *v.* The Corporation of Bristol."

MEETINGS.

FRIDAY, MARCH 8.

Royal Sanitary Institute.—Provincial sessional meeting, Municipal School of Technology, Sackville-street, Manchester. (1) Discussions: "The Application of the Housing and Town Planning Act to the Redevelopment of Suburban Areas now in Process of Transition," to be opened by Mr. F. W. Platt, building surveyor, Salford; (2) "The Quantity of Water Available from Upland Drainage Areas," to be opened by Professor J. Radcliffe, M.Sc.Tech. The chair will be taken at 7.30 p.m. by Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Institute.

Leicester and Leicestershire Society of Architects.—Mr. Walter Gilbert on "Metalwork." Lantern illustrations. 8 p.m.

Royal Academy of Arts.—Mr. A. P. Laurie, M.A., D.Sc., on "The Chemistry of Building Stones and Cements." 8 p.m.

Royal Sanitary Institute.—Mr. Edward Willis, Assoc.M.Inst.C.E., F.S.I., on "Building Materials." 7 p.m.

SATURDAY, MARCH 9.

Royal Sanitary Institute.—Members meet at St. Margaret's Church, Prestwich, at 1.45 p.m., and proceed to inspect the new service reservoir at Heaton Park, under the guidance of the resident engineer. 3 p.m.—The party will proceed to the new lake to inspect the works.

Royal Institution.—Professor Sir J. J. Thomson, M.A., LL.D., D.Sc., F.R.S., on "Molecular Physics"—III. 3 p.m.

Builders' Clerks' Benevolent Institution.—Theatrical performance at the Royal Court Theatre, Sloane-square, by the "Strolling Players" Dramatic Society, in aid of the funds of the Institution.

MONDAY, MARCH 11.

Architectural Association.—Mr. C. C Brewer and Mr. C. A. Daubney on "American Architecture." 7.30 p.m.

The Surveyors' Institution.—8 p.m.

Royal Sanitary Institute.—Mr. H. Phillips Fletcher on "Building Sites and Local Physical Conditions." 7 p.m.

Institute of Sanitary Engineers.—Mr. Percival M. Fraser on "The Modern Home." 8 p.m.

The Incorporated Clerks of Works' Association (Carpenters' Hall, London-wall).—Paper by Mr. H. Fincham on "Canterbury Cathedral." 8 p.m.

TUESDAY, MARCH 12

Royal Sanitary Institute (90, Buckingham Palace-road).—Mr. R. Herzfeld, Ph.D., on "Combined Hot-Water and Electricity Supply for Private Houses." The chair will be taken at 8 p.m. by Sir William Emerson, F.R.I.B.A.

Northampton Polytechnic Institute (Illuminating Engineering).—Mr. Val. H. Mackinney on "The Practical Use of Metallic Filament Glow Lamps." 7.30 p.m.

The Institution of Civil Engineers.—Discussion on "Roller and Ball Bearings" and "The Testing of Anti friction Bearing Metals," by Professor John Goodman, M.Inst.C.E. Papers on "The Main Drainage of Glasgow," by Alexander Beith McDonald and Gotfred Midgley Taylor, MM.Inst.C.E.; "The Construction of the Glasgow Main-Drainage Works," by William Cecil Easton, B.Sc. M.Inst.C.E.; "Glasgow Main Drainage: The Mechanical Equipment of the Western Works and of the Kinning Park Pumping-Station," by David Home Morton, M.Inst.C.E. 8 p.m.

WEDNESDAY, MARCH 13.

Carpenters' Hall, London-wall (Lectures on Arts Connected with Building).—Mr. W. Curtis Green on "Roofs and Roofing." 7.45 p.m.

Royal Society of Arts.—Professor Ernest A. Gardner, M.A., on "Greek Sculpture." 8 p.m.

Royal Sanitary Institute.—Mr. H. Phillips Fletcher on "Building Construction and Sanitary Planning." 7 p.m.

Edinburgh Architectural Association.—Mr. F. C. Eeles on "The Gothic Chancel." 8 p.m.

THURSDAY, MARCH 14.

Carpenters' Hall, London-wall.—Mr. A. G. Temple, F.S.A., on "J. M. W. Turner, R.A." 8 p.m.

Society of Antiquaries. 8.30 p.m.

The Concrete Institute.—Discussion on the Interim Report of the Tests Standing Committee of the Concrete Institute on "The Testing of Concrete, Reinforced Concrete and Materials Employed Therein." 8 p.m.

FRIDAY, MARCH 15.

Institution of Mechanical Engineers.—Dr. Rudolf Diesel on "The Diesel Oil Engine." 8 p.m.

Royal Sanitary Institute.—Mr. H. Phillips Fletcher on "Ventilation, Warming, and Lighting." 7 p.m.

Glasgow Architectural Craftsmen's Society (Technical College).—Mr. A. H. Purdie on "Some Practical Considerations on the Measuring and Valuing of Mason and Brickwork."

South Western Polytechnic Institute, Chelsea.—Sir David Gill, K.C.B., F.R.S., will present prizes and certificates to students of Evening Classes and Day College. 8 p.m. (Laboratories and workshops open to public inspection at 9.15 p.m.)

COMPETITION NEWS.

Oakwood-avenue Council School, Warrington.

Members and Licentiates of the Royal Institute of British Architects are asked not to take part in this competition because the conditions are not in accordance with the published regulations of the Royal Institute for architectural competitions.

Blackwood Hall.

Members and Licentiates of the Royal Institute of British Architects are asked not to take part in this competition because the conditions are not in accordance with the published regulations of the Royal Institute for architectural competitions.

Town Planning in Huddersfield.

Mr. W. P. Raynor, J.P., has addressed a letter to the Chairman of the Housing and Town Planning Committee of the Huddersfield Corporation stating that he is authorised to pay over 100*l.* to be devoted to acquiring by open competition a scheme of planning and housing applicable to the local needs. The matter is under the consideration of a sub-committee.

ENGINEERING SOCIETIES.

The Society of Engineers.

The Council of the Society of Engineers (Incorporated) may award in 1912 two premiums of books or instruments to the value of 8*l.* and 4*l.* 4s., as first and second prizes respectively, for approved essays on the subject "How to Improve the Status of Engineers as Engineering, with Special Reference to Consulting Engineers." The Council reserve the right to withhold either or both of the premiums if the essays received are not of the required standard of merit. The competition is open to all, but application for detailed particulars should be made to the Secretary before entering. The last date for receiving essays is Friday, May 31.

The Junior Institution of Engineers.

A booklet has been issued by this Institution dealing with "Its Origin and Aims." In the paragraph dealing with the inception of the Institution it is interesting to note that the Society came into being at the works of the late firm of Messrs. Maudsley, Sons, & Field, London, in 1884. Amongst the officers, Presidents, and Vice-Presidents the names of many famous men can be noticed in the list that is given. Mention is made also of honorary members, one of whom generally gives a lecture each year, many of the discourses thus delivered having merited and obtained world-wide renown. The rooms are kept open on Friday evenings during the months of October to May inclusive, in order that the weekly periodicals can be perused and social intercourse promoted. In connexion with each Friday evening the opportunity is taken for the discussion of various subjects in a very informal sort of way. A copy of the booklet may be obtained free on application to the Secretary, 39, Victoria-street, Westminster, London, S.W.

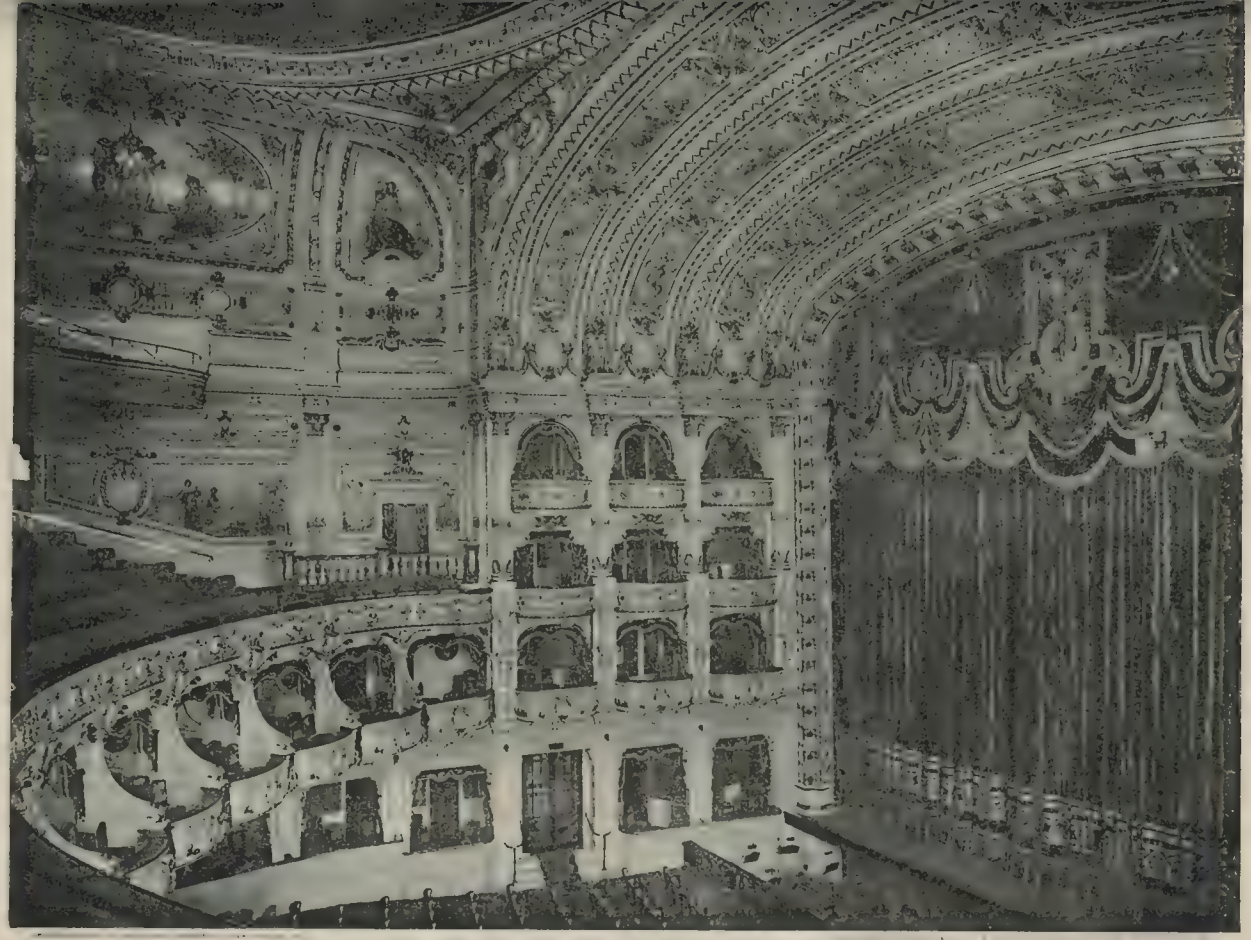
The London Opera House.

THIS imposing building in Kingsway is illustrated by two of our plates and is described partially in the article beginning on p. 271, where other illustrations will be found.

Mediæval Sculpture.

THESE illustrations are given in connexion with the lecture by Mr. W. H. Bidlake, M.A., on "Mediæval Sculpture" at Carpenters' Hall, a report of which appears on another page.

FIFTY YEARS AGO.



From the *Builder* of March 8, 1862.

American Liberality.

WE learn that Mr. Peabody, the well-known American banker in England, being about to quit the country with a large fortune realised here, has decided on erecting a number of houses for the working classes who through the innumerable improvements in the metropolis, have been rendered almost homeless. For this purpose he gives a hundred thousand pounds, and also undertakes to pay the first year's interest of the money—five thousand pounds.

MONTHLY REVIEW · *of* · CONSTRUCTION.

The Stalls Saloon.

THE LONDON OPERA HOUSE.—I.

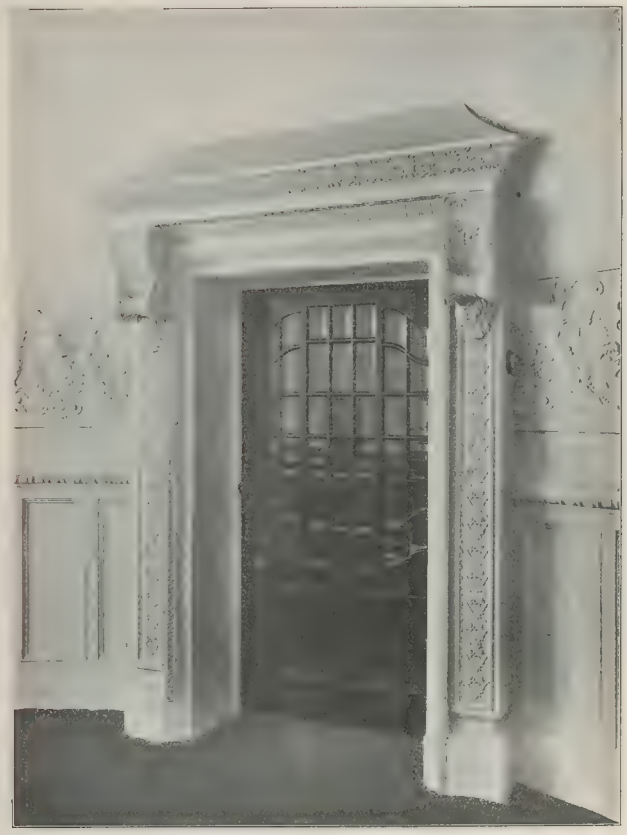
GENERAL DESCRIPTION.

UATED near the southern end of Kingsway, the new opera house built for Mr. scar Hammerstein from the architecesigns of Mr. Bertie Crewe stands sland site with frontages of 264 ft. to y, 120 ft. to Portugal-street, 37 ft. to -street, and 90 ft. to Sardinia-street, art of the building abuts on the of the Strand Board of Guardians. lection of the site, covering an area of 5,000 sq. ft., indicates due appreciation ct that an important theatre or opera ould be placed so as to be readily e from all sides. Every advantage has en of the four street frontages in arrangntrance and exit doors. The house can ied in three minutes, and hundreds nges can be accommodated in the ing streets.

terior of the building is treated somethe French Renaissance style, the main eing divided into two stories, each 0 ft. high. The lower story is heavily d, and the lines of the upper story are by coupled Corinthian pilasters, the capitals having square volutes. A t feature of this façade is a central 9 ft. high.

ingsway elevation, as well as return s of 50 ft. on Portugal-street and street, are based on a plinth of n grey granite rising to the height of e pavement level, supplied and worked s. A. & F. Manuelle, of 57, Gracereet, E.C. The corresponding façades ortland stone from the Coombefield of the Bath and Portland Stone Firms, Bath. More than 60,000 cubic ft. of tone were supplied by the company, he blocks weighing upwards of 8 tons

maining façades of the building are cherry-red facing-bricks with stone string courses, and cornice. These pplied by Messrs. T. Lawrence & Sons, hell, are made from a bright-coloured fil among the Bagshot sands, and giving int by which they are characterised. he main cornice on the Kingsway front twelve statues have been placed under the direction of the sculptor, Mr. Thomas Rudge, of Clapham. At one end of the building a group of three figures represents "Melody," while at the other end "Harmony" is similarly represented. The central figures are about 14 ft. high, and the weight of each group is fully 40 tons. Over the central window there are two seated figures representing "Inspiration" and "Composition," and four other single statues denoting "Comedy," "Tragedy," "Song," and "Dance," are disposed at suitable intervals on the cornice. These statues weigh about 15 tons each, some of them comprising two and others three blocks of stone.



An auxiliary structural feature of the Kingsway front is the wrought-iron glazed verandah extending over the street pavement for the shelter of persons entering or leaving the building.

From the foregoing particulars the reader will be able to gather a general idea of the structural aspect of the exterior, and from the accompanying illustrations to form an opinion of its architectural merit.

The main entrance is at the south end of the Kingsway front, a flight of marble mosaic steps leading thence to the vestibule and booking offices. The entrance vestibule has an arched imitation stone coffered ceiling to match the stone arch outside. Over the door a large panel is covered by an oil painting of Pan attended by maidens. The entrance hall, arranged as a lounge, measures 60 ft. long by 30 ft. wide by 21 ft. high, and is surmounted by a peristyle of Corinthian columns supporting a heavily-beamed and coffered ceiling. The walls are handsomely panelled in plaster, the panels being decorated by medallions representing eminent musical composers. From the entrance hall two marble staircases lead down to the stalls on the floor below, and a marble-panelled stairway gives access to the grand circle and galleries.

The interior of the house may be considered as divided into three portions:—(A) Comprising entrance hall, stairways, corridors, saloons, and other accommodation for the public on several floors; (B) the auditorium, including the stalls, box tier, grand circle, lower gallery, and upper gallery; and (C) consisting of the stage, scenery dock, dressing-rooms and accommodation for the management, staff, and artistes.

In part (A) on the floor below the street level are the foyer and saloon attached to the stalls and boxes on either side of them, and approached by the staircase already mentioned. The stalls saloon has a series of eighteen Grecian columns with heavy cornices and panelled walls, and doorways in the same style. On the ground floor similar accommodation is provided in connexion with the boxes on the first tier, while a private entrance has been arranged for the Royal box. This box is constructed with sliding partitions so that its dimensions can be varied as required. The walls are panelled in silk, with gilt medallions at the crown of the panels, having miniatures of paintings in the Watteau style. The crush hall for the box tier has a cove strap pattern ceiling extending across the whole width of the building; the cornice is a very effective piece of work, and the walls are divided up into panels by pilasters. On the grand circle level a lounge, foyer, and saloon are to be found, the last being an oval-shaped chamber with a domed and coffered ceiling, having fine ornamental frieze and the centre heavily enriched with fruit in plaster. The Grecian doorways constitute an excellent example of plaster work. Above the circle foyer are the lower and upper gallery saloons. All the apartments mentioned, as well as the corridors, stairways, and other accommodation, have been designed with much care for the comfort and, above all, the safety of the public, and in these respects the new opera house will quite bear comparison with the best examples of French theatre architects. The circle is heavily moulded with a large oval; the walls are panelled with cupid drops at intervals; there is also an above with Corinthian columns and ornamental niches. The decorative work, as described above, in the vestibule, entrance hall, crush hall for box tier, stalls saloon, grand circle and circle saloon was executed by Messrs. John Tanner & Son, of Liverpool, and 45, Horseferry-road, Westminster, S.W.

The Domed Saloon (Doorway to Exit Corridor).

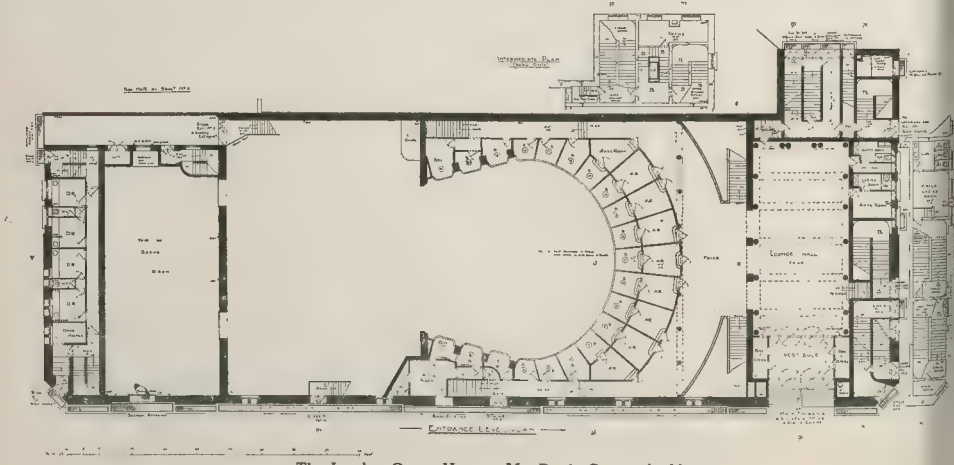
The auditorium proper is 85 ft. wide by about 100 ft. long, the length varying on the different circles. Below the street level the space available is devoted entirely to stalls and eight private boxes on either side; the floor sloping upward from the orchestra at such inclination that the occupants on every row of seats have an unobstructed view of the stage. At the entrance level there is a semicircular tier of private boxes, each with a retiring-room, including the Royal box and suite of apartments placed at the O.P. side of the proscenium in order that direct access may be obtained from the Royal entrance on Kingsway. Two other ranges of private boxes are situated on the same level, one on each side of the auditorium.

Above the box tier is the grand circle, with fourteen tiers of seats and eight boxes at the sides; the lower gallery with eleven t seats and six boxes; and the upper galle eleven tiers of seats.

The auditorium is constructed enti fire-resisting materials. The circles ar are of steelwork and concrete; all doors hardwood, self-closing and smoke-proo the proscenium opening is fitted with a curtain, built of steel and asbestos, w case of fire will be lowered and autom flooded with water. As additional precs an automatically-opening lantern light h provided in order to draw away heated smoke from the stage in the event of fire hydrants and other fire-fighting appliance been placed in every part of the buildin

The auditorium is unusually comfo every seat throughout the house being a fa no columns obstruct the view of spectato the sight lines have been carefully s Promenades have been entirely avoided auditorium proper, and enclosing wall been erected behind the circle and galleries prove the acoustics of the house and to p the audience from being disturbed by from the adjoining portion of the bu The total capacity of the house is which compares favourably with the accommodation of other buildings of th class in the metropolis.

The proscenium arch is 45 ft. wide by high, with a funnel-shaped profile inten throw out sound, and the auditorium is s by a rather flat, elliptical ceiling. Al are readily accessible, and the doors are full width of the corridors into which the



The stage is 84 ft. wide by 60 ft. deep, s distance from front to back can be increa nearly 100 ft. in case of need by throwin the partition closing the front of the s dock situated immediately behind the proper. In the same part of the buildi situated dressing, chorus, and other roo well lighted and having access to the op for ventilation purposes.

From the structural point of view the L Opera House is essentially a masonry bu in which steel has been largely used in th of framing for floors, circles, and roofs steel construction, as well as the electric heating and ventilation, and other install present features of interest to which att will be directed in our next issue.

NEW SYSTEM OF REIN FORCED BRICK FLOORI

AS HITHERTO constructed reinforced floors consist of separate panels placed be and supported by rolled steel girder joists, the reinforcement consisting of strip embedded in the vertical joints, are made with Portland cement m Numerous floors have been so built perfect success from the standpoin strength, stability, and resistance to vib sound, and heat.

An improvement recently introduced

points where main girders and joists are connected. Therefore the system of reinforcing members constitute a working platform capable of supporting the moulds and centring for constructing the beams and floor slabs. The reinforcement is not exposed to the risk of accidental displacement, as sometimes happens in the case of reinforced concrete, and the system of rolled-steel joists, in virtue of its load-bearing capacity, is capable of supporting the dead weight of the brick and concrete afterwards added, and moderate working loads in addition, without waiting for the concrete to set.

NEW OFFICES FOR THE METROPOLITAN RAILWAY.

The Metropolitan Railway Company recently placed in competition a certain number of engineering firms specialising in the design of reinforced concrete structures, for the new offices which the company intend to erect on the site of the Baker-street Station. Messrs. Edmond Coignet, Ltd., of Victoria-street, Westminster, have been selected for the preparation of the working drawings, and the work is to be executed on their system under the control of Mr. W. Willox, M.Inst.C.E., Chief Engineer of the Metropolitan Railway Company.

The principal dimensions of this large building, which is to be constructed entirely in reinforced concrete, are as follows:—The total length of the front elevation will be 140 ft., and the height, measured from the foundations to the roof, will be approximately 90 ft. The back portion of the structure will have two wings, measuring respectively 111 ft. in length by 38 ft. in width, and 100 ft. by 43 ft. for the smaller wing, the latter being connected to an existing building by a footbridge 82 ft. in span, 12 ft. wide, and with a height of 15 ft.

A retaining wall in reinforced concrete, of a length of 152 ft., will run parallel to the front elevation. The total length of the retaining wall, including the returns, will be 212 ft., the height being 24 ft.

The walls of the building are to be entirely in reinforced concrete of a thickness of 6 in., and for the principal elevation the wall is to be faced with brickwork.

The building will be composed of a lower basement, basement, booking-hall floor, ground floor, first, second, and third floors, and a flat roof. The superloads, up to the first floor included, are to be 150 lb. per square foot, the second and third being 90 lb. per square foot, and the roof 40 lb. per square foot.

The total superficial area of floors and roof in reinforced concrete will be approximately 65,000 sq. ft.

VENTILATION.

At a meeting of the Royal Society of Arts on the 7th ult. a paper on the "Influence of Ozone in Ventilation," by Dr. Leonard Hill, F.R.S., and Dr. Martin Flack, M.A., was read.

The authors said that the good effects which resulted from efficient ventilation and open-air treatment, though generally supposed to be due to the chemical purity of the air, were due really to the movement, coolness, relative humidity of the air, and the ceaseless variation of these qualities. The ventilating engineer had hitherto followed a great illusion in thinking that the main object to be attained was chemical purity of the air. The heating engineer had sought after an equally great illusion in striving to obtain a uniform summer temperature. The ventilating and heating engineers should aim primarily at giving air which was cool and of proper relative humidity, and which moved so as to vary the cutaneous state of the body. Comfort and

New System of Reinforced Brick Floor.

discomfort in crowded rooms and shut-up places depended, not on the chemical purity of the air, but to a minor degree on the influence of the smell of the air on the olfactory sense, and, to a vast degree, on the influence of the temperature and relative humidity, and the variations of these qualities of the air, which acted on the great field of cutaneous sensibility. The chemical purity of the air might be considered from three points of view—the concentration of carbon dioxide, the concentration of oxygen, and the supposed presence of organic poison exhaled by the breath.

Owing to the fact that a percentage of carbon dioxide exceeding a very few parts per 1,000 was not legally permissible in factories, it was commonly supposed that any greater excess acted as a poison. The truth of the matter was quite otherwise, for whatever the percentage of carbon dioxide in the atmosphere might be, that in the pulmonary air was kept constant at about 5 per cent. of an atmosphere by the action of the respiratory centre. It was impossible that any excess of the gas should enter the body even in breathing the air of the worst-ventilated room, in which the percentage of carbon dioxide assuredly did not rise above 0·5 or at the outside 1 per cent.

The oxygen in the worst-ventilated theatre, schoolroom, or chapel was never lessened by more than 1 per cent. of an atmosphere, but all the evidence went to show that only when oxygen was lowered below a pressure of 14 to 15 per cent. of an atmosphere did signs of oxygen want arise. A diminution of 1 per cent. of an atmosphere had not the slightest effect on health or comfort.

As to the general principles which ought to control the practice of the heating and ventilating engineer, the old English methods of open fire and open window had very much to recommend them. By the open fire air was kept moving and cool air was brought in; the heating was by radiation, and uniformity of the conditions of temperature in the room was prevented. On the other hand, the impulsion of hot air into a room was the most objectionable of all the systems employed. A cool air and radiant heat were the ideal; the hot air system gave neither. In cold weather the heated air became excessively dry; the vigour and health of children in America had been seriously undermined by the impulsion of hot "desert air" into the schools.

In the concluding part of their paper the authors discussed the uses of ozone in ventilation, basing their remarks on experiments carried out with an ozonising apparatus put at their disposal by the Ozonair Company. They stated that by the smell concentrations of ozone of far less than one part in a million could be detected, and the gas should be present in the air for continuous breathing in concentrations not greater than that scarcely perceptible to the smell. Concentrations of even one part in a million were too irritative. Very weak concentrations, barely perceptible to the smell, had no ill effects, but destroyed the effect of unpleasant smells and gave a certain tang or quality to stuffy air which relieved its uniformity. It was in this respect that ozone had its use. There existed in modern conditions of life so many trade shops, tube railways, cold meat stores, etc., where the employees were exposed to a persistent, uniform, and depressing smell. The air in many buildings was made to smell by the heating appliance used. The addition of ozone took away the smell and relieved the monotony of such air, and as the Ozonair apparatus could, by the turning of a switch, be put in or out of use, the uniformity of the atmospheric conditions could thus be frequently changed. The ozone, no doubt, exerted its effect both on the cutaneous and respiratory nerves. They thought that the addition of ozonised air to the Central London Railway had improved the conditions, the unpleasant characteristic smell of the tube being diminished, and the monotonous quality of the air improved.

CONSTRUCTION NOTES.

The Road. SIR JOHN H. A. MACDONALD read a paper before the members of the Royal Institution on the 16th ult. on "The Road: Past, Present, and Future." He said that the problem of the future was to find the best mode by which a road could be constructed which would not have its surface broken by traffic and would make transit easier both for passengers and goods, and should neither form puddle holes nor exude mud to clog the vehicles and to form thick dust when the weather was dry; in short, that there should be no loose material from the road, except the small quantity caused by surface wear, which it was found was but trifling when a sound crust had been rolled in. It might seem extravagant to say that in another decade the main roads would have become practically mudless, dustless, and smooth ways, but if any one had prophesied on the first day of the new century that before twelve years had passed there would be more than 200,000 motor vehicles upon the roads of Great Britain, and that of the 500,000 horses in London 420,000 would have disappeared from the streets, the presumptuous prophet who said such impious things would have been considered fit only for Hanwell or Colney Hatch. Considering what was to be the road of the future, the question, "What shall be the weight-bearing crust?" was one of vast importance, and this was engaging the attention of the advisers to the Road Board. One thing was now universally recognised—that the road of the future should be a truly bound road, in which whatever kind of stone was used that stone should be held together by some pitchy or bituminous material so that it should be indeed a crust and not something which had no real cohesion, and into which Macadam's enemy, the water, could make its way whenever water fell. Roads formed as regards the crust in this way were now common. Many could be seen in Kent and other counties near London, and stretches were being laid throughout the kingdom. Would it not be well to endeavour to provide an elastic skin or carpet to lie between the vehicle and the bearing crust? That question was also engaging attention. A material to be used for an elastic carpet for the road crust must have a viscous liquid quality. Research had been made with pitch and with bitumen, and the conclusion had been reached that pitch would not give satisfactory results, but bitumen would do so. It was expected that with such material laid on the top of the main road crust and integrated with it a valuable road protection would be supplied, so that the road crust would be practically permanent, the upper protecting sheet being re-made up and re-laid as required. To fulfil the ideas of providing a partially elastic carpet which would carry out the silencing of the rolling noise of vehicles and reducing shock, the engineers at the Road Board had already decided on experimental roads which would consist of a strong road crust intended to carry the weight of the traffic, and on this to superpose the renewable carpet.

The New London Dock. THE Port of London Authority has received, through the Prime Minister, an intimation that the King has consented to cut the first sod of the new dock about to be constructed south of the Royal Albert Dock. It is stated that the estimated cost of the scheme for the building of the new dock is nearly 2,500,000*l.*, and the work will occupy some years. The length of the dock will be 4,600 ft., so that there will be a quay length of 9,200 ft. The width at the eastern end will be 700 ft. and at the western end 500 ft. There will be a depth of 38 ft. of water, and the area of water in the dock will be 65 acres. The land on which the new works are to be carried out was bought some ten years ago.

The Necessity for Standardisation. SIR JOHN MCCALL, Agent-General for Tasmania, presided at a recent meeting of the Institute of Sanitary Engineers, when the Presidential address was delivered by Mr. A. J. Martin, who has been re-elected President of the Institute. Mr. Martin said that the historian of the next generation would have to put on record how the greatest commercial nation in the world, fighting for dear life against a swarm of keen competitors, persisted in handicapping itself with an antiquated and cumbrous system of weights and measures totally different from that employed by the rest of the world, and containing such gems as that 30¼ square yards make one rod, pole, or perch. The most striking case probably of expense and inconvenience caused by the absence of a recognised standard had occurred in connexion with railway gauges. Undeterred by our experience, Ceylon, and Australia had committed selves to a policy of mixed gauges, and, or later, would have to rectify their m The employment of standards involv application of systematic tests, whic given rise to a new profession, that testing engineer. The rigorous test applied to all kinds of engineering materi led to a vast improvement in their reliability, and uniformity. The stand the qualification of the engineer had un a notable evolution. Local authoriti begun to take a more enlightened view duties, and the office of the District S to-day was far from being a sinecu regarded it as a reproach to British sense that men utterly devoid of engi qualifications should be free to undertak of the gravest import to the life and h the community. In the absence of a working standard of professional com local authorities requiring the services engineer not infrequently advertis competitive schemes. The weak point competition system was that it merely the scheme, while it afforded no criticism competence or honesty of the ma Association of Consulting Engineers, wh been recently formed, met a long-felt bringing together engineers who were petent in their respective lines. He that local authorities should be able to the offices of the Local Government B register of all engineers who had carr works of the kind they had in view specified time.

Engineering Features of the Royal Liver Building, Liverpool. BEFORE the Liverpool sity Engineering Socie A. E. Culley, A.M.I recently read a paper, "Some Engineering of the Royal Liver B Liverpool." By the a series of lantern slides Mr. Culley d the progress of the edifice, which is of re concrete construction throughout. explained that by using this material as 25 per cent. in the cost of the was saved. Dealing next with the wa Culley stated that these were made of the thickness of which varied from 3 in. and owing to the fact that the building the frame type the walls were able to be at several different floor levels simultan Finally, the internal arrangements wer with, such as the lift accommodation, the heating system, and the clock.

Standard Heads for Small Screws. THE standardisation screws and screw hea first considered by the neering Standards Committee on Screw and Limit Gauges, and finally by sub-committee appointed in July, 190 report now issued was prepared after ex evidence had been obtained from the chief facturers and users of small screws country, and contains recommendatio the dimensions of countersunk, instr round, cheese, and filister heads for Association screws of sizes 0 to 14 and saw cuts in the same. The report co with a sheet of illustrations and a standard proportions.

The British Fire Prevention Committee's Fire Tests. THE British Fire Pre Committee's testing tions last week compris tests on a series of openings glazed with "C lite" glazing, no pa glazing exceeding 4 ft. super., and twelve being under test for varying periods o minutes and ninety minutes, under the mittee's standards. There were furthe with two reinforced concrete doors m the Committee for experimental pu and submitted for the Committee's st two-and-a-half hours' high-temperatu test. Here, again, work that had never been under official examination was observation. In both cases the resu the tests will be published shortly.

THE BUILDING TRADE.

ANCHESTER BUILDING 'RADES EXHIBITION.

E seventh Manchester Building Trades Exhibition, organised by Mr. W. Cawood, was opened by the Lord of Manchester at the City Hall on y. The Exhibition is under the patron- the Manchester, Salford, and Building Trades Employers' Asso- Manchester and District Branch l Registration of Plumbers, the Insti- Plumbers, Ltd., and others. The Ex- includes a series of town-planning , which will be of special interest to chitects. Diagrams of the proposed ns of the Royal Exchange in the Bill Parliament, together with new ideas how that scheme could be improved also shown, as well as the long-dis- nlargement of the railway-station. following are some notes on the :

and No. 69 the Acme Patent Ladder y, of Summerley-street, Earlsfield, S.W., show extension ladders of all ions, and also their automatic folding n steps and automatic trap-door fire

ands Nos. 65 and 66 Messrs. W. R. & Co., Ltd., of Horwich, manu- s of porcelain-enamelled fireclay and ware—comprising baths, lavatories, closets, sinks, etc.—show their stone- oes, gullies, and fittings, etc.

and No. 74 the Gelatinous White y, Ltd., Harewood Wharf, Norwood Southall, show their gelatinous Filocol, which is a distemper for eilings and inside walls. It does not peel; it is sanitary, and gives a ng odour to the room where it is t can be had in powder or paste, and as a substitute for whitewash.

and No. 89 Messrs. Kirchner & Co., and 25, Tabernacle-street, London, hibit their woodworking machinery, g a heavy tenoning machine, with bottom scribing spindles, specially for builders and contractors; a rising table saw-bench, with moulder and slot mortiser, suitable riety of work; a heavy rising table h; patent overhand planing and machine, with tables 8 ft. long; avy panel planing and thicknessing ; universal sharpening machine: spindle moulding and recessing with top arm which can be swung of the way when not required; Ideal" band sawing machine, with utside ring oiling bearings; new e" type four-cutter planing and machine; combined over and under and various other machines.

ands Nos. 16 and 17 Messrs. C. H. hite & Son, Grand Surrey Canal, , London, S.E., show their " ceiling whitewash distemper in rm. The material has been intro- supersede the wasteful and objec- methods inseparable from home-made sh. The distemper will readily mix y dry colour, producing suitable n wall and frieze decoration at a cost.

ands Nos. 27 and 28 the Saxon Cement Company, Ltd., Cam- show examples of the raw material arry, of raw material after drying, d marl ready for burning, and also of raw material ready for kilns, of clinker from continuous and ilns, of clinker after preliminary and of finished Saxon cement.

and No. 44 Messrs. F. McNeill & b's-buildings, Bunhill-row, London, d also Manchester and Salford, show phalt roofing felt, sarking felt, us hair felt, inodorous felt, patent phalt damp-proof course, fibrous damp course, pure Trinidad bitumen urse, dry hair felt, fibrous plaster leeting, "Combinite" roofing, etc., and several other of the firm's well-known specialities.

At Stand No. 63 Messrs. C. Jennings & Co., timber merchants, joinery manufacturers, and general woodworkers, Pennywell-road, Bristol, show an example of their fretwork arches with balustrading above. Special attention is directed to the specimens of oak and ash plywood. Other exhibits include two windows, one illustrating the firm's P.T.O. fittings, and the other Miller's B.C. system. Doors are shown in a variety of designs, also balusters round turned, square cut, and fretsawn, and newels, and other examples of their manufactures. The firm's patent geyser is shown, and there will be demonstrations of its working at frequent intervals; and also mouldings, electric light casings, and picture rails in great variety, and Smokcure chimney-pots. Messrs. Jennings are exhibiting a four-fold brass-jointed souvenir rule and a new fully illustrated catalogue.

The Patent Rapid Scaffold Tie Company, Ltd., 124, Victoria-street, Westminster, S.W., have erected a scaffold at their stand (No. 60), showing the well-known Scaffixer scaffold lashings. Demonstrations are given at intervals showing the speed, strength, and efficiency of these lashings.

Messrs. W. B. Haigh & Co., Ltd., Globe Iron Works, Oldham, are exhibiting their patent combination chain and hollow chisel mortising machines, etc.

Messrs. Shaw & Carter, Ltd., 10, Edgbaston-street, Birmingham, are showing the following :—Patent cloakroom fittings for elementary and secondary schools, patent revolving boot-racks, "Shawcar" patent umbrella holders for schools, single and double rail hat and coat racks, hat and coat racks heated by hot water for schools, "Shawcar" patent ball-bearing mortise and rim locks, "Shawcar" patent ball-bearing axle pulleys, "Simpil" patent axle pulleys for use in sashes, doing away with cords, weights, and boxings, "Shawcar" self-closing door hinges, to act without springs, new and improved designs of bronze metal and brass lock furniture and door fittings, for public buildings, schools, private houses, etc.

An interesting feature of the stand of Messrs. G. Brady & Co., Engineers and Lift Makers, Pott-street, Ancoats, Manchester, is a new patented type of electric service lift, working, to raise loads up to 56 lb. The novelty of this lift is that steel tapes are used instead of wire or hemp rope. It can be operated either by push buttons or hand rope control, and is capable of making 1,000 journeys at a cost of 1d. for current consumption (at 2d. per unit). An electric cathead is also shown, suitable for builders, and is designed for handwork and rough usage. A patent hand-power service, or dinner lift, is shown complete and working, to raise a load of 56 lb. It is noiseless and self-sustaining, the brake acting automatically, so that the cage is sustained at any point immediately the hand rope is released. A hand-power goods' lift gear to raise a load of 10 cwt. is shown. This is also noiseless and self-sustaining, and of similar construction to the service lift, but fitted with spur gearing. A revolving shutter is also shown. These shutters are for car entrances; as they coil at the top they are out of the way, and are easily operated, being usually balanced on spring rollers. Large shutters are worked by gearing.

Messrs. Cakebread, Robey, & Co., of Caroba Works, Wood Green, London, N., are exhibiting at Stand No. 70 a selection of their specialities of drain and tube clearing machines. Among their patent locking joint devices for preventing rods being left in a drain or becoming disconnected in use is their "Ferret" lockfast joint, of which they have supplied his Majesty's Government with over 200,000 ft. during the last few years. This joint has also been largely exported. They also show the "Magnet" lockfast joint, which obtained a bronze medal at the Health Exhibition at Brighton, 1910, of the Royal Sanitary Institute. This joint is made of cast brass, and has no rivets or pins of any kind, and has no spring to get out of order. This firm also exhibits several patterns of smoke machines, and among these we notice the "Standard" smoke machine, which obtained a bronze medal at the exhibition at Belfast last year of the Royal Sanitary Institute. One of the features of this machine is its portability, as it only weighs 14 lb., and the size is only 12 in. by 7 in. by 9½ in. high. The features of the patent drain plug exhibited by the firm is its easy action, owing to a wheel carriage revolving between the thumb-screw and top plate. Among other goods exhibited are drain testing bags, suction pumps, clearing obstacle rods for pruning trees, etc., also Sutton's patent lead collars, which can be fixed to existing work without removing pipe from nozzle of water-closet basin. Another exhibit is Steven's patent barrel lock, which can be fixed with 1-in. centre bit in a few minutes. It is very strong and reliable, and there are no delicate working parts.

Messrs. Stothert & Pitt, Ltd., Engineers, London and Bath, show their "Smith" mixer on skids fitted with feeding hopper and stand and driven by an electric motor. This machine is used very largely for mixing both concrete and tar macadam. The mixer has a capacity of 6 cubic ft. mixed material per batch. The firm also show the "Victoria" concrete mixer, with special feeding arrangement, water tank, and driven by an electric motor; the whole plant is mounted on a truck with road wheels and swivelling fore-carriage. The capacity of this mixer is 6 cubic ft. per batch mixed material. "Smith Hand Concrete Mixer" is also mounted on wheels and complete with charging platform. The capacity of this mixer is 3 cubic ft. mixed material.

At Stand No. 56, Vulcanite, Ltd., of Westinghouse-road, Trafford Park, Manchester, and of Belfast, London, etc., show a model brick building with a flat roof laid out as a miniature roof garden, the roof being constructed of joists and 1-in. T and G boards covered with patent Vulcanite roofing. Messrs. Vulcanite, Ltd., who are the patentees of this roofing, have covered roofs measuring in the aggregate upwards of 4,000,000 super. yds., including hotels, villas, works, and public buildings in the United Kingdom, the colonies, America, and other countries, and they claim that their patent Vulcanite roofing is a perfect covering for flat roofs of wood or concrete construction, inasmuch as it is absolutely waterproof and fireproof, and is not affected by expansion and contraction, vibration, or settlement of the building. The exhibit also includes a water tank, which is formed of 9-in. brick walls, the bottom and sides being lined with Vulcanite, and afterwards bricked in with white glazed bricks. In order to demonstrate the waterproof qualities of the Vulcanite ordinary mortar only has been used and an opening has been left in the glazed brick lining leaving a portion of the Vulcanite exposed. Another feature of the exhibit is "Bituna" pure bitumen dampcourse. This material, which is being specified by nearly all the leading architects for foundations, subways, arches, etc., is guaranteed to be made of pure Trinidad bitumen with no admixture of coal-tar or coal-tar pitch. A section of a brick wall is shown standing in water with a course of "Bituna" about 6 in. above the water level. Underneath the dampcourse the bricks are soaking wet, whilst they are perfectly dry above. Messrs. Vulcanite, Ltd., are also exhibiting Vulcanite and Rexilite dampcourses for foundations, etc.; Leatherite, Vulcanite, asphalt, and Rexilite roofing for sloping and circular roofs; Vulcanite bitumen and Vulcanite waterproof sheetings for underlining slates, tiles, etc.; and a model building covered with Rexilite.

The specialities Messrs. D. Anderson & Sons, Ltd., are exhibiting are as follows :—Their "Rok" roofing has been recently put on the market, after exhaustive and successful trials in India and other countries where the

conditions are far more severe than in England. In South Africa the South African Union officials have passed it as meeting all their requirements of a roofing felt, and have given permission for its use in contracts to be executed for them. At home it has recently been used for roofing buildings for the Great Southern and Western Railway of Ireland, at Limerick, and many other buildings. The firm are also showing their Stoniflex felt, which is well-known as a capital felt for roofing buildings, and also for sarking and lining purposes. Another new article they are showing is their "Zerolite" insulating paper for insulating cold stores and lining purposes. They are also drawing the attention of architects and others to the bitumen sheeting, made from pure Trinidad bitumen, which they are supplying for reservoirs, tanks, etc., and their pure bitumen dampcourse for walls. Rolls of their bituminous hair felt, which is coming greatly into favour for sound deafening and sarking purposes, are on show. This article is an improvement on the ordinary hair felt for this purpose, as it is vermin proof. Fencing treated with Sideroleum wood preservative is shown. It is also used for half timber work, sheds, etc. It is both a preservative and gives a pleasing appearance, being of a nut-brown shade. The firm also show a range of galvanised sheets coated with their "Sideroslhen" anti-corrosive paints in various shades, which they commend to architects' attention as paint for galvanised iron.

The Interoven Stove Company, 78A, Great Queen-street, W.C., are showing their well-known stove. The "Interoven" may be used as a sitting-room grate, presenting exactly the normal appearance, while a simple movement converts it into an efficient cooking-range, equal in its cooking capacity to a 36-in. kitchener. The hot-plate provides room for four large saucepans, two of one gallon and two of three pint capacity. The high-pressure circulating boiler can be heated when the oven or the open fire is in use, ensuring a continual supply of hot water. It can be cleaned or removed without any part of the stove being unscrewed or unset. Hot-water tanks of up to thirty-five gallon capacity can be fitted. All flues are of iron, thus reducing cost of setting to a minimum. It can be fitted in any ordinary room, opening 14 in. deep if without boiler, or with boiler by cutting chase in wall for boiler flue 2 in. deep by 5 in. wide by 20 in. high. It is fitted with a blower, the hot-plate acting as this very useful addition to an open fire-grate. The oven and all working parts can be removed and replaced without the use of tools. The flues and chimney can be easily cleaned by lifting out oven.

The exhibit of the Art Metal Construction Company, Ltd., and Roneo, Ltd., includes steel doors, steel desks, and steel furniture. The manufacture of steel furniture, doors, partitions, desks, etc., was originally developed in the United States. The Roneo, Ltd., have been acting as selling agents for the eastern hemisphere for some time, but recently the Art Metal Construction Company, Ltd., has been formed, and a factory is now being erected at Silvertown for the purpose of turning out this work in England. The door exhibited was tested by the British Fire Prevention Committee on December 13 for a period of two hours. An official report is now being prepared. One has only to look at the door to be convinced of the manner in which it went through this severe test. In this exhibit are shown doors panelled in various styles, and though the architect's design can be followed, protection against fire is maintained. Steel counters, screens, and dividing partitions are shown, as well as the more complicated roll-top desks, vertical letter files, and cases with roller curtain. The exhibit includes library shelving and strong-room shelving. The finish of the steel work is excellent, and we understand that the material is made of a special grade of steel, free from scale and imperfections. It is treated to three coats of best stoved japan, with the result that it will not chip or scale, and will withstand any moist climate. A steel door exhibited is finished in grained mahogany, the graining being very well done.

The Val de Travers Asphalte Paving Company, Ltd., 92, Market-street, Manchester, are exhibiting the following models:—Tank lined with asphalt, asphalt covering to concrete roof, valley gutter lined with asphalt, stable, vertical plate work, covering of casemate, sewer and entry, powder magazine floor and vertical sides, sanitary manger, bridge covered with asphalt, asphalt underlay for parquet flooring, horizontal dampcourse, and bituminous concrete block to absorb vibration of machinery. They show samples of compressed asphalt cut up from various streets after many years' wear, natural rock asphalt as mined, powder, and slabs hydraulically compressed, and of various sizes and thicknesses. They also show rock asphalt mastic for paving, granited, and in two lays for roofs, etc. Val de Travers asphalt blocks are also shown, Pyrimont Seyssel asphalt blocks, "Matrix" in barrels and sample tins, acid resisting asphalt paving, Bridport grit, refined Trinidad bitumen, and refined Venezuelan bitumen.

The Beaver Company, of Ottawa, Canada, and Buffalo, New York, who have established themselves in the United Kingdom with the object of developing their substitute for lathe, plaster, and wallpaper, are exhibiting at Stand No. 73A. Beaver Board is a finished wall-board that takes the place of both lathe and plaster and makes the use of wallpaper unnecessary. It is made entirely of selected woods, reduced to fibrous form and pressed into panels of various sizes with a uniform thickness of a scant $\frac{3}{32}$ of an inch. It has a mat or pebbled surface, adapted to tinting or painting in any colour-scheme. It is very light, and yet tough and strong. In manufacture the wood fibres are crossed, ensuring the maximum resistance to sound, cold, or heat. The material is uninjured, it is claimed, by shocks, strains, and vibrations that often bring plastered ceilings down, and it will not crack, chip, or deteriorate with age.

MONTGOMERY'S BUILDING TRADES EXHIBITION.

THERE must be considerable activity in the building trades at Manchester, judging from the fact that not only is there the exhibition of building materials, etc., now being held in the City Hall, but that a Building Trades Exhibition, arranged by Mr. H. Greville Montgomery, is to be held at Rusholme from March 9 to March 23. The offices of the Exhibition are at 27, Brazenose-street, Manchester.

LONDON MASTER BUILDERS' ASSOCIATION.

THE fortieth annual general meeting of the London Master Builders' Association was held in the Council Chamber, Koh i-Noor House, Kingsway, W.C., on February 29. The President (Mr. G. Bird Godson) presided, and afterwards Mr. James S. Holliday (the newly-appointed President).

The following officers and members to fill up rota vacancies on the Executive Council were elected for the coming year:—

President: Mr. James S. Holliday (Messrs. Holliday & Greenwood, Ltd.).

Senior Vice-President: Mr. Walter Lawrence, jun. (Messrs. Walter Lawrence & Son).

Junior Vice-President: Mr. W. F. Wallis, J.P. (Messrs. G. E. Wallis & Sons, Ltd.).

Treasurer: Mr. Edmond J. Hill (Messrs. Higgs & Hill, Ltd.).

Council: Mr. C. E. Allen (Messrs. Allen & Co., Pimlico); Mr. F. J. Gayer (Messrs. E. A. Roome & Co.); Mr. R. J. Holliday (Messrs. Holliday & Greenwood, Ltd.); Mr. F. M. May (Messrs. Holland & Hannen & Cubitts, Ltd.); Mr. F. G. Minter; Mr. W. J. Renshaw; Mr. Howell J. Williams, J.P., L.C.C. (Messrs. H. J. Williams, Ltd.); Mr. Hy. Wall (Messrs. Chas. Wall, Ltd.); Mr. Walter Wood (Messrs. F. & F. J. Wood).

Honorary Auditor: Mr. E. S. Blake (Messrs. W. E. Blake, Ltd.).

A hearty vote of thanks was given to Mr. G. Bird Godson for the able and assiduous manner in which he had discharged the duties of President during the past year.

The Trade Disputes Act (1906) was considered, and the meeting desired unanimously to lodge a petition against the said Act in the House of Commons.

Instructions were given to secure the signatures of all the members of the Association, and they are earnestly requested to do so.

The fortieth annual Report was pres
and approved, and also the audited acc
From the annual Report we take
following:—

"During the past year there has be
improvement in the building trade, b
abnormally keen competition which pr
renders it difficult to carry on busine
anything like profitable lines.

The Institute of Builders formulated a
ments to Clauses 20 and 28 of the A
Contract, together with a new form of co
for sub-contractors. These proposals were
before this Association and were appr
Further steps in the matter are now
taken.

The National Insurance Bill has been
fully considered in co-operation with
bodies. The Council is glad to recognise
public attention is being drawn to the
abuse of the Trades Disputes Act (1906),
they are associating themselves with
bodies in pressing upon the Government
action to put an end to the abuses ex
under the Act. Careful attention has
given to several other Bills before, or
brought before, Parliament, and they
been referred to the Employers' Parliame
Council. The Council takes this opport
of thanking Mr. William Shepherd and
Benjamin I. Greenwood for their servic
the trade as members of the Executive
mittee of the Employers' Parliame
Council.

Mr. F. G. Rice was appointed represent
of this Association on the Home Office De
mental Committee appointed to co
matters relating to the dangers arising
the use of lead in painting, to collect evid
and to report thereon. The Committee
pointed has held many protracted meet
and the building trade is under great ob
tions to Mr. Rice for the interest, atte
and ability which he has devoted to
subject.

The labourers applied for the formul
of a Working Rule Agreement, but the Co
could not consent to the proposal. The Co
declined to consider an application fo
increase of wages to smiths and hammer
as there was no Working Rule Agree
between their societies and this Associa

PORTSMOUTH MASTER BUILDERS' ASSOCIATION

THE annual dinner of the Borough of P
mouth and District Master Builders'
Building Trades Association was held in
Mayor's Banqueting-room of the Town
recently. Councillor A. E. Porter (Presid
of the Association) in the chair, and t
supporting him included Messrs F. H
(Vice-President of the National Federation
Building Trades Employers), F. Woo
(Secretary of the Southern Counties Fed
tion), J. Harding (Vice-President of the P
mouth Association), F. B. Roskell (Secre
of the Portsmouth Association), etc.

After the loyal toasts had been
honoured, Mr. S. Salter submitted "
Mayor and Corporation," and Councillor E
Main responded. He said there was one di
tion in which, in his opinion, the Corpora
should not interfere with the builders,
that was in attempting to regulate their
tracts with their employees. Whatever
done in connexion with the Town Cou
contracts, he thought they had no right
interfere with builders' contracts with t
men. In the Corporation they endeavoure
so frame their contracts as to make them
all round, both for employer and emplo
But when it came to those outside the C
poration they had no right to interfere.
was the last person in the world to say
they should not pay the working classes
adequate wage, because it enabled the

in better houses, and in the long run ne was the better off; but he thought the ers could be well left to deal with mployees, without any interference from uncil.

cillor Ash proposed "The Portsmouth istrict Master Builders' and Building Association." Some people thought sociation existed merely to fight the but that was not so. Its object was to everything run smoothly, by inducing ster builders to "toe the line" and unison in dealing with their men.

President replied, and said the Asso- was not only forty years old, but its rship numbered eighty, which was very onsidering the circumstances of the They hoped, however, to augment that , and to induce all master builders in trict to join. Co-operation was in the he men were teaching them that, and only too evident that unless the masters ed they would have to go under. The tion was not formed to fight the men, order that by co-operating one with the and working in unison, they might things to go on the more smoothly. thout unity the employers would not be do anything, nor would they be able their aims carried out. The men's were endeavouring to get all the em- to join the unions. That was their im, and that was really the object in on the fair wages clause in the There could be no other reason for the existing clause for ensuring fair all Corporation contracts was quite nt for all honest builders. As an tion they were always ready to meet in remedying just grievances. Up to sent time they had got on very well e men, and had fought their battles a manner that both sides were satisfied. now many years since the Portsmouth had had any friction with their men, hough they had some trouble with the rs at the present time, he hoped it e settled amicably.

illor G. F. Smith submitted "The l Federation and Kindred Associa-

F. Higgs replied on behalf of the l Association, and spoke at some length advantages of organisation, not merely ing the combinations among the men, for dealing with the Government, with ouncils and other public bodies, who d to get the better of builders. Com- was also useful in preventing undue tion among the members of the trade. F. Woolley replied on behalf of the n Counties Federation.

Vosper, as President of the newly- Portsmouth Engineering and Allied Association, also replied. He dealt e fair wages clause, and asked why chandlers, tailors, and other trades not be compelled to hang up their wages as well as the building trades. ther toasts were "The President" id by Mr. Crockerell and acknowledged cillor Porter) and "The Visitors and tembers."

HNICAL SCHOOLS AND THE TRADES.

ineteenth annual general meeting of ciation of Technical Institutions was the 20th ult., at the Goldsmiths' Hall, ne, E.C. Sir George H. Kenrick (Bir-) was unanimously elected President Association for the ensuing year, and Presidential address on the subject, We Teach Trades-?" said the amount actually taught at the present time was all compared with the total instruction As soon as an occupation had been upon by a former scholar of an ele- school there was, and there ought demand for more information about than could be obtained in an ordinary factory. If they were doing their far from discouraging this demand, uld do all in their power to foster it. seless to expect discoveries in science plied to industries unless they had who would make it their business to hese discoveries and explain them to g people who were learning the trade. as there a time in which employers loyees were so completely syndicated were now. For the purpose of giving ning best suited to the trade, every uld form its own Education Com- d give it plenty of money and plenty tion. In these circumstances, he every local authority would do its forward the movement, and he could not but believe that the Board of Education would second those efforts with equal zeal.

Mr. W. M. Gardner, Principal of the Technical College, Bradford, maintained that it was impossible in these days for a lad to learn his trade properly in works. They were getting further away from such conditions by specialisation, and if the young man did not learn his trade at a technical school, he never learned it at all; he became a mere machine, knowing only a portion of the work.

WATER BOARD CHARGES.

At Westminster County Court on the 21st ult., the Metropolitan Water Board claimed 11*l.* 15s. 3d. water rate against Messrs. Evans, Wadham, & Co., Gray's Inn-square. The claim was based upon sect. 8 of the Board's Charges Act. The defendants had offices occupying two floors, and used the Board's water on both, although the only supply was a draw tap on one floor. The Board claimed the rate based upon the rateable value for both floors.

Mr. Norman Barraclough, of the defendant firm, urged that there was no supply to the floor now sued for, and that he was entitled to draw a glass of water on the floor where the tap was and take it to another part of the premises to drink without being liable to pay water rate for the place where he drank it as well as for the part of the premises where the tap was.

In a second case Messrs. Russell, Woollven, & Co., of Clifton-street, E.C., were sued for 5*l.* 8s., and Mr. F. T. Villiers Bayly, Counsel for the defendants, raised a similar question as to the premises being separate tenements.

Judge Woodfall said he had not to consider whether there was any hardship, and he must find for the Board in both cases with costs.

LIVERPOOL MASTER BUILDERS' ASSOCIATION.

The annual dinner of the Liverpool Master Builders' Association was held on the 27th ult. at the Hotel St. George. The President, Mr. Thomas M'Hugh, presided, and among others present were Messrs. James Storrs (Chairman of the National Board of Conciliation for the Building Trades), Thomas Woolfenden, Arnold Thornley, W. P. Horsburgh, Joseph Parry, J. T. Alexander, and T. R. Hutchins, and Professor Reilly. Proposing the "National Federation of Building Trade Employers," Mr. R. A. Costain said serious disputes in the building trade had been very exceptional. During the past few years a strike had been practically unknown, and they were quite safe in saying that that was due to the organisation of the employers on the one hand and the men on the other. That day a question had been asked in Parliament as to the wages paid by a certain Liverpool firm carrying out Government work. If that firm had been a member of the Liverpool Master Builders' Association it would not have been necessary to ask a question in Parliament. An inquiry at the office of the Association would have elicited all the information required. They paid satisfactory wages and attracted competent artisans to their service, and, if in nothing else, in that fact their existence was abundantly justified. The toast was responded to by Mr. Storrs and Mr. Woolfenden (President of the Lancashire and Cheshire Federation).

GENERAL BUILDING NEWS.

ENLARGEMENT OF CHAPEL ACCOMMODATION, EXETER DIOCESAN TRAINING COLLEGE.

Following the enlargement of the administrative and teaching accommodation of the college buildings, the enlargement of the chapel has been for some time under the anxious consideration of the authorities. Originally intended for accommodating sixty students, this has now been practically doubled. Owing to the restricted space available for the enlargement of the building, it was only possible to carry it in an eastward direction. Two new bays have been added, and at the west end an organ loft has been constructed, to receive the organ, which originally stood at the ground level and blocked the entrance in the sacred edifice. The seating arrangements originally faced south and north, according to a general arrangement in collegiate chapels. This has now been altered and the whole of the seats face eastward. Provision has been made at the west end for stalls for the clergy, staff, and tutors, and behind the same, under the organ loft, are two enclosures for visitors. The building has been carried out in South Devon lime stone, picked on the face, with dressed quoins of the same material, and the angles and buttresses, box ground stone being used for the windows and the dressings. The interior fittings are of oak throughout, and the floor of the nave portion, wood-blocks, laid level throughout. The sacrarium portion is laid with polished slabs of black and white marble, laid diagonally. The contract for the work has been carried out by Messrs. George Setter & Son, the amount of their contract being 816*l.* 16s.; the electric lighting by Messrs. Hubber & Son; the heating on the low-pressure system by Messrs. Wippell Brothers & Row; the stained glass and glazing generally by Messrs. Drake, of the Cathedral-yard; and Messrs. Hele & Co. reconstructed the organ in the new loft. The architect for the extension of the college buildings, and also for the chapel enlargement, is Mr. James Jerman. F.R.I.B.A., Official Architect to the Exeter Diocesan Board of Education, and the clerk of the works has been Mr. E. H. Palmer.

NEW BUILDINGS IN LONDON.

Proposed enlargement of Isolation Hospital, Barnet, N. (3,000*l.*); Secretary, Isolation Hospital, Barnet. Alterations to St. James's Infirmary, Wandsworth, S.W. (570*l.*); Messrs. Dewsett & Jenkins, builders, Sunny Hill-road, Wandsworth, S.W. School, Vicarage-lane, East Ham, E. (7,280*l.*); Mr. J. W. Jerram, builder, Crown Works, Boundary-road, East Ham, E. Buildings, Southampton-buildings, Holborn, W.C.; Messrs. Holliday & Greenwood, Ltd., builders, Brixton, S.W. Buildings for Messrs. Burberry's (outfitters, etc.), Haymarket, W.; Messrs. Prestige & Co., builders, 119, Grosvenor-road, S.W. Extensions of premises for the Civil Service Co-operative Society, 25, Haymarket, W. Extensions of offices of Norwich Union Insurance Company, 51 and 52, Fleet-street, E.C. Rebuilding shops and offices, etc., Gresham-street, E.C.; Messrs. W. Cubitt & Co., builders, 258, Gray's Inn-road, W.C. Rebuilding shops, showrooms, etc., St. Paul's-churchyard, E.C.; Mr. C. F. Yearsley, builder, 4, Great Marlborough-street. W. Post-office, East Ham, E.; Messrs. Chessum & Sons, builders, 7a, South-place, E.C. Offices, Westminster, S.W.; Mr. J. H. Clarke, architect, 102, Bishopsgate-street, E.C. Hay's Wharf and dock premises, Thames-street, E.C.; Mr. W. Matts, architect, Birkbeck Bank-chambers, Holborn, E.C. Mineral water factory at Schweppes, Ltd., Vauxhall, S.W.; Mr. A. F. Briggs, architect, 9, Queen Victoria-street, E.C. Additions to Cowper-street Schools and Institute, E.C.; Mr. H. C. Clarke, architect, 102, Bishopsgate-street, E.C. Proposed additions to mental hospital, Croydon (35,000*l.*); Mr. G. F. Carter, Engineer, Town Hall, Croydon.

NEW PUBLIC HALL, EARL'S COLNE.

This hall is being erected at a cost of about 2,215*l.* from the designs of Mr. P. M. Beaumont, A.M.Inst.C.E., of Maldon. The building will be erected of red bricks, and includes a large main hall, 55 ft. by 33 ft. The contractors for the work are Messrs. Pudney & Son, of Colne Engaine.

TRADE NEWS.

The Workhouse Infirmary, Newton Abbot, is being supplied with Shorland's double-fronted patent Manchester stoves with descending smoke flues and patent Manchester grates, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.—The New Hospital, Devizes, is being supplied with the firm's warm-air ventilating patent Manchester grates.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been applied to Penrhos New School, Ystradgynlais.

The Beaver Company of Ottawa, Canada, and Buffalo, New York, have recently established themselves in the United Kingdom with an object of developing their substitute for lathe, plaster, and wallpaper. Beaver Board is made entirely of selected woods, pressed up into sheets of various width and lengths. It lends itself to decorative schemes, is guaranteed not to crack or warp, and will stand a strain of 500 lb. pressure on a 16-in. span. With Beaver Board cracked ceilings and warping walls are, it is claimed, entirely obviated. An additional recommendation is the fact that Beaver Board improves with age, and, as years go on, the panels become harder and harder, outlasting all other wall and ceiling preparations. Skilled labour is not absolutely necessary for the fitting-up of the material, and it can be put up without dirt, litter, or inconvenience. Particulars can be had from Messrs. H. W. Peabody & Co. (Beaver Board Department, Mr. R. A. Wilson, manager), 16, Eastcheap, E.C.

Owing to the expiration of lease of their premises at 4 and 5, East Harding-street, Fetter-lane, E.C., Messrs. Sprague & Co., Ltd., lithographers, have removed to Nos. 69 and 70, Dean-street, Soho, W.

SALE OF BUILDERS' STOCK, PLANT, ETC.

Messrs. J. T. Skelding & Holland inform us that they are holding a six days' sale at "The Maltings," Fishpool-street, St. Albans, commencing on Tuesday, March 12, of builders' and contractors' stock, plant, and machinery. Among the articles to be put up are two portable engines, four mortar mills, a well-seasoned stock of timber, steel joists, stanchions, etc., scaffold materials, carts, barrows, harness, etc. This sale is in connexion with the dissolution of partnership—*re* Messrs. C. Miskin & Sons—Miskin *v.* Carter.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Clapham.—Erection of buildings next to the western side of Park-hill, the southern side of Abbeville-road, and the eastern side of Briarwood-road, Clapham (Messrs. H. F. Buchan & Co.).—Consent.

Finsbury, Central.—Erection of one-story shops in front of Nos. 20, 21, and 22, White Conduit-street, Islington (Messrs. Watson & Thorp for Mr. P. Bendell).—Consent.

Fulham.—Projecting steps at the side of a building on the eastern side of Wandsworth Bridge-road, Fulham, next to Broughton-road approach (Mr. W. L. Griffiths).—Refused.

Islington, South.—One-story addition at the rear of No. 62, Barnsbury-street, Islington, abutting upon the eastern side of Thornhill-road (Messrs. Lovegrove & Papworth for the "Win-it" Motor Works).—Refused.

Islington, East.—Erection of a building on the northern side of Essex-road, Islington (Mr. T. W. Smith for Messrs. W. Danemann and F. C. Hine).—Consent.

St. George, Hanover-square.—Addition to the existing oriel window at No. 7, Balfour-place, next to Mount-street, St. George, Hanover-square (Messrs. Balfour & Turner for Major E. H. Brassey).—Consent.

St. Pancras, South.—Wood and glass porch in front of No. 52, Liverpool-street, King's-cross (Messrs. D. J. Chattell & Sons for Hertford Hotels, Ltd.).—Refused.

Strand.—Projecting sign in front of No. 405, Strand (The Brilliant Sign Company, Ltd.).—Consent.

Strand.—Wood and glass showcases at the Spaten Restaurant, Piccadilly-circus and Shaftesbury-avenue (Mr. C. Masey for Mrs. R. Freeman).—Consent.

Wandsworth.—Porches and wooden bay-windows to houses on both sides of a new road leading out of the south-eastern side of Upper Tooting-road and a house on the north-western side of Ravenfield-road, Tooting (Messrs. Swain & Selley).—Consent.

Width of Way.

Holborn.—Erection of a building on the southern side of Alfred-mews, Tottenham Court-road (Mr. G. Vernon for Minerva, Ltd.). Consent.

Holborn.—Extension of covered way over entrance to Robin Hood-yard, Holborn, from Leather-lane (Mr. J. Sawyer for Mr. A. W. Gamage, Ltd.).—Consent.

Islington, North.†—Addition at the rear of Nos. 490 and 492, Holloway-road, Islington (Mr. C. T. Lee for the London County and Westminster Bank, Ltd.).—Refused.

Lewisham.—Open shed at the rear of buildings on the northern side of Houston-road, Forest-hill (Messrs. J. Carter & Co.).—Consent.

St. George.—Erection of an addition to Meeting House-buildings, Meeting House-alley, Stepney (Mr. C. R. Price for Messrs. E. B. Dive & Co.).—Consent.

Lines of Frontage and Space at Rear.

Wandsworth.—Erection of buildings on the south-western side of Mitcham-road, Tooting, between the "Horse and Groom" public-house and No. 20 (Mr. E. R. Weaver for Messrs. Browning & Hiller).—Consent.

Width of Way and Height of Building.

Holborn.—Erection of buildings abutting upon Brooke street, Fox-court, and Holborn-buildings, London (Mr. F. Schooling for the Prudential Assurance Company, Ltd.).—Consent.

Lines of Frontage and Construction.

Battersea.—Temporary coffee-stall in front of No. 75, Falcon-road, Battersea (Mr. E. S. Walker).—Consent.

Clapham.—Showcase erected in front of No. 110, Clapham Park-road, Wandsworth (Mr. A. E. Peacock).—Refused.

Hackney, Central.—Showcases of a temporary character in front of No. 90A, Southgate-road, Hackney (Mr. W. J. Mason).—Consent.

Hampstead.—Wood and iron shed and greenhouse at No. 6, Briardale-gardens, Hampstead, abutting upon Clorane-gardens (Mr. R. B. B. Wimbush).—Consent.

Wandsworth.†—Temporary motor-house at the rear of No. 163, Mitcham-lane, Streatham, next to the south-western side of Fernthorpe-road (Messrs. J. H. Jenkin & Co. for Dr. Constable).—Consent.

Wandsworth.—Wood and iron motor shed at "Laurel Bank," Upper Tooting Park (Messrs. Jones Brothers for Mr. L. H. Nott).—Refused.

Width of Way, Lines of Frontage, and Construction.

Lewisham.—Wooden shop in front of No. 72, Ladywell-road, Lewisham (Mr. J. Nicholson).—Consent.

Wandsworth.—Retention of a water-closet and coal store at Roehampton House, on the eastern side of Roehampton-lane, Putney (Mr. W. J. Parker for Mr. A. M. Grenfell).—Consent.

Wandsworth.—Tool shed of a temporary character at Roehampton House, on the eastern side or Roehampton-lane, Putney (Mr. W. J. Parker for Mr. A. M. Grenfell).—Consent.

Lines of Frontage, Deviation from Certified Plans and Projections.

Marylebone, West.—Addition to the Florence Nightingale Hospital for Gentlewomen, Lissongrove. St. Marylebone (Mr. C. W. Ferrier for the Trustees of the Florence Nightingale Hospital for Gentlewomen).—Consent.

Space at Rear.

Deptford.—Erection of buildings upon land known as the "Show Yard," Deptford High-street (Mr. C. Cain).—Consent.

Kennington.—Erection of a building upon the site of Nos. 79, 80, and 81, Albert-embankment, Vauxhall, with an irregular open space at the rear (Messrs. Goodwyn & Sons for Messrs. Harvey & Thompson, Ltd.).—Consent.

Separation and Alteration of Buildings.

Paddington, South.—One-story shop at No. 40, Queen's-road, Bayswater (Messrs. Veale & Gibbs).—Consent.

Formation of Streets.

Brixton.—Formation or laying-out of a street for carriage traffic to lead out of the southern side of Acre-lane, Brixton (Mr. H. B. Michell). Refused.

Wandsworth.—Formation or laying-out of a new street for carriage traffic to lead from Nightingale-lane to Temperley-road, Balham (Messrs. E. Evans & Sons for Mr. E. Evans).—Consent.

Wandsworth.—Formation or laying-out of three streets for carriage traffic upon a site on the eastern side of Valley-road, Streatham (Mr. E. B. P'Anson for the South London and Streatham Estates, Ltd.).—Refused.

Cubical Extent.

Hammersmith.—Additional cubical extent in respect of a proposed bakery addition at the premises of Messrs. J. Lyons & Co., Ltd., Cadby Hall, Kensington (Messrs. Holman & Goodrham).—Consent.

Woolwich.—Erection of a building exceeding 250,000 cubic ft. in extent to abut upon the eastern side of Harden's-manorway and the northern side of Westfield-street, Woolwich (Messrs. Siemens Brothers & Co., Ltd.).—Consent.

Woolwich.—Erection of a building upon a site abutting upon the southern side of Greenlane and the western side of Henley-road, Woolwich (Mr. B. Dawson).—Consent.

Uniting of Buildings.

City of London.—Opening at the first-floor level between No. 17, Bread-street-hill and No. 202, Upper Thames-street, City (Mr. G. H. Greatbach).—Consent.

City of London.—Doors of fire-resisting hardwood and glazing in lieu of iron doors to certain openings in the division wall of a proposed building on the site of Nos. 8-11, Paternoster-row, City (Mr. R. Angell).—Refused.

Finsbury, East.—Uniting of Nos. 6 and 7, Charterhouse-buildings, Goswell-road, Finsbury (Mr. P. B. Tubbs for Mr. H. T. Tubbs).—Consent.

Westminster.—Opening at the first-floor between Nos. 7 and 8, St. Matthew's-s Westminster (Mr. F. Whittlesea for Governors of the Greycoat Hospital).—Co

SPITAL COMPETITIONS.

ur leading article this week we refer e remarks which appear in the issue ch 2 of our contemporary the *Hospital* rence to competitions for hospitals, and lly as to the recent competition for the Sussex Hospital, Hastings. We con- the matter of sufficient importance to at length from our contemporary.

e have often urged," says the *Hospital*, in this country there is at present no te system for securing the selection by ition of the best plans submitted, much providing hospital committees with a tee that the new hospital when erected thoroughly up-to-date, modern, and complete in every department. One practical reform which the architectural profession should insist upon, so far as the Royal Institute of British Architects is concerned, is the selection of a panel of experienced architects, competent on their merits to act as assessors. Another is that the selection should never be left to the decision of one assessor, whoever he may be, for the reason that a modern hospital is many-sided and that no architect by himself has the knowledge to enable him to judge which out of many plans, so far as the administration and requirements of a modern hospital are concerned, is in fact the best. An architect may, if he is conscientious, knowledgeable, experienced, and thorough, rightly be called upon to decide most points concerned with buildings, as such, which appertain to the professional work of an architect. For all the rest it is essential that there shall be associated with him a competent hospital expert who is admittedly an authority on the many technical and administrative matters which must materially affect a just and satisfactory decision as to the respective merits of a number of plans for a new hospital submitted in competition.

The causes of failure which have been apparent in the selection of plans in more than one recent competition in this country are every one of them due to absence of thoroughness on the part of the assessor, or to a want of thoroughness or of knowledge, or of practical hospital experience, or of a judicial mind to enable him first thoroughly to master and appraise all the conditions of competition and to disqualify every plan which does not comply with them. When a Committee instructs the assessor to draw his conditions to include a hospital of a given number of beds not to exceed the maximum sum, such assessor is bound by his instructions, and should disqualify all competitors who submit plans the estimated cost of which exceeds the amount fixed for the guidance of every competitor.

This question is a very grave one, and its gravity increases with every competition. . . . .

By way of illustration we publish this week criticisms on the awards in the most recent competition, in which no fewer than fifty-two sets of plans were submitted for adjudication and selection. As the immediate question affects primarily architects as a body, we have asked a Fellow of the Royal Institute of British Architects of great experience and position to study the whole of the plans submitted, to compare them with the plans selected, and to give our readers the benefit of the results he has arrived at. This special Report is the first of the two articles which follow. The second communication has been sent to us spontaneously by another Fellow of the Royal Institute of British Architects, who has had considerable practical experience in hospital construction and hospital competitions of all kinds."

In the course of the special Report on the East Sussex Hospital, Hastings, the writer says :—

"The site on which the new buildings are to be erected is about 4 acres in extent, and, while an excellent one in point of position and aspect, is a peculiarly difficult one to deal with on account of the levels. In shape it is roughly triangular, and along the whole of its south boundary abuts upon a public road. The general surface of the ground abutting on the road varies from about 7 ft. at the east end to 20 ft. at the west end above the level of the footpath, and the site itself has a fall of about 60 ft. from west to east, and from north to south is approximately level. Crossing the site about midway in its

length is a bank with a fall of about 7 ft. The subsoil is sandstone rock. It will be seen, therefore, that the main difficulty lies in the treatment of the levels, both of buildings and approach roads, and, on economical grounds, the avoidance of excavation in the rock as much as possible. When it is further taken into consideration that the Committee fixed the sum of 35,000*l.* (roughly 350*l.* per bed) as the total cost of an up-to-date hospital, the thought naturally occurs to us that neither the Committee nor the assessor realised at all the difficulties which competitors were asked to solve. The amount fixed as a maximum is inadequate enough if the site had been a dead level, but it is hopelessly insufficient for a building on such a site as this.

The hospital is to be for 102 beds, with provision for future extension. No information, however, is given as to the size of this future extension; in fact, in answer to a question put by a competitor, the assessor says, "Design only for specified buildings, with room for future extension." A more inept reply could hardly have been made. It should have been quite possible to decide upon some figure for the ultimate number of beds on the site, and clear directions ought to have been given on this point. . . .

The limit of cubic space (the far more important question of floor area is not mentioned) is fixed at 1,400 for all wards except those for children, which is fixed at 1,000 ft. The schedule of instructions is a long one, and while in some instances it goes into minute details, in others it is drawn so carelessly as to give rise to an inordinately long list of questions by competitors in order to elucidate the meaning. Points which ought to have been settled definitely have been left open, while others on which competitors should have been allowed a free hand are rigidly fixed. For example, information is sought as to the numbers respectively of sisters, nurses, and probationers, the requirements including separate sitting-rooms for each of these classes. The only information vouchsafed is that there would be about seven sisters, and that a common room for nurses and probationers would be accepted. Surely it should not be beyond the power of the authorities to say exactly how many sisters would be required!

A curious requirement in the schedule is for "patients' boxrooms," and on a competitor asking for what purpose these are required the answer is given, "Lumber-rooms, etc."! The question is asked whether the nurses' water closet in the ward block may be in the sanitary tower, and the answer is, "Not desirable." Why not desirable in the name of common sense? Appended to the schedule is a list of recommendations by the Committee, most of which would have been better omitted altogether. The impression left in our mind after reading the schedule and the questions by competitors, with the assessor's replies, is that the whole scheme has been carelessly drawn up and shows in many instances a lamentable lack of knowledge on the part of their adviser.

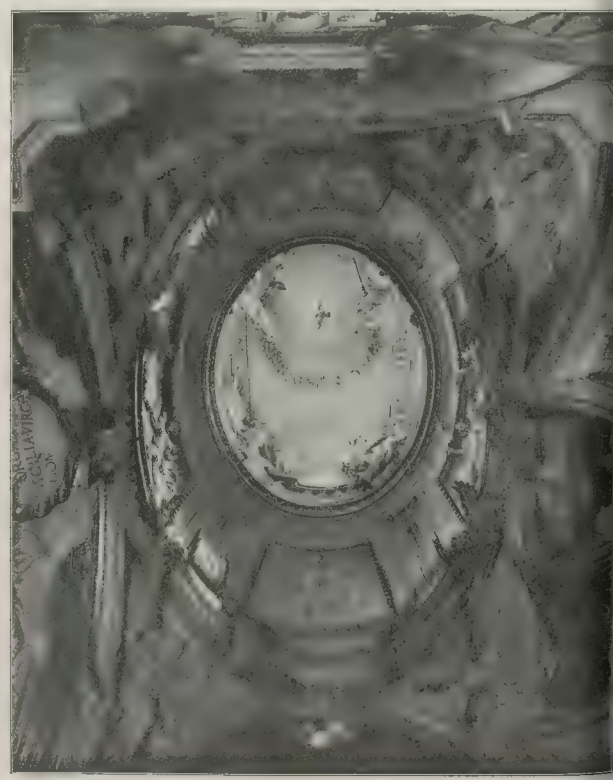
When we come to examine the plans we are at a complete loss to understand how any assessor with any knowledge of hospital planning could have arrived at such a decision as has been given in this case. Of the three premiated plans, Nos. 1 and 2 ought not to have been placed in the first half-dozen, and No. 3 is superior to the other two in almost every point. The designs as a whole are, it must be confessed, disappointing; comparatively few of the competitors have made any attempt to construct their roads economically, and many have been led into the error of multiplying entrances to get over the difficulties of gradients.

In the design placed first the road leading to the mortuary has a slope of 1 in 3 as calculated from the figured levels, although the elevation shows a nearly level approach. The road to the out-patient department has a slope of 1 in 4·7, and that to the main administration block a slope of 1 in 5. Needless to say that such gradients are wholly impossible for wheeled traffic and quite steep for foot traffic. These points alone ought to have disqualified the design.

Turning to the plans, we find the out-patient department and the dispensary placed at a level 16 ft. below the ward corridor, the only connexion between the two being by two long flights of stairs within a covered way. All medicines, etc., therefore, served from the dispensary for the wards would have to be carried up these stairs, as there is no lift and no possibility of arranging one.

The ward pavilions are so planned that when the future extension is carried out the eye wards and two of the two-bed wards must be destroyed. The eye wards, instead of being grouped together with a common operation-room, are placed one with the male, the other with the female wards, and two operation-theatres are provided. On the ground floor no sanitary provision is made for the eye wards and the two small wards, the only offices being at the extreme end of the large wards. The same remark applies to the first floor, where are wards for four and two patients with no sanitary accommodation, except that at the south end of large ward. Influenced, we presume, by the absurd answer to the question as to the position of nurses' water-closet, the author has arranged these offices off the main corridor—about the most inappropriate position he could have chosen.

In many respects the design placed second is superior to that placed first, but here again the difficulty of levels is not dealt with in a satisfactory way. The design placed third is, as we have said, distinctly superior to the other two. The planning of the roads is carefully worked out with due regard to the levels of the site. In point of general planning the design shows much greater knowledge of the subject than either Nos. 1 or 2.



The out-patient department is not well arranged, the author having apparently thought more of getting a good hall for concerts and large meetings than of the convenient working of the department. This is perhaps the weakest part of the plan, which is on the whole a good one.'

In the second contribution to our con
porary, the writer says :—

"The competition for the East Su
Hospital has proved to be a difficult prob

Baroque Architecture and Sculpture in Italy. By Corrado Ricci. (William Heinemann. 4to. 25s.)

A quality of imagination is especially necessary in estimating the real artistic value and scope of the work of this period, whether it be shown in symmetrical drawings to measurement or in picturesque photographs such as this volume contains.

Where it needs the stereoscopic camera to reproduce at all faithfully romantic effect of the receding columns, the receding planes, and the mingled perspective of terrace upon terrace and chiaroscuro of intricate forms which the architectural fancy of the ingenious Jesuit artists of the late XVIIth and early XVIIIth century produced. Perhaps the art of Mr. Alinari in his portrayal of the examples of this period is the best record to which we can turn, and many of us who have seen the palaces of Baroque Italy, with which he has been so largely occupied recently, have further stimulated to a study of much that we have been schooled to ignore or dislike. Much in the same way that we discover unsuspected beauties in such a period as the Victorian, for example, we are beginning to enjoy the methods of what we call the afterglow of the Renaissance. Bernini now ranks with the immortals, and, in manner, the expression of the temperament of his period in other mediums than ours has now come within our range of understanding.

We can imagine the exclamation of the architect at the above statement, but the remains that the student of a generation ago would have been advised to abstain as from poison from a study of many of the best examples contained in this volume. Genoa, with its streets of palaces that might line Pall Mall itself and yet be habitable, has now become as well known and appreciated as Florence in her earlier period, and we are certainly the gainers. The plasticity of the forms employed in the Baroque has shown us that practically any internal arrangement which has the quality of orderliness can be treated externally as a work of art in the traditions of the classic manner, and not the least important lesson which we have digested from our wanderings in these lands neglected of our fathers is the one that mouldings and details have their relation to the building they adorn as much as to the classic sources from which they are derived. Perhaps in no other period, except in the later French Gothic, have they been so intelligently and consciously employed.

The dangers of an unintelligent adaptation of this manner are too apparent for discussion, but we may mention that many a façade seen in sharp perspective in, say, one of the narrow streets of old Venice would come as a surprise when seen in full elevation, and we might easily regret with all the contempt of the complacent purist a motive that its real purpose was an inspiration. For those, however, to whom it is necessary to explain everything we do not commend this volume; the plagiarist will find it entirely after his own heart, but he will be left further removed from the principles of true design than ever, and, however much we may deplore the alterations which may result, we must at the same time remember that no influence so powerful as that exercised by the Baroque can work entirely from good. Great powers are to be wielded only successfully by corresponding individualities.

The Old Houses of Shrewsbury: Their History and Associations. By H. E. Forrest. (Shrewsbury: Wilding & Son, Ltd. 1s. net.)

This little work is not an ordinary local guide to a town, though the author admits that it is issued with the hope of adding to the attractions of Shrewsbury; it is, though a small book of under one hundred pages, the kind of work which should induce the townsfolk to take a loving and intelligent interest in the houses in their midst, that being another, and a very worthy one, of the author's hopes. An endeavour has been made to give a succinct account of the interesting old buildings of Shrewsbury, "partly by collating all available data regarding them and partly by careful study and comparison of the structures themselves." It is a useful little work, containing some excellent photographic reproductions.

Our Homeland Churches, and How To Study Them. By Sidney Heath. With Illustrations from Drawings by J. R. Leathart and others, and from photographs. (London: The Homeland Association, Ltd., Chandos-chambers, 15, Bedford-street, Strand, W.C. Size 5½ in. by 4¼ in. Cloth, 2s. 6d. net.)

This book was originally issued as one of the Homeland Handbooks, and has been out of print for some time. In preparing a new edition opportunity has been taken to remodel, to considerably extend, and to reillustrate the volume, while it has been thought desirable to transfer it to the handier form of the Homeland Pocket Books. A new feature is a series of architectural details by Mr. J. R. Leathart, and the glossary has been expanded to three times its original length. The work is a clear and simple introduction to the study of the churches of the homeland on their architectural side, and the author traces the history and development of English church architecture in a useful way. He has produced a handy little volume, which should do much to promote an intelligent and growing interest in our churches.

The Year's Art, 1912. Compiled by A. C. R. Carter. (London: Hutchinson & Co., Paternoster-row. 5s. net.)

The present edition of "The Year's Art" is the thirty-third annual issue of a very

Caprarola, near Rome, Palazzo Farnese. Stairway of XVIIth Century.
(From Dr. Ricci's "Baroque Architecture and Sculpture in Italy." Heinemann.)

useful work, which is described as "a concise epitome of all matters relating to the arts of painting, sculpture, engraving, and architecture, and to schools of design, which have occurred during the year 1911, together with information respecting the events of the year." The art events of the year are chronicled, and the information is easily found. The work contains several full-page illustrations.

The Antiquary. Volume XLVII. (London: Elliot Stock, Paternoster-row, E.C. Price 7s. 6d.)

THIS is the volume from January to December, 1911, of a valued magazine devoted to the study of the past. Each monthly issue of our contemporary contains a number of interesting notes and also articles and illustrations of an archæological and historical character, while articles on old castles, churches, etc., not infrequently occur in its pages. The volume is bound in an attractive manner, and we are glad to call attention to the forty-seventh volume of an admirable magazine.

Kœmmerer's Practical and Theoretical Letter-Book. Edited by ARTHUR SEYMOUR JENNINGS. With 140 plates and text. (London: The Trade Papers and Publishing Company, Ltd., 365, Birkbeck Bank-chambers, High Holborn, W.C. Price 30s. complete.)

IN this work the experienced craftsman will find much of a useful and suggestive nature, while for the student there are many helpful hints as to spacing and construction of letters, both in the text and plates. The book is also published in sections at 4s. 6d. each, which is a great convenience for those who would find no use for the foreign alphabets included in the complete edition.

Country Life. Volume XXX. (London: 20, Tavistock-street, Covent Garden, W.C.)

THIS is the volume of our contemporary for July to December, 1911, and a glance at its contents shows it to be an attractive volume. It contains many readable articles and a large number of admirable illustrations, including a good many architectural and decorative as well as nature subjects. The work is excellently printed, and makes an interesting volume.

Copyright Law and the Copyright Act, 1911. By HENRY HURRELL. (Waterlow & Sons. 3s. 6d.)

THE new Copyright Act comes into force on July 1, and architecture is included. Those who build would do well to study the clauses with which they are specially concerned, and the opportunity is given in Mr. Hurrell's book, which, besides the Act, observations upon copyright generally, a table of cases and a translation of the revised Convention of Berne, 1908, contains a treatise on French Copyright Law, by M. Maurice Théry. Many different opinions have been expressed on the desirability of creating copyright in architecture. Sir R. S. Lorimer, Mr. Ernest Newton, Mr. Voysey, Mr. Horder, Mr. Kitson, Mr. Quennell are among those who have decided against the benefit to be obtained from copyright. But the Royal Institute of British Architects gave official support to the scheme, and the result will be watched closely. If in practice plagiarism can be checked without retarding architectural evolution the new provisions of the Act will prove the wisdom of the promoters of the new legislation.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White, Chairman, presiding.

LOANS.—Loans are to be made to borough councils as follows:—Chelsea, 5,300*l.* for paving works; St. Pancras, 3,355*l.* for a housing scheme; Shoreditch, 3,480*l.* for re-paving works; and Stepney, 10,250*l.* for electricity mains.

NEW SCHOOLS.—In a report of the Education Committee it was stated that it is proposed to erect new schools as follows:—Clapham-common, for 800 children; Nine Elms, for 1,000 children; Clapham Junction, for 1,300 children; Battersea Park, for 1,500 children; Norwood, Acre-lane, for 1,000 children; Greenwich, for 500 children; Sydenham, for 500 children; Marylebone, for 500 children; Paddington, for 400 children; Bayswater, for 500 children; Balham, for 1,000 children; and St. Ann's-hill, Wandsworth, for 1,000 children.

It is also proposed to erect a new Roman Catholic school at Limehouse to provide accommodation for forty mentally defective and forty physically defective children.

THEATRES, ETC.—The following drawings have been approved by the Theatres and Music Halls Committee:—Imperial Hotel, Russell-square—electric lighting and heating arrangements in extension; 396, Mile End-road—arrangement of a portion of the entrance vestibule as a waiting space; Queen's Hall, High-street, Peckham—erection of an electrically illuminated outside sign; Wesleyan Methodist Hall, Westminster—installation of a switchboard in connexion with the secondary system of the lighting.

LEGAL COLUMN.

Workmen's Compensation.

The Court of Appeal in the case of Godwin *v.* The Lords Commissioners of the Admiralty have had to consider a question under the Workmen's Compensation Acts of some complexity. A bricklayer employed in the Portsmouth Dockyard sustained an injury to his hand, which subsequently necessitated the amputation of a finger. It appeared that under the Workmen's Compensation Act, 1897, a scheme in substitution of the Act had been certified by the Registrar of Friendly Societies and subscribed to by the workman, which, on the passing of the Workmen's Compensation Act, 1906, was recertified by the Registrar of Friendly Societies, and the point in dispute was whether this scheme was in force so as to bind the workman, or whether he could claim the ordinary compensation in an arbitration. Under sect. 3 of the Act of 1897 the Registrar had to certify whether the scheme "is on the whole not less favourable to the general body of the workmen and their dependants than the provisions of the Act." The Act of 1906, sect. 3, contains a new condition, as the Registrar must certify that the scheme contains scales of compensation not less favourable than those in the Act, and also that a majority of the workmen ascertained by ballot are in favour of the scheme, and there are further restrictions, such as that no scheme shall be certified which makes subscription to a scheme the condition of living.

It was contended on the part of the workman, who had subscribed to the scheme when recertified, that the scheme was invalid because no ballot of the workmen had been taken on the recertification of the scheme. The majority of the Court held that where a scheme is recertified under sect. 15 of the Act of 1906 there is no justification in insisting on a fresh ballot; but Lord Justice Fletcher Moulton dissented from this view, and, having regard to the terms of sub-sects. 3 of sect. 15, there is much to be said in favour of the opinion he expressed. This sub-section provides:—"The Registrar shall recertify any such scheme," *i.e.*, a scheme under the Act of 1897, "if it is proved to his satisfaction that the scheme conforms, or has been so modified as to conform, with the provisions of this Act as to schemes."

It is a great pity that the Legislature should have used language so ambiguous on a point of such importance.

London Drainage By-Laws.

In our Law Reports recently we reported a case heard before a London Police Magistrate in which the Chairman of the London County Council was summoned for having soil pipes within the house constructed of iron instead of drawn lead, as required by the London County Council by-laws. There was also a summons for having failed to deposit plans, and in respect of this latter summons a nominal penalty was imposed. As regards the other summons, the learned magistrate dismissed it on the ground that the Council had not convinced him that the whole pipe was within the house. This decision strikes us as somewhat curious, because we cannot see in the by-laws that there is any question of the whole pipe being within the house. Pipes inside buildings are very properly disallowed, but in the case of existing buildings the by-law provides an exception "when it s necessary to construct such soil pipe the building," in which case its constru prescribed. The by-law following also with connexions of lead pipes with iron To us it seems that an ordinary ind construing the by-law would see th part of a soil pipe within the house m constructed of drawn lead, and th ultimate destination outside the hou nothing to do with the construction pipe within the house, although it m jointed with an iron pipe outside. case under discussion the pipe, partly within the house and partly w was all of iron, and if any effect is given to the by-laws this would clearl to have been an infringement.

LAW REPORTS.

COURT OF APPEAL.

(Before Lords Justices VAUGHAN WI FARWELL, and KENNEDY.)

Action by Contractors against Bris Corporation:

John Aird & Co. *v.* The Corporation of

IN this case the defendants appeale an order of Mr. Justice Scrutton in Cha who, affirming the order of Master Mac refused to stay the action and to re matters in difference between the par the defendants' engineer, Mr. William son Squire, the arbitrator named contract.

Sir R. Finlay, K.C., Mr. Gore Browne and Mr. Inskip, appeared for the appe and Sir A. Cripps, K.C., Mr. Upjohn and Mr. L. Macassey, for the respond

Sir Robert Finlay said that the acti brought by the plaintiffs, the well-know tractors, against the Bristol Corporat recover 171,215*l.* for work and labou and materials provided in connexion w construction of an additional dock an works at Avonmouth, and damages for of contract. The contract involved very work. It was not a lump sum co Attached to it was a schedule of pric the contractors were to be paid in acco with that schedule. The total price wh plaintiffs ultimately claimed was 1,9 They had been paid in accordance w certificates of the Engineer the sum of a mately 1,753,000*l.*, and the action was to recover the balance. The contract co the following clause:—

"If, and whenever, any doubt, disp difference shall arise or happen, during the progress of, or after the com of the works, touching or concerning the or any of them, or of their cost, or to the quantities, qualities, prices, des or manner of work done or executed be done or executed by the contractor the quantity or quality of the material employed therein, or in respect of an tions, omissions, alterations, or de made to, in, or from the works, or a of them, or touching or concerning the ing or intention of this specification, o schedule of quantities and prices or a thereof, or of any drawings, instructi directions referred to in the said specif or which may be furnished or given the progress of the works, or touching cerning any certificate, order, or award may have been made by the Engineer anywise whatsoever relating to the int the Corporation or of the contractor premises, then and in every case such dispute, or difference shall from time be referred to and be settled and dec the Engineer, who shall be competent upon the subject matter of such doubt, or difference, with or without formal r or notice to the contractor or the Corp and who shall judge, decide, order, an mine thereon, and that, whether the be then existing, or completed, or dete and who shall have full power and au to correct and amend any errors or inac in this specification or in the sche quantities and prices, or in any cer order, or award made in pursuance and to the Engineer shall also be refe final determination of any sum or a balance of money to be paid to or from the contractor by the Corpora respect of the works, or any part the of any matter arising under or in co with the contract. Any matter not above as being subject to the final dec the Engineer, and which may become of dispute between the contractor

ration, shall, if so agreed between the
s, be referred for decision to the Con-
g Engineers, or failing agreement, to an
ator to be appointed by the Board of
."

Robert Finlay, continuing, said that the
of the claim in the present case fell within
ms of the first part of that arbitration
as it gave rise to matters which were
sly stated to be matters to be determined
. Squire, who had acted in the matter
contract for the Corporation. The
which had been paid by the Corpora
o the contractors were in accordance
ae Engineer's final certificate. Plaintiffs
d to referring the dispute to Mr. Squire,
the affidavits they set out a number
sons in support of that objection. The
ns which he would cite to the
laid down that there was no valid
on whatever to the inforcement of such
bitration clause as that to say that it
the Engineer arbitrator in matters in
to which he had himself played a very
rable part. The advantages of making
bitrator were obvious. He was familiar
ll matters relating to the contract, and
ld be most expensive to have to begin
o before a gentleman who was not
ut with the matters in dispute. There
legal objection to the Engineer acting
itrator, because in his certificates he
ken views which, as arbitrator, he would
ed upon to review. Upon Mr. Squire's
ional honour the parties had by the
t decided to rely in case of dispute, and
a gentleman of the highest standard
profession. In not one single point had
laintiffs succeeded in taking the case
the ordinary rule laid down by the
ties.

learned Counsel read the affidavit of
wn Clerk of Bristol, solicitor to the
nts, who said that the following
arose on the plaintiffs' claim:—
uestions as to the sufficiency or accuracy
contract drawings, and as to payment
k involved through the rectification of
gs, and as to the non-delivery of the
the works:
isputes as to the meaning of the con-
of contract as to the date at which a
te of completion of the works should
en issued, and as to the withholding of
m monies:
isputes as to the alterations of, or addi-
, or substitution of the contract works,
to the payment of the same and for
pieces of work done, and for materials
by the plaintiffs in course of the
n of the contract work.
hese, Counsel contended, were matters
t was quite competent for the Engineer
with as arbitrator.
earned Counsel then read the affidavit
M. R. Aird, a partner in the plaintiffs'
hich let out six heads, upon which the
f damages was based.
Upjohn said he was prepared to with-
ur of those heads, leaving only two, as
—
laintiffs' claim damages for the failure
aid drawings to represent the nature
work to be executed under the contract
ided by Clause 6 of the said condition
act:
laintiffs claim damages in respect of the
ice and refusal of the Engineer to con-
e elements affecting the cost of addi-
work under the said contract, for the
of settling the price to be paid to the
s for the additional work.
Finlay said Mr. Aird, in his affidavit,
ed that the Engineer had, subsequent
agreement, acted in relation to the
s perversely, unfairly, and unreason-
ntrary to the provisions of the con-
of contract, and that if he acted as
r he would be called upon to adjudi-
his own contract. If misconduct on
of the Engineer had been established
be quite another thing; but it had
shown that he was an unfit person to
. It was unfortunate that charges
n made against the Engineer which
t be supported.
pjohn: We say that the Engineer con-
he Consulting Engineers, thus in a
ting as arbitrator without giving us
ortunity of putting forward our views
matter under discussion. That is a
owever, in respect of which we shall
e to establish any legal damage, and
be dealt with in this action.
Cripps said they made no aspersions
Squire's honour. All they said was
was not a proper person to act as
r.
rned Counsel, on behalf of respondents,
d that the discretion of the Master
and learned Judge below ought not to be interfered with. He submitted that the authorities showed that there were no limits to the cases as to which a judge might exercise his discretion by refusing to stay proceedings, and they further made it clear that where facts arose subsequent to the making of a contract which rendered it unlikely that the appointed tribunal would deal impartially with the dispute an application to stay an independent action ought not to be granted.

At the conclusion of the arguments of Counsel on the 26th ult.,

Lord Justice Vaughan Williams, in delivering judgment, said he was very glad to find that it was not alleged on behalf of the respondents that it was always necessary to show there was misconduct in the sense of involving *mens rea* if it was desired to interfere with the exercise of the arbitrator's powers. In the present case many charges had been made against the Engineer, charges which certainly did involve *mens rea*, and which really imputed moral misconduct to him. Those charges ought not to have been made, and Sir Alfred Cripps had said that he regretted very much that they had been made, and he accepted the position that there was no ground whatsoever for making these charges against the Engineer involving moral misconduct on his part.

He (the Lord Justice) would show what consequences must follow from the fact of such charges having been made. He was not going to say anything inconsistent with the judgment of Lord Justice Bowen in the case of Jackson *v.* The Barry Railway Company. He recognised the full authority of that case, and he did not think that, although certain passages in subsequent judgments had been relied upon as suggesting that that judgment of Lord Justice Bowen should be qualified, it was intended so to do. The principal case which had been relied on by the appellants was G. Freeman & Sons *v.* Chester Rural District Council, and it was suggested that some observations of the Master of the Rolls in his short judgment had in some way modified the judgment of Lord Justice Bowen. He quite understood the arguments that had been put forward, but he did not think those words were intended to have the effect for which the appellants contended. He (the Lord Justice) would act on what had been laid down by Lord Justice Bowen.

In the present case there was one very peculiar circumstance, and that was that of all the matters which had been alleged against the Engineer there were really only two of any substance. As regarded these, they did not arise out of the original agreement between the parties; they did not fall within the schedule of prices where the price paid depended on the original schedule. The affidavits stated that specific agreements had been entered into, and that the Engineer had departed from them. In such a case it was true to say that, in so far as the Engineer differed from the statement that agreements had been entered into and actually denied it, he was really acting as arbitrator in his own case. The question, therefore, to be determined was whether the Engineer had in fact entered into these agreements, and whether he had departed from them. In his judgment there was a strong *prima facie* case made as to the existence of these agreements, as well as a *prima facie* case of a departure from them. He would not go into the details, because the action would have to go on, and it was not desirable at that stage to discuss the evidence. Putting it shortly, he was of opinion that in these two matters it was not desirable that the Engineer should act as arbitrator. In these circumstances, therefore, the appeal failed. As to what ought to happen by reason of these imputations against the Engineer being unnecessarily and unjustly introduced in the affidavits, he thought that the costs below, so far as they had been increased by the charges of moral misconduct against the Engineer, should be borne by the contractors. He thought it was very necessary to mark how strongly the Court thought these charges ought not to have been made. As regarded the costs in the Court of Appeal, he thought they ought to be costs in the cause.

Lord Justice Farwell and Lord Justice Kennedy delivered judgments to the same effect.

FOREIGN AND COLONIAL.

Hotel, Brazil.

Information has been received regarding a proposal to erect a first-class hotel at a seaside resort in Brazil. The construction of a pier similar to those at English bathing resorts is also under consideration. Further particulars may be obtained by British contractors and manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Building Work, Austria-Hungary.

According to the *Zentral Anzeiger* (Vienna) of February 22, the municipal authorities of Kolozsvár (Hungary) propose to arrange for the carrying out of a number of important works during 1912, including the following:—The erection of schools and other buildings, 1,440,000 kronen; sewerage works extension, 300,000 kronen; enlargement of artificial ice works, 40,000 kronen; street paving, 500,000 kronen; electric works extension, 705,000 kronen; the construction of a market hall, together with city lodging-house, 1,180,000 kronen; erection of workmen's dwellings, 500,000 kronen; fire-station, 200,000 kronen.

OBITUARY.

Mr. G. E. Pritchett, F.S.A.

We much regret to record the death of Mr. George Edward Pritchett, F.S.A., of Oak Hall, Bishop's Stortford. According to the *Hertfordshire Mercury*, the deceased gentleman was the fifth and last surviving son of the Rev. C. R. Pritchett, Rector of Hallingbury from 1835 to 1849. He was born at the Charterhouse, London, where his father was Reader from 1809 to 1835, on June 14, 1824, and he was consequently in his eighty-eighth year. He married in 1864 Sophia Amelia, daughter of the late Rev. W. Gibbs Barker, who predeceased him, leaving three sons and two daughters. Mr. Pritchett was educated at Charterhouse, as were all his sons, and as the oldest Old Carthusian he was present at the recent tercentenary banquet at the Charterhouse. His connexion with the Charterhouse was maintained for fifty years, during which period he was architect and surveyor to the Charterhouse estates, comprising chiefly churches and farms in the counties of Essex, Cambs, and Hunts. He commenced practice as an architect in North-street, Bishop's Stortford, in 1849, and later he had London offices in Lombard-street and Spring-gardens. For some time he was a Lieutenant in the Artillery Company of the old West Essex Yeomanry Cavalry. Mr. Pritchett was also a Fellow of the Society of Antiquaries, a Fellow of the Royal Institute of British Architects, a member of the Council of the Essex Archæological Society, a member of the Essex Field Club, the Röntgen Society, etc. As an architect he was chiefly concerned with ecclesiastical buildings, and among churches, schools, and rectories in Hertfordshire which testify to his work are St. Michael's, Bishop's Stortford, All Saints, Hockerill, Furneaux Pelham, Stocking Pelham, Albury (chancel), Great Hadham, Eastwick, Hoddesdon, Widford, Allen's Green, Hitchin, Sawbridgeworth, and High Wych (church, vicarage, schools, and curatage). In Essex, Suffolk, Cambs, and Hunts there are many other of his works. The Saunder's Memorial in the Chapel of Charterhouse was also his work. He lived to see the schools he built at Harlow and Epping celebrate their fiftieth anniversary, and the completion in December last of Therfield Church, near Royston, the plans for which he drew thirty-nine years ago. Mr. Pritchett built Oak Hall, Bishop's Stortford, in the early sixties. It took three years to complete, and is filled with a valuable collection of local antiquities and curios. The funeral of the deceased took place in Little Hallingbury Churchyard.

EAST LONDON, SOUTH AFRICA.

One of the most promising areas in South Africa is the district surrounding the port of East London. The opportunities which await manufacturers and others are set forth in a book of information and statistics compiled under the joint direction of the East London Municipality and the General Manager of the South African Railways. The book, which bears the title "East London: Commercial Resources and Industrial Possibilities," gives the railway and water rates, particulars of the local markets, the price of labour, full electric light and power, etc., and details regarding the various openings which exist for the establishment of new industries. The book may be obtained gratis on application to The High Commissioner for the Union of South Africa, 32, Victoria-street, S.W.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) ar advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xviii.; Auction Sales, xxiv Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do n bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will b made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while eve endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

MARCH 9. — **London, E.C.** — NEW OFFICES.—The Port of London Authority invite preliminary sketch designs for new head offices in Trinity-square, and for laying out remainder of land as a building site. See advertisement in issue of November 24 for further particulars.

MARCH 15. — **Drammen, Norway.**—RAILWAY-STATION.—Particulars from the Norges Statsbaner, Christiania.

MARCH 15. — **Prestatyn, North Wales.** — LAYING-OUT ESTATE.—Lord Aberconway and the Trustees of the Prestatyn Estate invite designs for laying-out of the estate Three premiums are offered. Particulars from 33, Henrietta-street, W.C. See advertisement in issue of January 5 for further particulars.

MARCH 16. — **Harrow.** — PUBLIC OFFICES.—The Harrow-on-the-Hill U.D.C. invite tenders for the enlargement of and alterations to their Public Offices. See advertisement in issue of January 5 for further particulars.

MARCH 25.—**Colchester.** SCHOOL.—Limited to architects practising in the borough.

MARCH 30.—**Edinburgh.**—MEMORIAL TO KING EDWARD.—Limited. See Competition News, p. 151, February 9.

MARCH 31.—**Manitoba, Canada.**—PARLIAMENT BUILDINGS.—The Government of Manitoba invite designs for the new Parliament buildings to be erected in the City of Winnipeg. See advertisement in issue of February 9 for further particulars.

APRIL 4.—**Portland.**—COUNCIL OFFICES.—The Portland U.D.C. invite competitive designs for Council Offices. Premiums of 50*l.* and 10*l.* are offered. See advertisement in issue of February 23 for further particulars.

APRIL 20.—**Birmingham.**—BLUE COAT SCHOOL.—Limited to local architects. Assessors, Mr. G. H. Hunt, F.R.I.B.A., and Mr. C. E. Bateman, F.R.I.B.A. Particulars from the Secretary, the Blue Coat School, Birmingham.

MAY 1.—**Rhos Ruabon.**—PAIR OF WORKMEN'S COTTAGES.—Premiums of 10*l.* and 5*l.* Assessor, Mr. Raymond Unwin, F.R.I.B.A. Particulars from Mr. G. Meirion Griffiths, Rhos Ruabon.

MAY 1. — **Wombwell.**—SWIMMING BATHS.—The Wombwell U.D.C. invite designs in competition for public swimming baths, to be erected in Hough-lane, Wombwell, Yorkshire. Three prizes of the value of 40*l.*, 30*l.*, and 20*l.* respectively are offered for the designs placed first, second and third respectively, by the assessor. See advertisement in issue of February 16 for further particulars.

* MAY 15.—**Portland.**—COUNCIL OFFICES.—The Portland U.D.C. invite competitive designs and plans for Council Offices. See advertisement in this issue for further particulars.

JUNE 28. — **Hale, Cheshire.**—TOWN PLANNING SCHEME.—Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale.

JUNE 30.—**Padiham.**—TOWN HALL, BATHS, ETC.—Premiums 40*l.* and 20*l.* Particulars from Mr. J. Gregson, A.M.Inst.C.E., Surveyor's Office, Padiham.

JULY 1. — **Dusseldorf.** — A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

AUGUST 30. — SAXON SNELL PRIZE. — Fifty guineas; with medal, is offered for essay on a hospital subject. Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

NO DATE. — **Cardiff.** — FOOTBALL STANDS —Premiums 30*l.*, 20*l.*, and 10*l.* Particulars from Mr. C. S. Arthur, 53, Queen-street, Cardiff.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in Competition News, December 1, page 635.

NO DATE. — **Ormskirk.** — CLUB-HOUSE.—Competitive plans are invited for proposed club-house for Ormskirk Golf Club. See advertisement in issue of March 1 for further particulars.

NO DATE. — **Sheffield.** — CRIPPLES' HOME. — Limited to local architects. Mr. E. M. Gibbs, F.R.I.B.A., and Mr. F. E. P. Edwards, F.R.I.B.A., assessors.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

MARCH 8. — **Gwernydomen.** — COTTAGE.—Erection of a cottage and set of farm buildings. Plans and specification seen, and quantities from Mr. W. E. R. Allen, Deputy-Clerk of the County Council, Glamorgan C.C. Offices, Westgate-street, Cardiff.

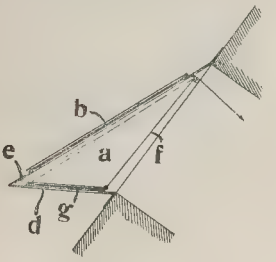
24,489 of 1911.—Wilhelm Lehmuth: Devices for automatically unbolting doors at predetermined times.

SELECTED PATENTS.

22,795 of 1910.—Harold Merrylees and Merrylees & Co., Ltd.: Hollow building-blocks.

This relates to interlocking hollow blocks for floors or walls, which are shaped as shown, and are made from sawdust, magnesia, and a solution of magnesium chloride. An intimate mixture of 30 per cent. of sawdust and 70 per cent. of magnesia is added to the magnesium chloride solution, until the resulting mixture is plastic. A hollow wall with reinforcing-rods



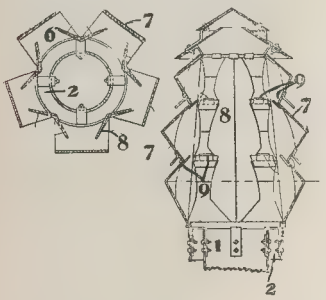
22,795 of 1910.

13 may be formed from such blocks, the blocks being formed with the whole of the upper and lower edges respectively in line, instead of with offset portions.

22,879 of 1910.—Friedrich Hahn: Windows.

This relates to windows through which, when open, rain or snow cannot enter, and which can be fitted in walls or roofs at any inclination, and consists in the provision of a wedge-shaped frame *a*, the lower end *d* of which is

inclined or horizontal and is fitted with an inwardly-opening window *g*; this is pivoted



22,879 of 1910.

at *e* to the frame *a*, is opened by a cord *f*, and closes by its own weight. The side *b* of the frame *a* is glazed.

23,698 of 1910.—John Law Garsed: Chimney and ventilating shaft tops.

This relates to the top of a shaft 1, which is surrounded by a ring, thus forming an annular passage 2. Secured to the ring are two sets of plates 7 and 8, connected together at the top, the whole thus forming a somewhat tapering structure. The plates are of shallow V-section, and are so spaced as to

23,698 of 1910.

leave vertical slots 6, which are shielded by the plates 7. The plates 7 are of zigzag vertical section, and are joined at their inner bends to the plates 8, thus dividing the vertical slots 6 into series of vertical apertures. Shielded apertures 9 are provided in the downwardly facing limbs of the plates 7. One or more convex covers complete the top.

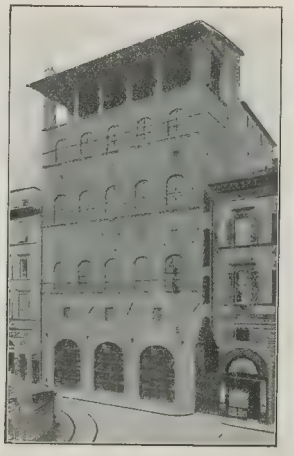
"WHY EMPLOY ARCHITECTS?"

THIS question has often been asked by persons who have no adequate notion of the complicated nature of an architect's work. They perhaps think of an architect as a kind of high-flown gentleman who charges large fees for preparing beautifully-coloured drawings and nothing more. Some of them may have derived their notions of the profession from the memoirs of the Rev. Sydney Smith, who paid an architect five-and-twenty guineas for a set of plans which were absolutely useless, and then set to work, aided solely by his mother-wit, to build his own house, which, he afterwards admitted, was the ugliest in the county. We can all sympathise with the reverend gentleman, if indeed his case has not been exaggerated, and we can believe that there were Pecksniffs in his day, although there is no room for them now.

Persons who imagine that money is to be saved by dispensing with the services of an architect usually place themselves in the hands of some firm who undertake to combine the functions of architect and builder. It has been argued that, since these functions used to be combined in the Middle Ages, the same state of things ought to be possible to-day. The reply would, of course, be that, in the complex conditions under which modern work is carried out, a specialisation of functions has become a necessity of our times. It is not surprising that an ignorant client or customer should fail to grasp this point, though a little reflection might convince him that the work of



preparing plans must be paid for in some way. We have previously referred in these columns to the system of offering plans and estimates "free of charge." Such offers are calculated to attract the class of mind that expects to obtain something from nothing. But it is strange that persons bent on economy should not perceive that the expense of furnishing plans and estimates free to those who do not authorise the execution of works must be shared amongst those who do.

Some years ago a firm of building contractors established an architectural department as an adjunct to their business, and continued for some time to undertake work that is usually done by architects. In the result, a large amount of business came into their hands which would otherwise probably have flowed into other channels; but they found that they had lost certain other business which would have been obtained through the recommendation of architects, and, balancing loss against gain, they concluded that the new arrangement was not in the long run remunerative, and they ended by abolishing their architectural department.

The above instance emphasises one aspect of the question. Architects, being human, are naturally unwilling to employ building firms who make a practice of usurping professional functions. This, however, does not prevent a building owner who regards architects as "expensive luxuries" from employing such firms. He may learn by experience the disadvantages of the system which he is helping to support. It may be asked, In what way is the question likely to impress itself upon his mind?

A leading firm has assured the writer that they always prefer, when possible, to work under an independent architect, as such an arrangement relieves them of much responsibility. Competition compels them to undertake architectural work in order to secure a large amount of custom which would otherwise be lost to them; but such work is never quite satisfactory to them. The fact is that the building owner who dreads the expense of employing an architect has at the back of his mind a lurking suspicion, born of ignorance and therefore often ill-founded, that his builder seeks to persuade him to sanction unnecessary works in order to run up a large bill of "extras." Such suspicions are exceedingly embarrassing to a building firm, and often prevent them from advising their customer to take the course which they know to be the best in his interest. When, however, there is an independent professional adviser standing between the building owner and the builder, no such suspicions against the latter can arise. There are, indeed, persons ready to mistrust everyone, including their architect. They may argue that, whereas it is in a solicitor's interest to create legal difficulties, and in a physician's interest to postpone a patient's recovery, in order to add to professional charges, so is it in an architect's interest to increase the cost of a building in order to enhance his own emolument of 5 per cent. Such a low view of professional men's general conduct may be justified in some cases, because dishonest men are to be found in all ranks of life; but every intelligent architect knows that the policy suggested above would lead to a loss of practice far outweighing in value the immediate gain.

There is another kind of suspicion to which an architect is open, namely, that of favouring his client at the expense of the builder. The difficulties of an architect's position in this connexion were emphasised in the discussion on "The Newer Responsibilities of Architects" at the R.I.B.A. last January. The architect is now the agent of the building owner, and anon he is called upon to arbitrate between him and the builder. It might be argued that, whereas an architect cannot afford to offend his client, he cannot be expected to act impartially between client and builder in any dispute between them. "You are the builder's man," said an architect to a quantity surveyor some years ago. "True," retorted the surveyor, "but I am driven to that position because you are the client's man, instead of being impartial, as you ought to be." No doubt there are grounds for such complaints at times, but from the building owner's point of view this is no reason against employing architects.

The Palazzo Davanzati, Florence.

A FLORENTINE PALACE.

A SHORT time back we discussed the type of museum best calculated to interest the public, and pointed out, in dealing with past epochs, the desirability of calling up a vivid picture of the manner of life and the customs of the times illustrated.

Such a view has guided Professor Elia Volpi in his dealings with the XIVth-century Florentine palace, now known as the Palazzo Davanzati. When this property came into Professor Volpi's possession in 1904 the rooms had been subdivided and modernised, but he made it his task to restore the whole building as nearly as possible to the condition in which it existed in the XVIth century.

The palace, however, does not date from this period, being already some 300 years old when it passed, in 1578, i the hands of the family whose name now bears. Small and unpretentio compared with great blocks like Strozzi and Pitti palaces, it must nev theless have been, at the time it w built, one of the most important priva palaces in the city, and even after occupation by the Davizzi family for th centuries it must still have been regard as a well-appointed and commodio residence, judging from the fact that purchasers, the Davanzati, were one the most prominent families in Floren at that time, and that they did not fi it necessary to make any very drast alterations to the building.

In accordance with the conditio prevailing in a mediæval walled city t palace is of a considerable height proportion to its area. The main façad in the Via Porta Rossa has a heig nearly double the frontage, and consis of four lofty floors of the XIVth centur crowned by the loggia added by t Davanzati in the XVIth, but as t upper room was lowered in forming th loggia and the high battlemented parap was then removed the proportions the façade were not greatly altered.

The building was originally detache on the other three sides, but only b means of narrow alleys, now partiall built over. Its depth is slightly mor than the width, and the back follows somewhat irregular line.

Of the five floors above the groun level, the first, second, and third ar similar in plan, and seem to have bee occupied as distinct residences even fro quite early times.

The main façade faces north, and it whole length on each of these floors i taken up by the principal saloon behind this are placed, on the east side the kitchen offices, in the centre a smal court containing the staircase, and on th west a second large saloon extending to the back of the building; behind th kitchen and courtyard are the bedrooms

The ground floor seems to have bee mainly occupied by the guard and retainers, and occasional onslaughts were evidently anticipated, as in the floor of the saloon over the entrance hall there are a number of apertures through which missiles could be discharged on an attacking party that by craft or force might have succeeded in getting through the massive entrance-door. We can picture that if a hand-to-hand struggle were going on in the hall the defenders might be materially assisted by those in the room above.

Interesting though they are, the arrangements of the building are not the most important features of this palace; these may be found in generally similar lines elsewhere. Neither does the collection of furniture, valuable though it is as an assistance in realising the original effect of the rooms, possess a claim to go beyond what can be found in other collections. No, the great and outstanding interest of the Palazzo Davanzati lies in the remarkable preservation of the characteristic and beautiful mediæval decorations. We know of no other case in which a private palace of this period has retained the wall paintings in so perfect a state, and in which it is possible to see the rooms

ost exactly as they were in the XIVth ury. The more important rooms e hung with textiles or tapestries, as ident from the hooks for this purpose h still remain. We would give h to see these original hangings, alas, they have probably long since shed! In the principal bedrooms, ever, the walls were painted from to ceiling, the upper part being n up to a decorative frieze (see es), while the lower imitated the gings which were to be found in the e position in the saloons. Judging he pattern of these painted coverings, actual ones in use were probably en material, geometrical in design, gh, of course, it is quite possible that genuine hangings were either richer pattern or perhaps of tapestry. If take contemporary paintings as a le, the more likely material is one with peating pattern, such as we may find mall pieces in the principal museums. he main interest of the painted work naturally concentrated in the frieze, being clear of the furnishings. In illustrations given it will be seen that painted diaper patterns on the lower tion of the walls clearly represent gings, as the top edge is either a esentation of rings on a rod or shown lightly dropping from nails at inter- ; above this is an indication of ble slabs with inlaid margins, and the ze in each case represents a land- pe or garden scene visible through nings in an arcade or loggia. While treatment is varied in each case, the eral scheme is the same. Thus he second-floor room the frieze is more naturalistic and varied in the peacock-room. These and some smaller birds are the only incidents that break the uniformity of a formal arrangement of trees and heraldic shields. In the third-floor room, also, each panel between the painted columns has repeating motive composed of vases and foliage. The work throughout displays considerable fertility of invention, while the rich and harmonious colouring compares favourably with the more accomplished work of the succeeding century.

NOTES.

The Associates and the R.I.B.A.

We do not suppose that the concluding sentence of our leading article, which Mr. Horace Bonner did us the honour to quote at a recent meeting of the R.I.B.A., conveys to all our readers the meaning which, to judge from his interpolated explanations, it appears to convey to him. Our remark might be equally true if interpreted in this way, but it does not happen to be what we meant. We referred to the interests of the general public or of the State, and not to those of the members of the Institute. Possibly, however, Mr. Bonner only intended to express the opinion that the two things are always identical, and that in mentioning one we might reasonably be supposed to be referring to the other; whereas it was our profound sense of the occasional difference, even antagonism, between them, and of the possibility in an imperfect world of privileges clashing with public duty that prompted our observation. This is a point that we think should be borne in mind, for a charter not only confers privileges, but also entails responsibilities towards the State which grants it.

Lambeth Bridge.

We are glad to see that Parliament has again risen to the occasion and declined to sanction the reconstruction of Lambeth Bridge on lines which would be unworthy of its position. Mr. John Burns in supporting the opposition has done another good day's work for London. When the Committee's proposal for a second and narrower bridge was first put forward we called attention to the fact that it appeared to provide for less traffic than the original scheme, without giving any reasons why a decrease of traffic was to be anticipated. We suppose, however, it is again the same question of misplaced economy not unconnected perhaps with the question of party politics. It certainly does seem a pity that this should be the case, and that improvements which so vitally affect the general amenities of the city should be at the mercy of a party vote. Surely it should be possible to lift them to a higher plane and for the two parties to come to some common agreement as to what London should look like and as to the scale on which public monuments should be conceived and carried out. There may, no doubt, be political differences of opinion as to whether a certain improvement is advisable or not, but any difference of opinion as to the method whereby it is done should be technical rather than political.

The Palazzo Davanzati, Florence: Principal Salon, Second Floor.

Anyone who introduces continuity of policy in these matters will do another good day's work for London.

Preservation of Ancient Monuments. THE announcement that the First Commissioner of Works will introduce a Bill dealing with the preservation of ancient and historic monuments will be received with general satisfaction. The need for some step of the kind has long existed; but after the Tattershall Castle muddle it was obvious that matters could not be left where they were, and it became a question only of how long Government action would be delayed. The proposed demolition of the Reindeer Inn at Banbury seems to have brought matters to a head, and we shall look forward with interest to the appearance of the proposed Bill. What France and other countries can do by scheduling ancient buildings in order to guard and preserve them as national treasures should have been done here long ago, and the early date promised for the introduction of the Bill in the House of Commons is an indication that the Government at last realise their responsibilities.

The Improvement of London. THE speech delivered by the King when laying the foundation-stone of the New County Hall for London, with its reference to London as not only the capital of the Empire, but as in many respects the centre of the world, may be taken, we hope, as an indication that the State is alive to the importance of making London more worthy architecturally of its high destiny, and that all efforts in this direction will never lack the sympathy and support of the State. The reference to the growth of efficiency, which is the result of carrying on deliberations in surroundings worthy of their importance, has an application to every sphere of life, and may well be borne in mind by all local authorities throughout the land. Rightly understood, this consideration may indeed be said to be the *raison d'être* of architecture. The value of its influence in all the affairs of life, whether public or private, needs no further justification. The recognition of this by the Chief of the State, with special reference to the public monuments of London, will do much, we are sure, to rouse that sense of civic pride in which London hitherto has been so sadly lacking.

Combined Heating and Power Plant. CENTRAL heating installations for groups of buildings, such as modern hospitals, asylums, and workhouses, are quite familiar to architects of to-day, but a somewhat unusual arrangement is that of the combined central heating, electric light and power station now in operation at McGill University, Montreal, described in the paper read by Mr. R. J. Durley to the Institution of Civil Engineers recently. Up to 1908 the buildings were heated by independent steam or hot-water equipment, and electricity was obtained from the local supply company. With the object of effecting important savings, the authorities laid down their own electricity generating plant, with a central boiler-house, and have been able in consequence to use fuel of much cheaper quality than heretofore, and to utilise exhaust steam on an extensive scale for warming purposes. The system fully deserves the consideration of architects engaged in the design of large public institutions.

The New Indian Capital. THE announcement which appeared in the daily Press on Wednesday will be read with interest by architects and especially by readers of this journal. The Secretary of State for India has, at the request of the Government of India, appointed a Committee of experts to advise the Government of India as to the site of the new capital at Delhi and the laying out of the same. The Committee will consist of Captain George Swinton, Chairman of the London County Council; Mr. John A. Brodie, C.E., City Engineer, Liverpool; Mr. E. L. Lutyens, F.R.I.B.A.; and Mr. H. V. Lanchester, F.R.I.B.A. The Committee will assemble at Delhi about the middle of April, where it will find materials ready for consideration, and will have the assistance of the Department of Indian Public Works and of other Departments of the Indian Government. Its work, which will be of a general and preliminary nature, and will involve no questions of detailed planning or architectural design, is expected to occupy four or five months.

AN ordinary general meeting of the Architectural Association was held on Monday at No. 18, Tufton-street, Westminster, S.W., when Mr. Gerald Horsley, President, occupied the chair.

Mr. Hall, Hon. Secretary, made the following announcements:—

The Fifth Spring Visit on March 16, to King's College Hospital, Denmark-hill (architect, Mr. W. A. Pite, F.R.I.B.A.).

The Annual Smoking Concert and Revel of the A.A. Athletic Club, on March 26, at eight o'clock, at the Pillar Hall, Victoria Station Restaurant.

The President announced the Council's nominations for the House List for Session 1912-13, as follows:—

House List, Session 1912-13.

President.—Mr. Gerald C. Horsley.
Vice-Presidents.—Mr. W. Curtis Green, Mr. Maurice E. Webb.
Hon. Secretary.—Mr. H. A. Hall.
Hon. Librarian.—Mr. W. H. Ward.
Hon. Editor A.A. Journal.—Mr. P. Cart de Lafontaine.
Hon. Treasurer.—Mr. Arthur Keen.
Council.—Messrs. A. T. Bolton, C. C. Brewer, H. P. Burke Downing, F. C. Eden, G. L. Elkington, Stanley Hamp, A. G. Horsnell, Geoffry Lucas, Winton Newman, T. Fyfe, W. G. Newton, A. G. R. Mackenzie, W. J. Tapper, Gilbert A. Scott, Alan J. Slater.

The President announced that a special general meeting had been held, and that the following alteration of By-law 36 had been passed:—"The office of Hon. Secretary shall not be held for more than *two sessions consecutively*."

On the motion of the President, the following votes of thanks were accorded:—

To Mr. G. Norbury for kindly presenting a number of cork models of various English cathedrals to the Association.

To the Secretary of the Hampstead Garden Suburb Trust for kindly conducting a party of members over the two new churches and institute, upon the occasion of the Fourth Spring Visit, to the Garden Suburb, on March 9; also to Mr. E. L. Lutyens for kindly allowing drawings to be exhibited.

To the Society of Dilettanti for kindly presenting plates from Penrose's "Athenian Architecture" to the Association.

AMERICAN ARCHITECTURE.

Mr. C. A. Daubney then read a paper entitled "American Architecture." He said:—

"We may criticise here and there, condemn this and that, and express approval of isolated works, but in architecture it is still true that there are no discoveries similar to those in the realm of science which flash like beacons in the night or which open up untrodden of progress and leave the old ones discredited and to decay.

New forms of construction and materials it is true, may be at the disposal of the architect. He may experiment with them at his own or at his client's cost, but his art will be little affected thereby.

Rivalry or striving after effect does not account for the subtle variations in contemporaneous architecture in its best periods.

Local differences of climate, material, and resources played some part in affecting change in detail, but in every case the artist had before him general principles and great ideals, which were surely little affected by local affairs.

He built literally in many cases upon the ruins of his predecessor's work, but he had scrupulous regard for the best that had gone before.

I dare not hope to reveal to you to-night any startling ideal in American architecture at the present day. There is much in it that is good and hopeful side by side with much that is bad and hopeless. All I can do is to indicate certain phases which may lead you to investigate and study the subject more fully. I am reminded that architecture is the graveyard of many an accepted platitude. Genius, said Carlyle, is the transcendent capacity of taking trouble first of all. Hogarth similarly said that genius is nothing but labour and diligence; while Matthew Arnold adds his verdict that genius is mainly an affair of energy.

If such be true, we should find a genius at every street corner, more particularly in New York, Chicago, and the other great cities of the States, where the painstaking efforts of the architects cannot be denied. Then, too, the belief that the pathway to Hades is paved with good intentions is flatly contradicted where architecture is concerned.

None will deny that it is an upward path, and not a downward one, which is trodden by those who set out equipped with a good intention and an earnest desire to do good work.

It is the servile copyist, the architect with no intentions, who will find his place on the slippery slope. He has not within him that dynamic force which will overcome the downward drag of the commercial world, the vanity of the flesh and the devil of competition. The subject divides itself naturally into environment, execution, and education.

Environment.

It is reported that a lady from the States, on seeing the lawn in front of one of our University colleges, approached an attendant and inquired as to how the thing was produced. She had a lawn, on which money had been lavishly expended, but it was a failure compared with this one. "We rolls it," replied the man, "and we waters it. Then we waters it and we rolls it for about 400 years, and it always comes out all right."

In considering American architecture we are bound to recognise its recent birth.

re is no long line of tradition to steady pencil and to guide the pen. ubstantially no historic masterpieces ng from the heroic times are readily at d for study and reverence. The archi- must largely import his ideas, and must t in the preparation of his designs to very unsatisfactory evidence of illus- ions and photographs rather than to the ks themselves.

moment's consideration will show that such circumstances two things must pen. The strong man will demand to e before him clear and explicit records he best works corresponding to that upon h he is engaged. If he cannot recreate r atmosphere, he will at least grasp the il. His work shall be correct and nically good, even if in the transportation he design the spirit has been irretrievably The weak man, on the other hand, will bably try to distract attention from his ciencies by riding off on his own un- lated fancies into realms of wild experi- t which other workers of mature experi- have long since learned to shun. some such way it is possible to account the extreme care and completeness of h of the work.

mparisons are always odious, but one is ed to the conclusion that the nakedness ome of the modern work on this side is entirely due to the poverty of the client o a desire for severe simplicity at any , but rather to a lack of capacity on the of the designer to tackle a more ornate possibly more appropriate scheme.

he rapid growth of the country on all ds demands that the architect should ess great capacity for work and organi- on, and must be ready to switch off his from the elaborate calculations for a craper to the design for a cathedral, an bition building or a pavilion in the park. nture to suggest that there are few—if —of our architects who could control a staff as is to be found in some erican establishments. One cannot, of se, magnify beyond its proper limit the ue of expedition in the preparation of ing drawings, but there is something to aid in the favour of those who can, for ance, prepare in six weeks the complete wings, including all the necessary elabo- d calculations, plans, and details, for a ion-dollar skyscraper. It demands a sure certain grasp of the business and a com- e knowledge of at least one side of the ession.

nother factor having important bearing the architectural problem is the rapid lopment and change on every hand. hin the last generation, for instance, the er part of New York business centre been rebuilt, not for the reason that the dings were decayed or unsuited to the ls of the times, but solely because there a demand for business accommodation h exceeded the supply.

was a perfectly sound financial under- ng to tear down the old buildings and t new ones on the site with increased mmodation obtained by carrying the and the upper stories into the clouds. n architect is not human if he is not lly affected by such an environment. will work for the immediate present and in the knowledge that his building will ll probability be, for good or bad, a last- landmark for the next dozen generations. cue, in many of the more permanent dings, such as the colleges, municipal and e institutions, there is a different element. find there a keen effort to give character he work, if, however, there is some ency towards the fantastic and bizarre. buildings are usually subject to com- tion, and in view of the shifting acter of personnel of the local authorities not to be wondered at that the attrac- design may be the successful one, whereas more appropriate one is ignored.

might be hoped that in the smaller dings of permanent character, such as schools, churches, and the like, some e of a national feeling would be found. re, however, is the all-important diffi- y of distance to be contended with in erica. It is almost impossible for the -known men, who, of course, congregate the centres of population, to dea successfully with such comparatively trifling works, often at an enormous distance from their offices.

It is to be feared that these buildings are being more and more dealt with by specialist firms of contractors who are prepared to erect attractive buildings, as per catalogue, in any spot at a fixed rate from New York to San Francisco.

Even in purely domestic work this commercial element is most painfully in evidence, possibly more so than in our own cities. The man who suddenly rises will have no difficulty in finding what he wants from the flood of catalogues of country houses which immediately overflows his letter-box.

The architect is caught in the stream. He must carry out instructions, and the astonishing fact remains that an architect with a wide reputation will erect some hideous monstrosity apparently without turning a hair. He might be forgiven if he were ashamed of the job and endeavoured to forget it as quickly as possible. But this does not obtain. He will advertise his misdeeds without compunction side by side with other works of his own of which he may reasonably be proud.

I was, for instance, taken by a well-known architect to a seaside residence built at some considerable cost, but which, in my opinion, was disfigured beyond redemption by having the principal reception-room panelled throughout in polished red mahogany, in a style which might be appropriate to the bar parlour of a saloon, but certainly out of place in a private house.

Another element which militates against much real progress is the growth of specialists. Not only do the ordinary structural specialists flourish on every hand, but they will go beyond their European prototype by contracting to carry out an architect's small-scale design, with detail and ornament of high technical and perhaps artistic merit, without the architect in the multitude of the other concerns of his profession having to trouble himself too much on this head.

Execution.

The American architect appears to have wider responsibilities than the architect here. This is more particularly true in the case of the larger works. There is a very general understanding that each man should rule his own roost. The architect will be expected to produce a satisfactory result without having to be guided except on general lines by the client. It may be that the client is only building as an investment and knows nothing of good or bad work. In such circumstances the architect will probably find himself with an absolutely free hand.

This will demand from him close attention to rule and convention. Any hostile criticism of eccentricity of design will shake the faith of a purely commercial speculator, and so we find a certain amount of restraint upon originality and genius.

Another restraining element is the fact that in most of the large centres there is a very rigid building regulation which demands the production of full plans, details, and calculations for inspection by the local authority in order that a building permit may be considered. The omission of essential information will delay the permit being issued, and the work itself will be consequently retarded. Novelties or variations from customary procedure will, as may be expected, be looked upon with suspicion by the building officials and cause possibly lengthy explanations and inquiry.

When his building permit is obtained there is the risk of objection by the building inspector if variations from the approved

[From the *Brickbuilder*, Boston.

School of Industrial Arts, Trenton, N.J.
Mr. Cass Gilbert, Architect.

plans are attempted. In this position the architect will also feel compelled to work upon safe lines. He cannot have the luxury of watching his building develop and of making alterations and improvements in the design as the work proceeds.

Of course, the splendid generosity of wealthy patrons frequently affords the architect an opportunity of exhibiting his genius free from all such trammels as have been referred to above. I venture to suggest, however, that these isolated cases do not represent the main stream of architectural life in the country. Remember, too, that native artisans are practically non-existent. The architect may even find it necessary to have his work executed here in England or on the Continent. This cannot conduce to progress.

The crude native sculpture on some Celtic monument is still more highly regarded than the careful carving by the contemporaneous workmen in the streets of Rome of ornament and design copied from the Greeks.

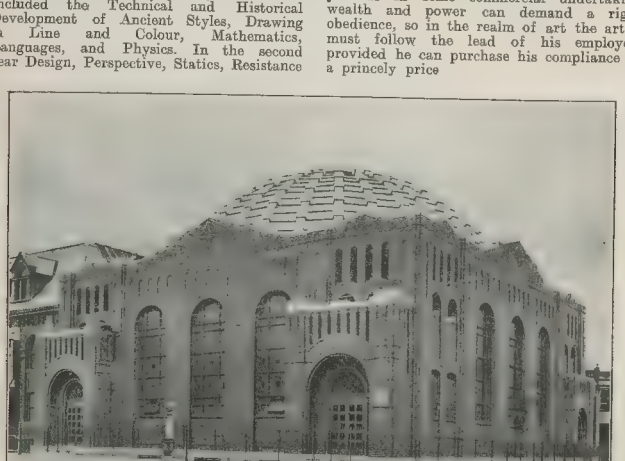
Do not let us forget that we are here discussing American architecture, and I make the distinction between a native effort towards an ideal which shall be characteristic of the land and its marvellous people, and an architecture which may largely consist of careful adaptation of European models, but which shows no real ground for hope of progress in the near future.

Education.

Whatever I have said which seems to criticise adversely modern methods must be discounted in considering future prospects. Architecture will be safe from degeneration if continued effort is made on proper lines to train the coming generations. Not only will it tend to develop the art of architecture, but it offers a restraining influence upon the eager but unqualified who press into a profession which to-day opens up splendid prospects for many a pushful youth.

A high standard of education is becoming more and more essential. The tremendous interests, both public and private, which are at stake in many of the large undertakings demand a technical skill in the first place which does not but rarely obtain here. I think that public sympathy is strong on the side of rigorous examination and qualification for all practising architects. This, of course, is a hopeful sign, and the universities are alive to the necessities of the case.

Harvard, for instance, offered a five-years' course. There was an entrance examination which included English, French, German, Physics, Drawing, and Histories of Greece and Rome. The student had the advantages of a hall of casts, painting-room, exhibition-room, modelling-room, library, photograph darkrooms, etc. The first year's course included the Technical and Historical Development of Ancient Styles, Drawing in Line and Colour, Mathematics, Languages, and Physics. In the second year Design, Perspective, Statics, Resistance of Materials, Mediæval Renaissance, and Modern styles were added. In the third year Building Construction, Theory of Design, Masonry and Foundations, and Mineralogy were taken. In the fourth year, in addition to general topics, two special subjects had to be taken from a list which included Design in Painting, Sculpture, and Architecture, Greek Art, Fine Arts of the Middle Ages and of the Renaissance, Classical Archæology, Private Life of the Romans, Life in Ancient Greece, Landscape Design, Æsthetics, Bridges and Buildings, Health and Ventilation. The average gross cost to the student for residence and education was only 100*l.* per annum.



There was a somewhat similar programme given in connexion with Washington University, and at a somewhat similar cost.

The Massachusetts Institute of Technology at Boston gave a very full five years' course with a continuous training in design for three years' Freehand Drawing throughout and one complete year in the Life Class. A feature of these college courses is the Summer Schools. I have a note of one which was in the form of a tour to Europe particularly for the study of the work in the northern towns of Italy, finishing with a bicycle excursion from Genoa to Paris.

The University of Pennsylvania offered three separate courses—viz., a four-year course leading to the degree of Bachelor of Science in Architecture, another course leading to the degree of Master of Science in Architecture, and a shorter two year course. There was an additional three-years' course in Interior Decoration.

The Syracuse University provides almost equal facilities for the student. These are but illustrations of the facilities for study and preparation for the profession. The total result is generally seen in the fact that the majority of the young men in the offices of practising architects are college men with a college degree. Incidentally, there is a minimum of the mechanical drudgery which in many London offices is handed over to inexperienced youths who may possibly grow up to exploit the special features of the work done by their employers. If one may venture into the realm of prophecy it must be to express the belief that there is a bright prospect for architecture in America.

The question as to whether this will be realised in the near or distant future depends upon one main factor—viz., the education of the public taste for the beautiful. As matters stand at the present time, art may be degraded and good taste may be corrupted by being compelled to follow on the heels of those who act on the principle that just as in some commercial undertaking wealth and power can demand a rigid obedience, so in the realm of art the artist must follow the lead of his employer, provided he can purchase his compliance at a princely price

Linden Baptist Church, Camden, N.J.

Messrs. A. Truscott & A. H. Moses, Associated Architects.

The good time would be brought wit measurable distance by a period of c mercial depression. Architects might t find time to turn their attention to everyday affairs of the community. A te ment house would not then be recogni as now, as a ghastly imitation of a facto or the ordinary suburban dwelling as so thing very much akin to a wooden barn.

Architects might even find time to r protests against the desecration of the pu streets by hideous advertisements encroachments upon the public convenie by corporations whose only concern is the dividends of their shareholders.

There would then grow up a corpor sense of what is good, and that a man sho not have a free hand to offend the good ta of his fellow-citizens, even though he may a successful business advertiser.

In conclusion, may I again venture prophecy that if we are anxious to ma real progress we shall do so only on t lines adopted with success in the State Registration is a futile procedure if it resu only in shutting within a ring fence the go and the bad. We must begin where all r progress begins—in the school and in t workshop, in the public Press, in t common affairs of life. When the authorit who are responsible for the bridges acr our rivers and the lamp-posts in our stree when the factory and mine proprietor w can and does blast the landscape and ru our buildings by the reek of his works, wh the workman, as in days gone by, recogni that it is as easy to make a beautiful thi as it is to make an ugly thing, when the co munity at large expects that the little thin of life shall be presented in a true a beautiful form, we shall have no cause th for anxiety for those larger works whi have too long been looked upon as the on and proper sphere for the architect and arti alike."

Mr. C. C. Brewer followed with some notes impressions gained during a recent visit to t United States. He also showed some lante slides of interesting American work. H said :—

"I would like first to give a preliminar word of warning to any architect conte plating an architectural holiday in Americ namely—get the idea of a holiday out of yo head. Climate, conditions of travel, t amazing—indeed, almost incredible—hosp tality of the nation, and their feveris energy, will combine to make the experien comparable only to some such effort as th of watching from an express train an arch tectural cinematograph in a gale of win and endeavouring to make mental notes the solutions of hitherto unthought-of arch tectural problems. The result is intoxic tion, and on regaining consciousness one impressions are somewhat dimmed.

The chief characteristics of America architecture to-day seem to me to be vigou competence, singleness of purpose. All thes are, of course, the outcome of the nation spirit, the amazing commercial activity, an the climatic conditions. A country pr gressing at the speed of America to-day ha crying need of a race of competent an vigorous architects, and forces them to th single purpose of erecting the best possibl building in the shortest possible time. I leaves them no leisure for the "Hopes an Fears for Architecture" or "Philosophi Doubts." Do not let me be misunderstood I am not suggesting that haste is apparent i the best building of America of to-day, for I hold strongly that the architects are rising with almost incredible success, to meet no only the commercial and practical needs of th community, but to work out artistic prob lems with a certainty, a dignity, and a breadth the equal of which it would be hard to find in any other period. Indeed, I believe the history of architecture of the last twenty years in America will be read almost as a fairy-story by future generations.

Mr. Daubney has hinted at the conditions of rush and hustle under which these build ing are produced, and has not—could not—exaggerate it; nor should it ever be forgotten in judging the results.

It is, indeed, a matter for amazement and admiration that even sky-scrapers, for which the working drawings, of a completeness undreamt of in England, are said to have

n made in a period which would barely ce with us for the preliminary sketches, ot more often skriek aloud to the world horrid tale of the speed of their concep- , labour, and birth.

judging the work of architecture in any try to-day I hold, of course, that it nly fair to put out of court perhaps er cent. of the buildings. We must judge the large public buildings, the railway- ons, the office blocks and stores, and by thoughtful and more serious domestic for either the rich or poor.

n international comparison of cinemato- h palaces, public houses, and the estic vulgarities of the *nouveau riches*, he one hand, or the meannesses of the y-builder on the other, would be neither he point nor profitable, for the first are ly a form of pictorial advertising and jerry buildings are surely temporary tures. In America, however, I believe there is a smaller percentage of both blatant and the mean than in most pean countries, for the Americans are ing with big schemes and new ideas even dvertising, and mean buildings grow less when set in the ample suburbs of rican cities.

an example of what I mean by big s, even in advertising, I would instance new Pennsylvania Railway Station in York.

new station becoming necessary, the idea the finest and largest station in the d might be no bad advertisement seems ave occurred to the directors, and their step was to employ an architect of large fine ideas; their choice fell luckily upon McKim.

seems not only to have entered into scheme, but surely his enthusiasm must carried them on till the undertaking almost in the spirit of cathedral ders. The result is a temple to the glory, nly of the Pennsylvania Railway Com- in particular, but of well-ordered and transport.

u have probably all seen photographs of wonderful building, but no photographs give an impression of the effect which its iess, orderliness, and completeness pro- on coming to it out of the turmoil of York.

agine an entire railway-station with gs and furniture, even to the spittoons, ned by the architects; a railway-station anned and so contrived that there is no nor bustle, where no porters intrude with ge, and where it has even been thought while to forego the profits of the bill- er that all may be well ordered and dig- d. This last was the culminating stroke nius, for the effect of a station, where the notices are subdued and where the tion signs are of bronze set upon marble ts and advertisements are not, upon the accustomed to walls, ticket offices, and s covered with lettering and pictures of size and shape is one of almost be- ring calm. It is as if the Directors had "We will startle the public, not with and noise of our money-making, but dignity and repose."

d so to-day the conception of a rail- station as a dignified thing seems to taken hold of the Americans, and we the big Washington Station and others e same spirit.

mparing these with the three latest ni in London—the Great Central and wo at Victoria, which had not even the to be one—we weep for London.

is idea of the dignity of commercial prise seems growing upon the business and showing itself in the stores, office ings, and banks.

the Americans be learning the market of repose in the midst of their strenu- ife?

may be argued that there is no real ess in this great Pennsylvania Station the hall is a mere translation of the s of Caracalla on, I believe, a larger ; that the detail on this and most other ings of the same type in America is ly taken from Italy or Greece.

is brings me to the wider criticism of architects which is so often made by icans to-day : that they are not evolving ional style.

is surely difficult for contemporaries to judge whether or not a style is being evolved in any art, and it is probable that the same critics, had they lived in the XVth century in Italy, would have been chiding the architects for being mere copyists of the Romans.

I cannot believe that men who are approaching architectural problems with the freshness, vigour, and clearness of thought of the Americans of to-day will not leave behind them something worthy to be called a national style, even if they are content, for the while, to use and reuse the language of the past.

Speed and hustle are the natural parents of copying in architecture. The man, set face to face with enormous problems to be tackled at great speed, turns naturally to the text-book for his details, and I am not sure that, given speed as one of the conditions, the results do not gain in the process, for the architect has the more time for mass and the big idea.

Certain it is that the trend of architectural training in America is to this end—to train competent architects and competent assistants, not thinkers and writers on architecture. The man who knows where to find

chapter and verse in those wonderful libraries which seem to be a *sine qud non* in every large office, and how to use the matter when found with a competent good taste and discretion, is the man to help the designer of big schemes. And I must admit that one rarely sees a draughtsman on the architectural side of a big office without a great folio of Renaissance, or classic art at his elbow.

A word as to training. Mr. Daubney has given a rough sketch of the curriculum in vogue some ten years ago, but has said no word as to the influences at work within the schools themselves. That this is entirely French no one will deny. At the time of my visit Harvard was preparing to celebrate the arrival of a French born, speaking, and trained Professor of Design, and Harvard was the last college to hold out against the Beaux-Arts tradition. All the others had already either Frenchmen or Americans trained in the French manner as their guiding spirits. Harvard and Boston architects had long fought for training on more English lines, but the force of the Beaux-Arts movement, as evidenced by the roll of students in their own and other colleges, counselled surrender.

In the face of this it is a matter of surprise to me that American work is not showing even stronger evidences of French fashion. This may be somewhat accounted for by the great influence of McKim, who, although French-trained, yet drew most of his inspiration for his later work from Italy. But I hope the reason is rather the growing strength of a tradition of their own, a strength fostered by the individuality of the American character, and their brilliant qualities of self-reliance and rapid, straightforward thought.

As to the influence of their own colonial style, this seems to me for the moment under a cloud. Much that has been perpetrated by the jerry-builder under cover of the word colonial has swung the pendulum of fashion a little far from New England and Virginia, and, although many men of taste and culture are using the vernacular in their domestic work, one is a little sorry to find that development along these lines does not seem likely.

The lack of mediæval building in America itself and latterly the Beaux-Arts training no doubt account for the poverty as a whole of the ecclesiastic and domestic work. The wave of the Gothic revival can only have been a feeble ripple by the time it reached the States, for it left behind it a trail of thin and wiry buildings of unimaginable meanness.

Richardson, with his strong, if at times somewhat clumsy, hand, left his mark upon the town halls and churches of his day, and was followed by less strong men, why by their eccentricities soon brought his manner into disrepute.

His influence seems to linger to-day only in the West, where the work of that brilliant architect and contriver of clever detail, Mr. Louis Sulivan, still shows signs of early Richardsonian influence.

The success of Cram & Goodhue's Gothic scheme in the competition for the rebuilding of West Point, and the masterly manner in which they are carrying it through in the face of much adverse criticism, is evidence that there is now a finer feeling for Gothic work. The French and classic tide is not quite sweeping all before it, and there still remains a small but faithful band of thoughtful men—"the Englishmen," they sometimes call themselves—who are fighting against it. The little leaven of their work may not be without good effect upon the lump, especially in the one quality in which American work of to-day seems lacking.

On returning to England our work, at all events in our towns, had a very depressing effect on me. It seemed mean and muddled and with an uncertainty and a hesitancy about it as if we had been for many years without a goal. Our public buildings strongly reminded me of the criticism upon them of a candid American architect, who, when pressed to tell how they struck him, said : "Why, I guess they look like scrambled eggs!" But we seemed, especially in the country, to have one quality which American work had not : I mean the right and truthful use of material.

In the States one's sense of decency and honesty is constantly being hurt and one's nerves jarred by shams so cleverly carried out as to deceive the eye if not the hands. I could quote instances without number, but one must suffice.

There is at West Point a charming memorial hall by McKim; the interior has many bronze ornaments—some are cold to the touch, others more difficult to reach are warm. The entrance to the large hall is through a screen of caryatid figures, ostensibly of bronze; but the discovery of a horrid wound of plaster where two toes have been kicked off seems to take away any value the building may have as a memorial.

The use of stucco for stone, of plaster painted, and most cleverly painted, as oak would seem not to be confined to the music-hall and the saloon, or to the work of vulgar men—such things are surely unworthy of so great and rich a nation.

In England, even in our poverty to-day, we have one great heirloom from our Gothic past, a certain love of honesty in materials, which gives even the weakest of us a sense of shame in their wrong use.

If I might borrow a little American confidence to sum up what seems to me the strongest characteristic of their race, I would say, "Knowing what they want and getting it."

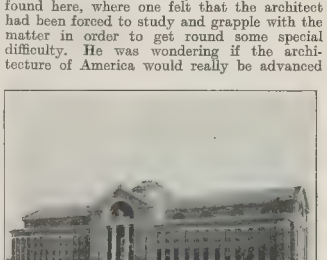
When the architects realise that besides vigour and certainty, competence and dignity,

delicacy and brilliancy, they want also honesty, they will get that too, and then American architecture will come to its own."

Mr. H. M. Fletcher,
in proposing a vote of thanks to Mr. Daubney and Mr. Brewer, said he agreed as to Mr. Brewer's remarks as to the singleness of purpose of the American architects. They intended to go in a certain direction, and they devoted all their mind to get there. They knew what they wanted to make their cities fine, town planning being to them a very real thing, and it was amazing to see the schemes they were producing for different cities, though those schemes did not always get carried out owing to vested interests and so on. He did not suppose that in any other country had there been such splendid plans produced within a few years as those for San Francisco, by Burnham (or rather Burnham & Co.), the centre of Chicago, of Cleveland and Washington. New York was not a fine example of town planning and never could be owing to its cramped site on an island, but all over the States there was a great feeling of rivalry between cities, and that showed how they were aiming at great objects. It was the same with the buildings: attention was given to mass and the grouping of big features and the detail rather went to pieces, sometimes, or it was borrowed from other buildings; but there was a big architectural movement, and it was splendidly backed by the men who had grown rich; they were extraordinarily generous in helping to carry out such schemes.

Mr. Mackenzie
seconded the vote of thanks, and referred to the great progress in American architecture during the four years since he was there. He thought that was owing a great deal to the public interest in architecture in America. As far as he could tell the people were as interested in architecture and as ready to talk about it as the ordinary people here were ready to talk about sport and theatres, and the American architect got more encouragement than did the English architect.

Mr. W. H. Ward
said he was much struck during a visit to the United States by the extent of the architectural progress there in the last few years. He agreed with Mr. Brewer as to the great hopefulness that there is for the future of American architecture, based chiefly on the immense efforts being made to educate the young architect and to give him a thoroughly sound grounding in all matters of design, and to teach them what is being done in Europe. What they were engaged on at present was working through the European styles and getting to know as much as was possible to know about them. One might hope that in the course of half a century or so a really national style would be evolved. It was interesting to observe all the different styles they had been trying and making experiments in. It was his impression that there was not any real or thorough understanding of the spirit of Gothic architecture, for the Gothic churches he saw did not impress him greatly, but he had not seen Mr. Cram's work. Some of the most interesting experiments in European styles were in the early Italian manner. The chapel of the Columbia University was a most charming building, chiefly in brick with a little marble and a considerable use of tiles.



Mr. J. M. Whitelaw
said he was struck by the intense zeal and earnestness and definiteness of aim and ideal in the American architects and the go-ahead character of their work. A high note was being struck in genuine art expression.

Mr. A. T. Bolton
said that what they had seen that night in the way of illustrations must have been a great revelation to many of them. It was very difficult in one country to form a proper idea of what was being done in another, and in judging the architecture of another country we were apt not to know who was doing the best work, and the fact took a long time to get round. Americans he had met showed a great interest in architecture and talked intellectually on the subject, but that was because they travelled largely, and, like English people who travel, they naturally took more interest in the buildings they saw abroad than those they had at home. They necessarily took an interest in the subject. The Americans were in a comparatively new country, but they had not kicked ancient architecture out of doors and derided the historical method; on the contrary, they seemed to have rather too much appreciation of it.

The Chairman,
in putting the vote of thanks, said he was rather surprised that more had not been said about the work of Richardson and Hunt, because he believed he was right in saying that they really founded modern American architecture, and they were both of them Englishmen.

The vote of thanks having been heartily agreed to,

Mr. Daubney,
in reply, said they had been hearing about two most important problems, *i.e.*, education and the rush of American work. He thought that the student and the architect in America exhausted himself at his work, but there were not so many limitations or cramping of that work. An architect here was tied up by money, convention, ancient lights, and things of that kind, but over there a man could exhaust himself on a subject, and could study for some specific object, such as a railway, a church, a big museum, but there was an absence of subtle features in building, such as could be found here, where one felt that the architect had been forced to study and grapple with the matter in order to get round some special difficulty. He was wondering if the architecture of America would really be advanced

War College, Washington.
Messrs McKim, Mead, & White, Architects.
(From a Photograph by Mr. Richard Philipp, Milwaukee.)

if there were to come a commercial catastrophe and the architect had to think out his problems more as we do.

Mr. C. C. Brewer
also replied, and said he met many American men who thought about their work and seemed a good deal keener than most Englishmen. All English architects who went to America—at all events, all he knew—were impressed by the vigour and fineness of the American ideals. The Americans were trying and were no mere hustlers; they were a race of keen, extraordinary well-trained men, and that training was altogether beyond what we had. It was difficult when an architect had perhaps a hundred assistants to say which was the work of A. and which that of B., but in the case of Messrs. McKim, Mead, & White, his idea was that, as Mr. Mackenzie had said, White was a curio hunter with very good taste, and had educated his clients and the public greatly in that way, but most of the finest buildings by the firm were, as far as one could get to know, by Mr. McKim, and he had a wonderful way of impressing everyone about him, very much as Mr. Norman Shaw did in this country. When Mr. McKim got interested in a work he gave up all else for it, and that note of keenness was characteristic of the American. He was certain that public interest in architecture was much greater in America than here—at least, it was more intelligent; people think about what modern architects are doing, they have a knowledge of architects' names, and they discuss the works of the big men in the way in which the works of painters are discussed here by people of the same class. Gothic work in America was poor, except in the cases of a few men who had thrown themselves into it with great interest. The work of Sulivan, of Chicago, was very thoughtful. As to Richardson, almost every town had some copy of Richardson, who, wonderful man that he was, had a sty which did not lend itself to copying, and h features had been copied with unfortuna results. Americans admitted he was a gre architect, but his work did not seem to le anywhere, and it got badly caricatured. The was an absence of muddle in American wor but they did not get the delightful details be seen in English work.

The President announced that the ne meeting will be held on March 25 (combin meeting with the Camera, Sketch, and Deba Club), when a paper by Mr. C. F. A. Voyse entitled "Patriotism in Architecture," will b read. The nomination of officers for Sessio 1912-13 will also take place.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the Londo County Council was held on Tuesday in th County Hall, Spring-gardens, S.W. Durin the opening of the meeting Sir Edward Whit occupied the chair, but retired after Captai G. Swinton had been elected Chairman fo the ensuing year.

KNIGHTHOOD.—A vote of congratulation proposed by Sir John Benn and seconded b Mr. Cyril Jackson, was accorded to Si Maurice Fitzmaurice, the Chief Engineer t the Council, on having been Knighted by th King on the occasion of the foundation stone laying of the new County Hall on Saturda last.

TOWN PLANNING OF DELHI.—Captain G Swinton reported to the Council that h should only be able to occupy the chair fo about four weeks, as he will be leaving fo India at the end of that time, having bee appointed one of the Committee for the tow planning of Delhi.

LOAN.—The Finance Committee recom mended and it was agreed to make a loa of 3,770*l.* to the St. Pancras Borough Counci for a housing scheme.

ALTERATIONS.—Various alterations are to b carried out at the Oldfield-road School, Hack ney, at an estimated cost of 160*l.*, and mino improvements at the Sidney-road School Hackney, at a cost of about 1,460*l.*

ALDWYCH.—The Improvements Committe reported that an offer had been received o 8,000*l.* a year for a lease of ninety-nine year for a part of Block R, Aldwych, and it i stated that it is proposed to erect an hotel o the site.

COMPETITION NEWS.

R.I.B.A. Prizes and Studentships.

The pamphlet of the Royal Institute an nouncing the subjects for the next competi tions for students has now been issued. Fo the first time the Essay Medal is offered for a treatise to be chosen by the author. The subject set for the Soane Medallion is "A Terminal Railway Station," for the Tite Prize "The Façade of a Royal Palace in a City," and for the Grissell Prize "A Riding School."

KING EDWARD MEMORIAL.

In the House of Commons, on the 5th inst. Colonel Burn asked the Hon. Member for the East Dorset Division, as representing the First Com missioner of Works, whether anything had been decided as to a site for the King Edward VII Memorial; and would an opportunity be given for a full discussion in the House before any thing was definitely settled.—Captain Guest, in reply, said: The Committee has recommended that the statue of King Edward VII. should be placed in the grass vista which leads from Piccadilly to the Queen Victoria Memorial. A model will be exhibited in the Tea Room as soon as it is completed. The question of dis cussion may perhaps be allowed to stand over until the model has been shown.—Earl Winterton: "Is there a chance of discussing the subject before the Committee's decision becomes binding on the country?"—Mr. Asquith: "Yes."—The Executive Committee of the King Edward Memorial Fund have approved, under certain conditions, the model sub mitted by Mr. Bertram Mackennal, A.R.A., and Mr. Edwin Lutyens for the statue of King Edward at the Piccadilly end of the Broad-walk.

THE ARCHITECTURAL ASSOCIATION:

FOURTH SPRING VISIT.

EXECUTED town-planning schemes in which ne designer has been alike responsible for he disposition and form of the buildings re sufficiently uncommon in England to lend particular interest to the Central-square t the Hampstead Garden Suburb, which vas visited by the Architectural Association n Saturday, March 2. The site—a level lateau some 500 ft. each way—is almost deal for its purpose, and the general scheme f laying-out adopted by Mr. Lutyens is a ne one. It consists of a square about 350 ft. cross, open to the west (from whence it is ommonly approached), facing which is the nstitute centrally placed on the east, the outh side closed by St. Jude's Church, and ne north by another church described as inter-denominational." Beyond these two hurches to the north and south on either ide of the square are other open "places," n shape long closed rectangles with approach oads centring with the transepts of the hurches. The houses surrounding both of hese squares and their approach roads are lso included in the scope of Mr. Lutyens' cheme, which thus creates the entire icture. Other roads from eastward centre rith the long axes of the two churches.

The buildings at present erected comprise ne north block of the Institute—to be alanced eventually by a corresponding nked block—St. Jude's Church with its icarage, the Free Church and its manse, nd the greater part of the buildings round ne north square and its approach road, rskine-hill. All are treated externally in milar materials and in a generally homo geneous manner as to detail. The bulk of the alling is faced with silver-grey thin bricks ith bright red dressings and a sparing use stone in cornices, bands, and entrances. he roofs are tiled. The massing and detail are stinctively Mr. Lutyens', leaning towards ne Wren manner of the Kensington rangery and Hampton Court Palace. Only ne public buildings were examined in detail y the members present, and in this they ere greatly assisted by the selection of the rchitect's drawings, which was kindly placed n view in the Institute, these showing, mong other things, the many points upon hich original intentions had been curtailed abandoned –as notably in the omission of clearstory from St. Jude's.

Unquestionably the most interesting of ne three buildings is the Church of St. Jude-n-the-Hill: helped by its lofty situation, ne fine mass of its central tower tells mirably from many distant points, and the mpletion of its spire will make it even ore striking. Externally the main build-g is little more than a very high pitched of rising almost from the ground, inter-cted by flush transepts of narrow span but ual ridge-height, and dominated by the fty central tower and spire. From the w eaves rise tall dormer windows lighting e aisles, the remaining light of the interior ing derived from large windows in the ansept ends, a temporary west window and clearstory on either side of the sanctuary, ove the lower Lady Chapel and vestries spectively to north and south. A note-orthy feature externally is the absence of utters and down pipes, the eaves dripping om a stone cornice into a paved channel und the wall base. The aisle walls are uilt hollow—a necessary precaution in such case. Internally a one-bay aisleless sanc-ary (eventually to be completed by an sidal east end) and the space under the wer are each covered by pendentive domes concrete plastered, with a ring of brick ussoirs marking off a saucer-dome above e pendentives. The aisled nave has a astered concrete barrel vault with brick ch-ribs. The main arcade is of brick, with fty plastered pilasters rising to a bold stone rnice in each bay, and the effect is very assive and dignified. Opinion may be vided, however, as to the expediency of e constructional jugglery of the aisle roofs, hich seem not only confused in appearance, t considerably out of harmony with the ld and simple scheme of the nave and nctuary. The roof timbers are of Oregon ne, sandblasted, and are very pleasant in colour and surface. The choir at present occupy temporary seats in the sanctuary, but the plans provide for their eventual transference to the west end, where, above a vestibule between the church and a projected meeting hall, the organ will also be situated. The pulpit, altar, and some other fittings are from Mr. Lutyens' designs.

The Free Church is so designed as to balance the opposite building, in a general way the transept fronts, aisle wall, and main roof being similar, shortened in the eastern limb by the curtailment of the chancel, the east end being encircled by a range of low buildings and the crossing surmounted by a tiled cupola on an octagonal brick drum, not sufficiently important to rank as more than a central feature or to make the effect that of a domed church. The design of the east end is very cleverly managed, particularly the frank disposal of the chimneys from the rooms below. Internally the construction is reinforced concrete, and the extreme tenuity permitted by this material produces an open effect totally at variance with that of the church. The aisles are divided by orthodox Roman Doric columns and entablature, formed in plaster on the concrete construction, a plain barrel-vault covering nave, chancel, and transept, and a hemispherical dome the crossing. The external cupola is built up of timber on a reinforced concrete cone 30 ft. 6 in. high, and a copper-covered lantern projects above. Both churches are at present disfigured by temporary west fronts, but it must be regarded as a matter for satisfaction that the central features—spire and dome—are being carried to completion; such features are in like case so often deferred and eventually abandoned.

FIRE PROTECTION IN PARIS.

THE British Fire Prevention Committee has issued a Report on the fire protective arrangements in Paris, the Report comprising an illustrated volume of some 110 pages, profusely illustrated from photographs, and having been prepared by a Special Commission, which included the Earl of Londesborough, K.C.V.O., Messrs. Edwin O. Sachs, F.R.S.Ed., Horace S. Folker, F.A.I., Ellis Marsland, District Surveyor, and others closely connected with the subject.

Besides giving a detailed record of what the Commission considered instructive, the Report is prefaced by a number of observations and impressions which should be of considerable importance to the fire protective work in this country, as also in the Colonies, the data being prepared in such a manner as to be of use to the various authorities concerned.

The Paris Fire Brigade Regiment is dealt with at considerable length. This brigade is fast becoming a motor fire brigade, and, being a military body conducted on modern lines, is remarkably well disciplined and of splendid physique. The fire preventive measures as to shops, warehouses, theatres, and tube railways are dealt with in detail. These excellent precautionary measures are mainly due to the initiative of the well-known police Prefect, Monsieur Lepine, whose mobile cyclist police squadrons are also illustrated, as also his river police, which is equipped with fire floats.

The National Fire Service, the Paris Suburban Fire Brigades, the fire precautions at great establishments outside Paris, like those of some of the great gasworks, are reported upon, as also the organisation of the French Fire Service Federation.

The whole subject is fully reviewed by the British Fire Prevention Committee with reference to both the national and local aspect, and the many illustrations are supplemented by a coloured map of Paris, and include as frontispiece the well-known picture illustrating the death of the late Colonel Froidevaux, of the Paris Brigade, at a great factory fire in 1882. We give an illustration, taken from the Report, of the trophy won by the Paris Fire Brigade in the National Inter-Regimental Gymnastic Competition of the French Army.

Trophy won by the Paris Fire Brigade.

ARCHITECTURAL SOCIETIES.

The Society of Architects.

The fifth ordinary meeting of the Society of Architects for the Session 1911-12 was held at No. 28, Bedford-square, W.C., on March 7.

Mr. Percy B. Tubbs, F.R.I.B.A. (Vice-President), presided, in the unavoidable absence of the President.

The ballot was taken, and the following candidates were declared to be duly elected:—

As Members.

E. O. Brown, Gravesend
A. E. Chasemore, London
P. R. Fincher, Penywern, Neath
W. J. Kemp, jun., Muswell-hill, N.
J. M. Miller, Montreal.

As Students.

W. Brooke, Cleckheaton
W. H. Rebbeck Frome
H. S. Clark, St. John's Wood, N.W.
R. H. Richardson, Wood Green, N
M. Evans, Kensington, Liverpool
C. S. Rhodes, Lytham
R. C. E. Griffiths, Bridgend
J. E. Sanders, Liverpool
F. C. Haslam, Grays
T. Scott, Lemington-on-Tyne
F. Holt, New Brighton
T. E. Turner, Hampstead, N.W.
W. H. Marley, Barry
A. Tutton, Gravesend
W. A. Miller, East Finchley

Mr. A. Alban H. Scott (member of Council) then read a paper on "The Testing of Materials for Reinforced Concrete," and a discussion followed. Our report will be given next week.

Devon and Exeter Architectural Society: Annual Meeting at Exeter.

The annual meeting of this Society, which embraces the counties of Devon and Cornwall, in alliance with the Royal Institute of British Architects, was held on the 9th inst. at the Half-Moon Hotel, Exeter, the President, Mr. James Jerman, F.R.I.B.A., of Exeter, being in the Chair, and among those present were—Messrs. J. M. Pinn, J. Crocker, J. A. Lucas, S. Dobell, B. H. Palmer, T. A. Andrews, L. Tonar, O. Ralling, A. Stevens, A. N. Tucker (Exeter), W. H. May, A. S. Parker, B. P. Shires, E. Coath-Adams, R. H. Arthur, H. Watts, C. H. L. Varcoe, B. W. S. S. Baily (Plymouth), and Allan J. Pinn, Hon. Secretary.

The annual Report was presented by the Hon. Secretary, and the balance-sheet was presented by the Hon. Treasurer (Mr. S. Dobell).

The retiring President, Mr. James Jerman, then delivered an address, an abstract of which appears on p. 313.

A cordial vote of thanks was proposed by Mr. B. P. Shires to the President for his address, and also for the able manner in which he had discharged the duties of his office during the past year. This was seconded by Mr. James Crocker and carried by acclamation.

The meeting proceeded to elect the officers for the ensuing year, as follows:—Mr. E. Coath-Adams, M.S.A. (Plymouth), President. Mr. J. A. Lucas, A.R.I.B.A. (Exeter), Vice-President. Messrs. J. M. Pinn, L. F. Tonar, T. A. Andrews (Exeter), R. H. Arthur (Plymouth) to fill vacancies on the Council of those retiring, as well as those remaining in office, viz., H. L. Thornely, F.R.I.B.A., Sampson Hill (Redruth), and the two Past-Presidents, Messrs. W. H. May, M.S.A. (Plymouth), and James Jerman, F.R.I.B.A. (Exeter). Mr. S. Dobell, Hon. Treasurer, and Mr. Allan J. Pinn, A.R.I.B.A., Hon Secretary.

The retiring President proposed a hearty vote of thanks to the Hon. Treasurer and Hon. Secretary for their services during the past year, and bore testimony to the very efficient manner in which they had carried on the business of the Society. This was carried by acclamation, and Messrs. Dobell and Pinn returned thanks for the further confidence reposed in them.

The newly-elected President, Mr. E. Coath-Adams, in taking the Chair, thanked the members for the honour they had done him, and felt sure that he should receive the support of the members and the able assistance of the Secretary in carrying out the duties of his office.

Mr. E. Coath-Adams then proposed a vote of thanks to the retiring President, Mr. James Jerman, which was seconded by Mr. S. Dobell and carried, to which Mr. Jerman replied, saying the great pleasure it had been to render any assistance to the Society, and that his duties had been lightened by the constant and ready help he had at all times received from the Hon. Secretary.

Subsequently the members lunched together, at which the toast of the King was followed by that of the healths of the President and Vice-President, and the President gave "Success to our Profession."

During the day the visiting members were shown the various points of interest in the City, under the guidance of the President, Mr. James Jerman, and amongst those visited were the Rougemont Grounds, Law Library, the Bishop's Palace, the Cathedral, College Hall, Guildhall, and several churches and mediæval buildings.

The thanks of the Society were expressed to those who had so kindly given permission for visiting the various buildings.

Aberdeen Architectural Association.

At a recent meeting of the Aberdeen Architectural Association Mr. J. A. Ogg Allan, architect, delivered a lecture on "The Educational Buildings of America." The lecturer limited himself to the description of the elementary and secondary schools of four cities—New York, Chicago, Boston, and St. Louis—want of time preventing him from describing the university and technical college buildings he had visited. In America there are diversities owing to condition of climate, etc., and there is no such uniform type as prevails in this country and in Germany, as every State has its own way of doing things, and controls its own educational affairs. In New York the problem to be solved is rendered more difficult owing to the value of building land, the city being built on the narrow tongue of land known as Manhattan Island. Some school sites have cost as much as 140,000*l.* and accommodation provided for as many as 4,000 pupils in one building. The site is usually on a lot facing two streets and bounded by buildings on the two sides. The plan is in the form of the letter H, and in the basement under the play yards are provided a large "anditorium" and an elaborately equipped gymnasium. The classrooms are arranged in the stories above, and ample staircase accommodation is provided. In Chicago a somewhat similar type prevails, but more room is available for sites, and lighting can be got from all sides. Boston has still larger sites, and there many small schools have been built in addition to larger buildings. St. Louis has still more available space, and the prevailing type is the "E" plan. The buildings are lower, consisting of two stories and basement, while the "auditorium" is omitted. Mr. Allan showed by means of lantern slides many plans of schools in these four cities, with photographic views of the exteriors and interiors, and he explained the details of arrangement and equipment, the latter being much better than in this country. Single desks for all pupils and shallow baths are provided, and there are such matters as electrically controlled clocks and telephones from the master's room, vacuum cleaners, etc.

Glasgow Institute of Architects.

The annual general meeting of the Glasgow Institute of Architects was held on the 6th inst. in the premises of the Institution of Engineers and Shipbuilders, 39, Elmbank-crescent, Mr. J. B. Wilson, the President, in the chair.

Mr. C. J. MacLean, the Secretary, submitted the forty-fourth annual Report. It stated that fourteen new members were admitted as Fellows during the year, and that sixteen new Associate members and three new student members were enrolled. The membership of the Institute now stood as follows:—113 Fellows, seventy-six Associates, thirty-two lay and twenty-two student members, giving a total of 243. During the past year the Council was actively engaged in formulating the scheme for the better regulation of competitions which has now been adopted by the Institute, and in terms of the new Articles of Association the following resolution was passed by the Council and approved of at a general meeting of Fellows and Associate members, viz.:—"Any Fellow or Associate member shall be considered to have been guilty of professional misconduct in terms of the Memorandum and Articles of Association of the Institute, and shall be liable to the penalties therein stated, if it be found by the Council either (1) that he has knowingly submitted, directly or indirectly, a design in any competition which has previously been the subject of a notice by the Council or by the Committee on Public Architecture and Competitions, prohibiting members of the Institute from taking part in the same; or (2) that he has knowingly solicited the promoters for permission to submit a design in a limited competition after the lect has been closed." The scheme which was put before the Institute after long and careful consideration by the Council is, the Report stated, similar to that of the Royal Institute, by which it has been approved. A like course of action has been adopted by several of the allied societies in their respective districts, and the Council is in communication with all those in Scotland toward securing similar procedure on their part where not already in force. The Council hopes under the powers now granted to it to be able to deal more effectively with the apparently increasing number of unsatisfactory competition
The Council had under consideration the pr
posal that the extension of the Municip
Buildings should be carried out by the Ci
Engineer's Department, and a letter protes
ing against this course of action was fe
warded to the Corporation. It was not
with satisfaction that the Corporation r
mitted the proposal back to the Committ
for reconsideration. The Council, the Repo
further stated, accorded its cordial suppo
to a proposal that an exhibition of the tow
planning drawings exhibited in London la
year, and more recently in such centres
Edinburgh and Dublin, should be held
Glasgow. In co-operation with the loc
branch of the Garden Cities and Town Pla
ning Association a letter was forwarded
the Town Council asking them to give th
proposal their support. A reply was receive
from the Town Clerk stating that the matt
had been remitted to a Sub Committee
consider as to inviting the exhibition
Glasgow at an early date. Recognising th
importance of the Scottish National Confe
ence on Housing and Town Planning A
ministration to be held in Glasgow on Marc
19 and 20 next, the Council has, on the inv
tation of the Standing Advisory Committ
of the Conference, appointed the whole
its members as delegates on behalf of th
Institute.

The Chairman proposed the adoption of th
Report. He referred to the recently inst
tuted Licentiate section of the Royal Inst
tute of British Architects, and said he w
pleased to say that the response from the
province had been very gratifying, and th
from what he personally saw during his ter
upon the Royal Institute Council, not onl
in numbers had the Glasgow Province bee
equal to any section of the kingdom, but
quality also. He said it was pleasant
know that the Town Council, awakened
last either by a sense of duty or emulatio
of other cities, proposed to encourage
assist a Town Planning Exhibition and Co
ference in Glasgow. The exhibition could b
but a shadow of what it might have been ha
they accepted the offer made them last yea
as the bulk of the best drawings were n
now available; but it was something to kno
that at last they recognised that town pla
ning had interests beyond these merely
architects and builders, and that it concerne
the municipality and the public most of al
The Corporation having seen the error
their ways in relation to this matter, the
might hope for better and saner procedur
in other civic matters which nearly concer
them as architects and in which they ha
recently ventured respectfully to enter the
protest. He referred, of course, to th
large and rapidly increasing amount of mun
cipal building work emanating from the Cit
Engineer's office. At present the A
Galleries, the rebuilding of the histori
Tontine, and the extension of the Municip
Buildings—work all calling for high archi
tectural skill—was being, and proposed to b
designed and controlled from an "Engineer
Department." Not only as ratepayers, i
the city's interest, but as architects, prou
of the architectural reputation of their city
they desired to show that the skill of th
past had not departed and that their publi
buildings should be worthy of them and o
the city to which they were proud to belong
Referring to the new regulations for com
petitions, he said these had been adopted b
the Institute and homologated by the Roya
Institute of British Architects, and h
trusted such public bodies, committees,
individuals who were proposing competition
would recognise that their desire was not t
be antagonistic but helpful.

Mr. Alexander N. Paterson seconded th
Report and financial statement, which wer
adopted.

The Council for the ensuing year wa
elected as follows:—Messrs. John B. Wilson
John Watson, J. K. Hunter, Alexander N
Paterson, W. G. Rowan, John Fairweather
Charles R. Mackintosh. Robert Wemyss
James Lochhead, James M. Monro, Georg
A. Paterson, Alexander M'Gibbon, Ninia
Macwhannell, James Lindsay, James H
Craigie, William B. Whitie, Alan G. Mac
Naughtan, and Alexander Wright.

The retiring President was heartil
thanked for his services in promoting th
interests of the Institute.

GENERAL NEWS.

Professional Announcements.

Mr. George H. Wenyon, architect, Castle ..ill, Dudley, has given up his practice at ..udley and Tipton, and is going abroad for ..is health. Messrs. Thompson & Warming..on, solicitors, Dudley, will receive any ..mmunications on his behalf.

The partnership hitherto existing between ..r. T. W. Haigh, architect and surveyor, ... Exchange-street East, Liverpool, and Mr. ..rnest S. Thompson has been dissolved as ..om November 24 last. Mr. Thompson ..tires from the practice, which will in future ..e carried on by Mr. T. W. Haigh under his ..wn name.

Mr. H. Guicharde Todd, F.S.A.(Scot.), ..S.A., architect and surveyor, has changed ..s address from 6, Cheapside, London, E.C., .. Southampton House, 317, High Holborn, ..C. His telephone number is Holborn 627.

The Mansions of England.

Mr. William Heinemann is issuing a fac..mile reprint of Joseph Nash's "The Man..ons of England in the Olden Time." The ..w edition, a large 4to as the original, ..ntains, in addition to the plates, a Preface ..y Mr. Reginald Blomfield, A.R.A.

Art Museums and Picture-Galleries.

Mr. Edwin T. Hall will read a paper on ..t museums and picture-galleries at the ..neral meeting of the Royal Institute of ..itish Architects, fixed for April 1. The ..ustrations will include a fine collection of ..des specially prepared for the paper. Mr. ..all's paper is in substitution of that on "Modern Methods of Construction," which ..r. Dunn is unable to read.

The Mural Painting Exhibition.

The committee of the forthcoming exhibi..n of Designs for Mural Paintings and for ..e Decoration of Schools, etc., have now ..ued a final circular containing full par..culars of the competitions offered to artists, ..d of the exhibits which it is hoped to ..cure. The Exhibition will be opened at ..rosby Hall, Chelsea, on Saturday, June 1, ..d a number of definite offers of wall-spaces ..be decorated, and of funds to bear the ..penses, have already been secured. The ..rculars will be sent to anyone interested ..application to the Hon. Secretaries, Mural ..ecoration Committee, Crosby Hall, S.W.

Petersfield Main Sewerage.

The Petersfield Urban District Council ..ve instructed Mr. Harry W. Taylor, ..M.Inst.C.E. (Messrs. Taylor & Wallin), ..ewcastle-upon-Tyne and Birmingham, to ..port upon improvements of the existing ..ain sewerage of the town.

The Photographic Survey of Surrey.

From the ninth annual Report for 1910 of ..e Council of the Photographic Survey and ..cord of Surrey we learn that during the ..st year 482 photographs have been received ..d recorded, this being a decrease of 108 ..1909. The photographs received are ..assified as follows :—Architecture, 177; Art ..d Literature, 235; Anthropology and An..quities, 11; Geology, 1; Natural History, ..Topography and Passing Events, 57. ..otal brought forward from last Report, ..293. As to the architectural prints contri..ted, they include Chertsey, Frensham, and ..urt, and the district around Godalming ..s received attention by a member who has ..t in twenty-six prints from this neigh..urhood. Besides these, prints have been ..ceived of streets in old Croydon, of Farn..m, Tadworth, Walton-on-the-Hill, Walton-..-Thames, Nutfield, Godstone, Bletchingly, ..dhill, Thursley, Hindhead, Compton, ..ngfield, Epsom, and Pirbright.

mmons and Footpaths Preservation Society.

Lord Eversley presided over the monthly ..eting of the Commons and Footpaths Pre..rvation Society held at 25, Victoria-street, ..W. A letter was read from Sir T. Fowell ..xton and Mr. E. N. Buxton forwarding a ..ntribution of 200 guineas in celebration of ..eir golden weddings and in commemoration ..their forty-seven years' connexion with the ..ciety. The solicitor, Mr. Percival Birkett, ..ported that the Bill of the Metropolitan Railway Company had now been amended so that the proposed new line from Rickmansworth to Watford would stop short of Cassiobury Park, instead of bisecting that open space. It was also stated that negotiations were taking place in regard to the provisions of the West Ham Corporation Bill, under which 4 acres of Wanstead Flats will be taken. It was decided to oppose the Woking District Gas Bill, under which 4½ acres of Horsell Common would be enclosed. It was reported that the National Trust had agreed to take up the Society's scheme for the purchase, for 1,250*l.*, of the manorial interests in Minchinhampton Common, Glos., over 600 acres in extent. The purchase fund already amounted to 620*l.*

International Smoke Abatement Exhibition.

Particulars have now been issued of the arrangements in connexion with the Conferences of Delegates of Municipal Authorities and other bodies to be held at the Royal Agricultural Hall in connexion with the International Smoke Abatement Exhibition. The Conferences will take place on the 26th, 27th, and 28th inst., the respective Chairmen being Sir William Ramsay, K.C.B., F.R.S. (President British Association); Sir William Richmond, K.C.B., R.A.; and Lord Justice Fletcher Moulton. The Conferences are divided into three sections to consider: (*a*) Smoke Pollution and its Effects; (*b*) Smoke Abatement; and (*c*) Law and Legislation. Amongst the numerous papers to be considered are those on "The Action of Coal Smoke on Building Stones and Mural Paintings" (Sir Arthur Church, K.C.V.O., F.R.S.); "The Effects of Town Air on Metalwork" (Dr. S. Rideal, D.Sc., F.I.C.); "The Economic Aspect of Smoke Abatement" (Dr. R. Lessing, Ph.D., F.C.S.); "Inference of Smoke on Pigments" (Mr. Noel Heaton); "Kew Gardens and Smoke" (Mr. W. J. Bean, Assistant Curator, Kew Gardens); "Should the Domestic Smoke Nuisance be Any Longer Tolerated?" (Bailie W. Smith, of Glasgow); "The Smoke Problem in the U.S.A." (Mr. Z. A. Willard, of Boston); "Smoke Abatement Laws in Other Countries" (Mr. Julian S. Corbett, LL.M.); "Is Further Legislation Necessary?" (Mr. Joseph Hurst, Barrister-at-Law); "The Proposed Smoke Abatement Bill" (Principal J. W. Graham); "A Plea for the Appointment of a Royal Commission" (Dr. H. A. Des Voeux, Treasurer, Coal Smoke Abatement Society). In addition to the papers special lectures are being organised on the different phases of the Smoke Abatement Movement.

Geology of Tavistock.

The Board of Agriculture and Fisheries desire to give notice of the publication of a new colour-printed Sheet No. 337 of the Geological Survey map on the 1-in. scale, and, in explanation of the map, a Memoir of the Geological Survey on the Geology of the Country around Tavistock and Launceston. This memoir describes the geology of the area covered by the 1-in. colour-printed map Sheet 337, including part of Bodmin Moor and the country around Tavistock and Launceston. After an Introductory Chapter, Chapters II. and III. are devoted to the Devonian and carboniferous rocks; Chapter IV. describes the igneous rocks earlier than the granite intrusion; Chapters V. and VI. deal with the granite and its surrounding aureole of metamorphism; Chapter VII. relates to the Drift, and Chapter VIII. to Economics. The memoir is illustrated by two plates of geological structures, and one of photomicrographs. Copies may be obtained from any agents for the sale of Ordnance Survey Maps, or, through any bookseller, from Mr. T. Fisher Unwin, 1, Adelphi-terrace, London, W.C. The price of the map is 1s. 6d., and the memoir, 3s.

Cambridge University.

The Sites Syndicate have recommended that for the increased accommodation required by the School of Agriculture an extension should be made, westwards, of the present building, near Tennis Court-road, and that for the Forestry Department a site should be allotted in the south-eastern portion of the ground bought from Downing College. Mr. Bruce Joy designed the memorial which is being erected in Jesus College Chapel to Thomas Cranmer, who was a Fellow of the College.

THE NEW COUNTY HALL.

THE King and Queen, accompanied by the Prince of Wales and Princess Mary, visited the site of the new County Hall at Westminster Bridge on Saturday last, when his Majesty laid the foundation-stone of the building. As the result of open competition, Mr. Ralph Knott's design for the new building was declared to be the most suitable, and in 1909 a start was made with the construction of the embankment wall. The wall was successfully completed by September, 1910, at a total cost of 58,000*l.* The plan of the principal floor of the new County Hall indicates a building 750 ft. long with an average width of 310 ft. The building is to consist of nine stories, of which the two lowest, being below the road level, will be utilised for storage purposes. The principal floor will be mainly devoted to the Council Chamber, lobbies, and committee-rooms, but there will also be accommodation for chief officers whose duties necessitate close attendance upon the Council's committees. The remaining floors will be allocated to the staffs of the various departments. The Council Chamber will be 3,500 sq. ft. in area and 55 ft. in height, with galleries for the accommodation of the Press and public. On that portion of the site which is to be built on at present accommodation is provided for a staff of 2,270.

The external elevations of the frontages to the river, to Westminster Bridge-road, and to Belvedere-road will be of Portland stone on a base of granite. The scheme as originally approved by the Council was estimated to cost 1,706,000*l.*, but it has now been decided to exclude the site of Messrs. Holloway's premises from the scheme. The estimated cost is accordingly reduced to 1,412,000*l.* The building has been designed and planned by the selected architect, Mr. Ralph Knott, in collaboration with the County Council's official architect, Mr. W. E. Riley, and the embankment wall was designed by the Council's Chief Engineer, Sir Maurice Fitzmaurice.

Illustrations of the building have appeared in the *Builder* for February 8 and 15, 1908; August 1, 1908; September 10, 1910.

In connexion with the ceremony of laying the foundation-stone of the new County Hall, the following gentlemen had the honour of being presented to their Majesties :—The Chairmen of the General Purposes Committee and the Establishment Committee, the Architects of the Building and the Council, the Chief Engineer and the Valuer. At the conclusion of the ceremony the King and Queen were conducted to the Withdrawing Room, where the Chairman of the Council presented to their Majesties copies (specially bound in covers made by students at the Council's Central School of Arts and Crafts) of a descriptive account of the New Hall, after which the King and Queen signed the Council's record. The King conferred the honour of Knighthood upon Mr. Edward White and Mr. Maurice Fitzmaurice.

FIFTY YEARS AGO.

From the *Builder* of March 15, 1862.

The Cost of Soot.

IN connexion with the British and Indian Army estimates, an honourable Member called attention lately in the House of Commons to a charge of 5,891*l.* for sweeping chimneys. If it cost such a large sum for the clearing of the chimneys of the offices, barracks, etc., connected with our Army, how great must be that of sweeping all the chimneys in the British Empire? If this sum may be taken as affording something like a scale for the amount expended for chimney-sweeping by the British population who use chimneys, the annual charge would amount to nearly a million sterling. This sum, large as it is, is probably not over the mark, if we remember in the metropolis alone how many houses there are of which every room is inhabited. And how much are we to add as the cost of fuel which is wasted in the formation of all this soot? Various improvements have been made of late in the construction of fireplaces in both manufactories and dwellings; notwithstanding, great would be the public benefactor who would provide us with a sure means of economically consuming the chimney smoke.

EDITORIAL SUMMARY.

In our leading article, "Why Employ Architects?" we deal with several aspects of the question.

An illustrated article on "A Florentine Palace" (p. 290) deals with the Palazzo Davanzati.

In "Notes" columns (p. 291) will be found observations on: "The Preservation of Ancient Monuments"; "Combined Heating and Power Plant"; "Lambeth Bridge"; "The Associates and the R.I.B.A."; "The Improvement of London"; "The New Indian Capital."

A meeting of the Architectural Association was held on Monday, when papers were read on "American Architecture" (see p. 292).

A report of the Fourth Spring Visit of the Architectural Association, to the Central Square at the Hampstead Garden Suburb, is given on p. 297.

Brief reports of meetings of the following Architectural Societies are given on p. 297: "Glasgow Institute of Architects"; "Aberdeen Architectural Association"; "Devon and Exeter Architectural Society"; "Society of Architects."

In Correspondence columns (p. 300) will be found letters on: "Trade Unionism and Restraint of Trade"; "Padbury *v.* Holliday, Ltd."

The Monthly Illustrated Historical Review (p. 301) includes: "The Architecture of Portugal"—I.; "The English House from the Normans to the Tudors"; and "Notes."

The Building Trade Section (p. 306) includes: "The Manchester Building Trades Exhibition"; "London Association of Master Decorators"; "Projected New Buildings in the Provinces"; "Applications under the London Building Acts."

An abstract of the sixth Carpenters' Hall Lecture, by Mr. M. H. Baillie Scott, on "House Building, Past and Present," appears on p. 310.

"Form and Vision in Reference to Art" was the title of a recent lecture at Carpenters' Hall, an abstract of which appears on p. 311.

An abstract of a paper on "Church Restoration" is given on p. 312.

On p. 313 some notes from the Presidential Address of Mr. James Jerman before the Devon and Exeter Architectural Society are given.

In our Law Report columns on p. 314 is given: "Pratt & Co., Ltd. *v.* W. F. Frith."

MEETINGS.

FRIDAY, MARCH 15.

Institution of Mechanical Engineers.—Dr. Rudolf Diesel on "The Diesel Oil Engine." 8 p.m.

Royal Sanitary Institute.—Mr. H. Phillips Fletcher on "Ventilation, Warming, and Lighting." 7 p.m.

Glasgow Architectural Craftsmen's Society (Technical College).—Mr. A. H. Purdie on "Some Practical Considerations on the Measuring and Valuing of Mason and Brickwork."

South-Western Polytechnic Institute, Chelsea.—Sir David Gill, K.C.B., F.R.S., will present prizes and certificates to students of Evening Classes and Day College. 8 p.m. (Laboratories and workshops open to public inspection at 9.15 p.m.)

SATURDAY, MARCH 16.

Architectural Association.—Fifth Spring Visit, to King's College Hospital, Denmark-hill. Meet at the building, 3 p.m.

The Royal Institution.—Professor Sir J. J. Thomson, M.A., LL.D., D.Sc., F.R.S., on "Molecular Physics"—(IV). 3 p.m.

MONDAY, MARCH 18.

Royal Institute of British Architects.—Mr. W. H. Ward, M.A., on "The Architecture of the French Renaissance." 8 p.m.

Royal Society of Arts.—Mr. Noel Heaton, B.Sc. F.C.S., on "Materials and Methods of Decorative Painting"—(I). 8 p.m.

Royal Sanitary Institute.—Mr. W. E. Fretwell on "Details of Plumbers' Work." 7 p.m.

Liverpool Architectural Society (Incorporated).—Mr. J. Hubert Worthington, M.A., on "The Inspiration of Florence." 6 p.m.

Institute of Sanitary Engineers (Caxton Hall, Westminster).—Mr. Fraser on "The Modern Home." 8.15 p.m.

TUESDAY, MARCH 19.

Northampton Polytechnic Institute (Illuminating Engineering).—Mr. W. E. Goodenough on "The Practical Use of Gas Lamps." 7.30 p.m.

The Illuminating Engineering Society (Royal Society of Arts, John-street, Adelphi).—Papers on the "Lighting of Printing Works and Offices" will be read by Mr. F. W. Goodenough (Gas Light and Coke Company), and Mr. Justus Eck (Union Electric Company). 8 p.m.

The Institution of Civil Engineers.—Papers on "The Main Drainage of Glasgow," by Messrs. A. B. McDonald and G. M. Taylor, MM.Inst.C.E.; "The Construction of the Glasgow Main Drainage Works," by Mr. W. C. Easton, B.Sc., M.Inst.C.E.; "Glasgow Main Drainage. The Mechanical Equipment of the Western Works and of the Kinning Park Pumping Station," by Mr. D. H. Morton, M.Inst.C.E. 8 p.m.

WEDNESDAY, MARCH 20.

Carpenters' Hall, London-wall (Lectures on Arts Connected with Building).—Mr. W. R. Hoare on "The Craft of the Brick and Tile Maker." 7.45 p.m.

Edinburgh Architectural Association.—Mr. J. Campbell Mitchell, A.R.S.A., on "The Study of Nature by the Student of Decorative Art." 8 p.m.

Royal Sanitary Institute.—Mr. Henry C. Adams, Assoc.M.Inst.C.E., on "Sewerage." 7 p.m.

Northern Architectural Association.—Annual meeting. 7.30 p.m.

THURSDAY, MARCH 21.

Carpenters' Hall, London-wall.—Professor Wm. Somerville, M.A., D.Sc., on "The Forests of North America." 8 p.m.

Society of Antiquaries. 8 p.m.

The Institution of Electrical Engineers. Discussion, to be opened by Mr. S. Z. de Ferranti, President, on the following subject: "The Causes Preventing the More General Use of Electricity for Domestic Purposes." 8 p.m.

FRIDAY, MARCH 22.

Royal Sanitary Institute.—Mr. Henry C. Adams, Assoc.M.Inst.C.E., on "Sewage Disposal." 7 p.m.

Leicester and Leicestershire Society of Architects (Students' Evening).—Introduction to discussion on the R.I.B.A. Report on Reinforced Concrete, by Mr. W. Keay, A.M.Inst.C.E.

Aberdeen Architectural Association.—Mr. A. N. Paterson, M.A., A.R.S.A., on "French Influence on Scottish Architecture." 7.30 p.m.

BOOK RECEIVED.

SMALL WATER SUPPLIES. By F. Noel Taylor. (London: B. T. Batsford. 6s. net.)

CORRESPONDENCE.

Trade Unionism and Restraint of Trade.

SIR,—I brought the letter published by you in your issue of February 23 last before my Council, and the happy experience of the writer was warmly extolled as "lovely and innocent." The paradise of exemption and industry in which "X." has dwelt was the envy of everyone present. His ignorance is touching. That there is no society rule limiting the amount of work to be done by workmen is admitted, but the unwritten law as to the practice has been materially and expensively brought home time after time to every builder I have ever met. It is difficult to take "X.'s" letter seriously. He cannot be an employer at all or he would realise the absurdity of his letter.

THE INSTITUTE OF BUILDERS.
Kingsway, London.

East Sussex Hospital Competition.

A copy of the following letter to the Editor of the *Hospital* has been sent to us:—

SIR,—You have been good enough to forward me a marked copy of last week's issue of the *Hospital*, in which attention is particularly drawn to some criticisms upon the award of this competition and reflections upon the system of judging generally.

The jury system which appears so desirable to you has been under consideration for many years by architects who are most intimately concerned in the matter. It has also been tried on more than one notable occasion, but the results have scarcely been such as to recommend it.

The whole system of competition is open to grave objection, although it must be acknowledged that it has some redeeming features. I venture to think, however, the pros and cons of a purely architectural question such as this is scarcely likely to be of interest to the majority of your readers. Neither is it necessary to trespass upon the space you may be good enough to allow me by dealing point by point with your correspondents' criticisms, which are so easy to make. They will be convincing to no one but such of the unsuccessful competitors who lack the instinct of true sportsmen.

I except one point, which, if left uncontradicted, may receive a certain amount of general credence. It is such a common grievance in competitions. Your correspondents respectively state that:—

"The Committee fixed the sum of 35,000 (roughly, 350*l.* per bed) as the total cost for an up-to-date hospital, and the cost was stipulated as being an essential in the selection, 35,000 being the sum the Committee would have available."

The best answer to these misleading statements is to quote the actual condition, which was as follows, viz.:—

"The Committee think that 35,000*l.* is the maximum that they will have at their disposal for the whole hospital, and while they require the hospital to be up to date in all particulars preference will be given to a design within this sum if possible, but competitors must use their discretion in designing if they think that amount insufficient."

No honest reading of this clause suggests that the question of cost was essential.

For the rest, no good award is ever made in consideration of one or two points, but on a general survey of the design from every point of view. In other words, the best design is that which combines the greatest number of good points and the least number of errors; and as to these, an assessor who has given many hours to the study of the plans must be a better judge than your anonymous F.R.I.B.A.'s. By the way, I would be interesting to have their names, and especially to know if either of them competed.

The assessor's character and his work as a hospital architect are too well known to be questioned, and your correspondents' criticisms will probably cause him more amusement than annoyance.

I should like to take the opportunity of correcting a wrong but somewhat general impression. The authors of the successful design are my brother, Mr. John Saxon Snell, and Mr. Stanley M. Spoor, some time my pupil, not your humble servant.

Of the merits of their design it does not become me to speak, but I think no unprejudiced critic will dispute its general excellence.

A. SAXON SNELL.

Padbury *v.* Holliday, Ltd.

SIR,—"Sub-Contractor's" reply to my letter, while agreeing to the necessity of having a proper contract between builder and sub-contractor, branches off into a side issue, in which he depreciates the builder and points out the vast improvements in building work consequent upon the initiative of sub-contractors.

However, the object in my original letter was in reference to the necessity of a sub-contractors' agreement, and I do not propose to make any comment on your correspondent's remarks, which have no bearing on the subject.

I quite agree with his ideas that the agreement adopted should be a fair one, and that the original contract should form the basis of the agreement, and I venture to think it would be to the interests of architects, builders, and sub-contractors if the latter did, as your correspondent suggests, form an association. Then, and then only, would the builder avoid the controversy there invariably is with independent firms of sub-contractors as to whether they should accept their own responsibilities or pass them on to the already overburdened builder.

F. J. GAYER

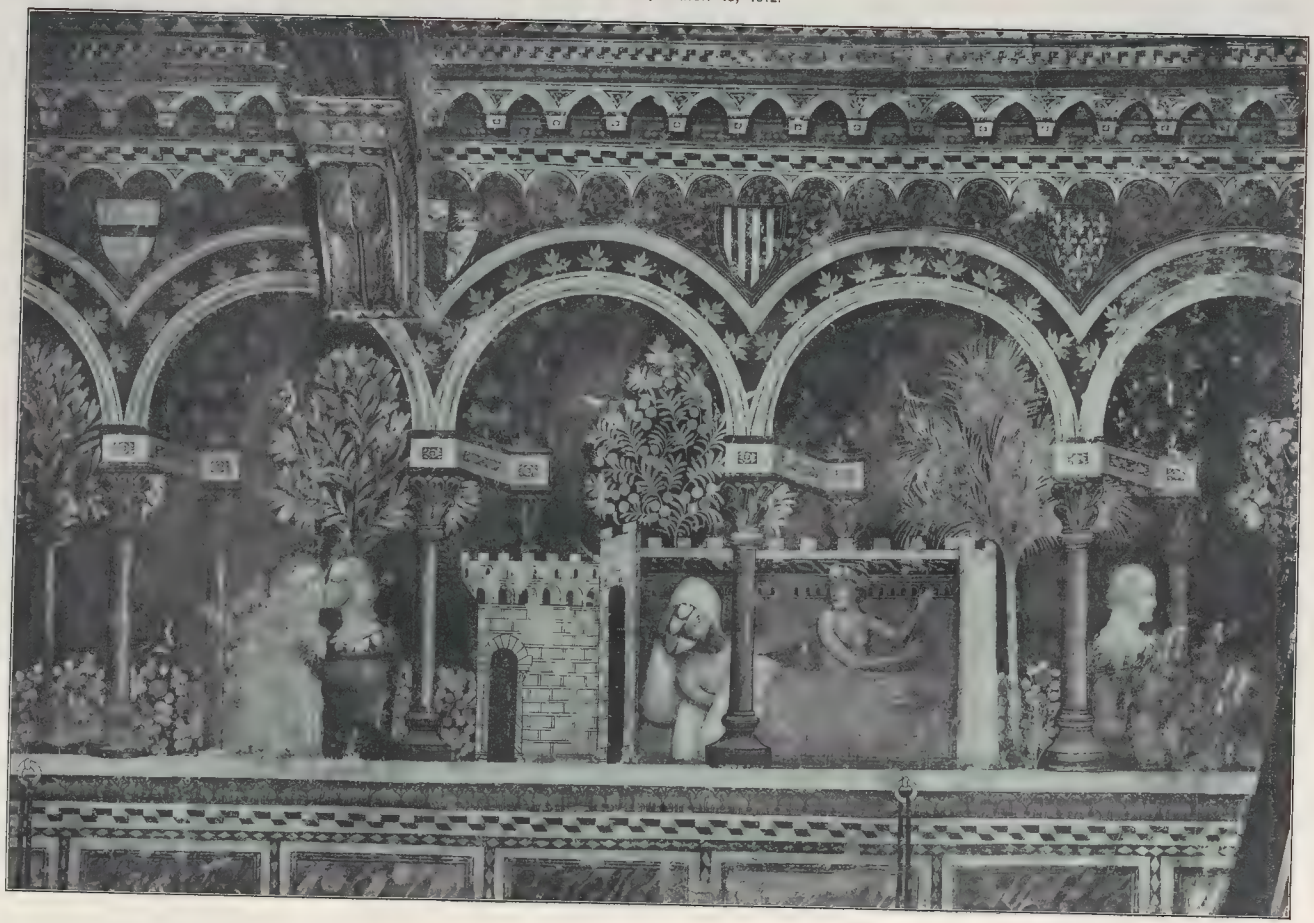
New Church of St. Luke, West Hartlepool.

THIS is the successful design in a limited competition in which Mr. W. D. Caröe was assessor. The strictest economy had to be studied, and the conditions required the building to be of stone. The cost will be 6,000*l.* exclusive of top of tower. The walls externally are to be faced with local rubble walling, and internally with plaster, while the stone dressings will be in Carlton or other local sandstone.



It is owing to the shape of the site, which is situated at the corner of Hart-lane and Tunstall-avenue, that the plan is rather wide in proportion.

Fig. 1. Old Cathedral of Coimbra before Restoration.

THE ARCHITECTURE OF PORTUGAL.—I.

PORTUGAL sits apart from her sister nations—

"A 'ewelled coronet gracing Europe s brow,
Where fails the land and ocean's realm begins,"

er own Camoens has sung of her.

ccessible only by sea or through the broad itories of Spain, herself a country relatively e travelled in, she has till recent years been of the last corners of Europe that the ist, casting about for fresh realms to quer, would hit upon as the scene of a day. This was especially the case with architectural student. It was considered cely worth while facing the comparatively ter difficulties of reaching such a destina-, since it was suspected that there was little the journey's end to reward the intrepid lorer. So little known, indeed, was the itecture of Portugal, so scarce the means nformation on the subject half a century ago, Fergusson was obliged to confess his bility to do more than touch upon one or of the best-known monuments, and these dismisses rather disparagingly. Since his things have greatly altered. Portugal has me of easier access. Lisbon is reached in fort to the seaworthy at least—by several mship lines in two and a half or three days Southampton, and the Republic possesses od, if not very rapid, railway system, so that holiday of, say, three weeks or a month the cipal points of architectural interest can be ed. Again, the literature of the subject considerably increased. Not only has the itable German *savant* written on the ect (cf., for instance, C. Uhde s "Baudenk-er in Spanien und Portugal," 1892, A. pt's "Baukunst der Renaissance in ugal," 1890-5), but Portuguese students e investigated many dark corners of their art history. More recently our country-, Mr. Crum Watson, in his "Portuguese itecture" (A. Constable & Co., 1908), has ned up the results of such previous research of his own study of the monuments on the spot. The above-mentioned works, supplemented by a visit of the writer to the principal places described, form the basis of these articles.

The great currents of the world's art have ever been associated with the history of dominant races or mighty movements in human thought and activity, and it is necessarily these main currents which afford the most fruitful field for study. But the art of remoter regions and minor nationalities to whom it has not been given to shake the world by force of arms or ideas need not, therefore, be neglected. An occasional trip can be profitably and pleasantly made to explore such subsidiary channels fed by the mingled filterings from mightier streams, where if the current sets with less vehemence and certainty in any given direction its very hesitations are charming. In a country like Portugal, which, in spite of its small size and population, has had no mean share in shaping the world's destinies, we may look for works not devoid of attractiveness.

Professor Carl Justi, in the historical sketch of Spanish art prefaced to Baedeker's "Guide to Spain and Portugal" (1908), says, "Sometimes it would almost seem as if all the schools of Europe had given each other a rendezvous in Spain at the expense of the Spanish purse." The remark is equally applicable to Portugal and her architecture. For the greater part of its history there is a strange lack of the distinctive marks of a national style; and, at the one period at which some such marks appear, the style in which they occur is neither thoroughly homogeneous, nor even exclusively national, since for a short period at least Spain offers here and there examples of "Manoelino" architecture, Portugal's most characteristic product, or something very analogous to it. Portuguese architecture is throughout merely one of the several provincial variants of the rather vague and composite type evolved in the whole Iberian peninsula under very varied foreign influences. Endowed with something of the Spaniard's strong decorative feeling and love of splendid architecture, the Portuguese, like them, lacked the grip necessary to make thoroughly their own what they borrowed from France, or Flanders, or Italy. They followed in the wake of the nations they imitated, often lagging as much as half a century behind them, and never assimilating their borrowings sufficiently to establish the elements of an independent evolution. Thus each new fashion abroad was in turn followed and in turn abandoned.

It would be too much to say, however, that the Portuguese showed no originality. Their copyings are not slavish, and they usually knew how to impart a flavour to their essays in foreign styles, which effectually and agreeably differentiate them from their prototypes, while in certain directions they attained results which surpass anything to be found elsewhere. This distinctive flavour is perhaps in some measure the result of the Oriental strain which, in view of their national history, was a necessary element in their civilisation. For while the young nation whose very existence was bound up with the profession of the Christian faith naturally turned to other Christian nations more advanced in culture for models of Christian architecture, and borrowed their architects to design important edifices, it was inevitable that skilled handicraft, when required in any quantity, should be supplied by the non-Christian but more highly-civilised population resident in its midst, the Moorish population which had been its master and which it was then engaged in subduing.

If the pedigree of Portuguese architecture cannot be traced like that of Italy or France in a direct line from that of Rome it is because the events which followed the break up of the Empire severed the country completely from its past. The deepest trace left by Roman rule which lasted for over four centuries is to be found in the language. If extant Roman monuments are few, they include in their so-called Temple of Diana at Evora the best-preserved Roman building in the peninsula.

The Vandals and Sueves who overran Lusitania and the adjacent provinces were not builders, and left no visible trace of their passage, and much the same accounts must be given of the Gothic rulers who followed them, though their civilisation, as manifested, for instance, by the jewellery from Toledo in the Cluny Museum in Paris, was of a relatively high order. Early in the VIIIth century the Mohammedan invasion from Morocco swept over the whole peninsula, and subdued all but its north-western mountain districts, which thus provided the starting-point of the later Christian reconquest. Meanwhile the invading "Moors," who consisted partly of Berbers and partly of Arabs, established themselves firmly in the conquered lands and practised all the arts accompanying a refined and luxurious civilisation. Although their rule extended over a period varying from one to five centuries in different parts of the country, their extant buildings anterior to the Christian reconquest are exceedingly few, two or three at the most, the best known of which is the so-called "Castello dos Mouros," on the rocky height above Cintra. This, however, is no measure of the influence of the Moors, which may be traced in several directions in Portuguese architecture even long after the final expulsion of the Moriscos, their Christianised descendants, in the XVIth century. For centuries after the reconquest, Moorish craftsmen were extensively employed and, even subsequent to their conversion to Christianity, the Moriscos retained their national traditions. Thus, while Portugal can show nothing to compare for splendour with the Alhambra of Granada, the Alcazar of Seville, or the Mosque of Cordoba, it boasts a series of buildings of some importance erected by Moors, though not for Moors, and retains some of their building methods to the present day.

By far the most important of these is the old Palace of Cintra, occupied till the recent revolution as a summer residence by Queen Maria Pia, and now maintained as a State Museum. Some sort of castle existed on the site at least as far back as the XIth century; but nothing now standing is recognisably older than the reign of John I. at the end of the XIVth. Yet there is a decidedly eastern look about this older part of the palace, which was much added to a century later by Manuel I., and it offers examples of practically all the characteristics which mark Moorish art in Portugal and which exerted an influence on the architecture of the kingdom.

The plan, as is so often the case in Oriental building, shows no attempt at order, symmetry, or parallelism. The masonry of the older walls, where the plaster has been removed for it to be examined, proves to have been of rubble strengthened at intervals in the Arab manner with lacing courses of thin bricks laid three deep. The elevations are mostly crowned by the Moorish type of battlement and pierced by Moorish windows. In the former the merlons are in steps shaped like the teeth of a saw; the latter each consist of two arches enclosed in a rectangular moulded stone frame. The arched heads, which are usually stilted and cusped, spring from slender shafts with capitals of a type familiar at the Alhambra, and abaci moulded at the sides but not on the face. Similar windows of Moorish type are found with horseshoe arches in the castle at Alvito, and a late doorway of like design, with horseshoe arches and spiral shafts, in the Chapter House of St. John the Evangelist at Evora. When there is cusping it starts at the base with a whole lobe not a half lobe as in occidental work.

At a distance the most striking feature of the old Palace of Cintra is the pair of gigantic cones which rise above its roof, recalling vaguely the oast houses of Kent, and serve the purpose of carrying off the fumes of the charcoal fires in the kitchen. Similar chimneys are still found in Morocco, and all visitors to Alcobaça will remember the remarkable XVIIth century example there, which rises from eight cast-iron columns in the centre of the kitchen of the monastery to a height of between 40 ft. and 50 ft. Unlike the chimneys of Cintra, however, it is rectangular in plan and not visible externally. This kitchen is further remarkable in being lined and paved with marble and fitted with huge marble tanks for sinks, which are fed by a clear mountain stream, running in a channel in the floor.

In examples of glazed tile linings and enriched wooden ceilings, two forms of decoration which play a large part in Portuguese architecture, and are both of Moorish introduction, the old Palace of Cintra is peculiarly rich.

The manufacture of coloured glazed tiles in the east is almost as old as history. They were introduced into Spain by the Arabs possibly as early as the VIIIth century, but no known examples can be proved to be earlier than the XIIIth. The cool expanses of wall and floor surface which they provided, so grateful in the torrid heats of summer, as well as their decorative qualities, soon earned for them a widespread popularity in the peninsula, which they have ever since retained. The earliest form in which they appear is that of self-coloured tiles limited to four shades—bluish-green, brown, dark violet, and milky white—of various shapes and laid in geometrical patterns. Later on the invention of a process similar to that of *cloisonné* work permitted of single tiles receiving a pattern. This was impressed on the damp clay, leaving slightly raised divisions. The patterns used in mediæval times were almost exclusively geometrical, especially the star or aster pattern, dear to Arab art, but grotesque animals and floral motives were also sometimes introduced. At Cintra are several rooms decorated with mosaics of self-coloured tiles, forming high dadoes with richly cusped and crocketed crestings and patterned borders. In others the field of the dado is made of tiles with vine leaves and bunches of grapes embossed and coloured. The old cathedral at Coimbra before restoration was clothed externally with richly-patterned tiles (Fig. 1). At the Renaissance the star patterns gave place to scroll ornaments and arabesques, and the range of colour became more varied, the subjects being

Fig. 2. "Hall of Shields" in the Old Palace at Cintra.

painted on a white ground without bounding ridges. A fine example of this kind of work is to be seen in the open ambulatory of the circular church of São Amaro at Alcantara, where large subjects are enclosed in architectural framework; in the Sacristy of Santa Cruz at Coimbra, and in the Marvilla at Santarem, where the whole walls are covered with a continuous pattern producing the effect of a rich tapestry. The use of lustre tiles, imitated from lustre ware, first light gold and later red gold, also came into vogue in the XVIth century. After the expulsion of the Moors the art of the tile-maker gradually declined. The colours lost in brilliancy, and their range became restricted, till a white ground with designs in blue, varied occasionally by yellows and purples, came to be the almost exclusive treatment.

This blue and white technique, which appears to have arisen almost simultaneously at Delft, was in each case the outcome of a desire to imitate Chinese porcelain, then becoming known in Europe. The use of large bordered panels, to complete which a large number of tiles might be required, came in in the XVIth century, and continued in use till the early XIXth, having reached its zenith in the XVIIIth. Innumerable examples of this system of decoration are to be found throughout the country. The cloisters of the Cathedral of Oporto afford an instance. Here the walls are decorated with a series of panels illustrating, in the lower story, the Song of Songs, and, in the upper, hunting, fishing, and other sports. Another is to be found in the Chapel of our Lady of the Desert in the monastery at Alcobaça, where the scenes are drawn from the Apocalypse. Side by side with these tiles, with a single design on each, a flower, a vase, or a figure, a scene similar to contemporary Dutch work, are commonly used, as, for instance, on the cloister staircase of Santa Cruz at Coimbra.

The modern use of tiles for covering entire façades does not date back beyond the XIXth century. Previously they were used for the walls of rooms, cloisters, and loggias, for dadoes, for the risers and treads of stairs. In gardens they served to line stone seats and the sides of tanks and fountains, as in the charming Quinta de Santa Cruz at Coimbra, and formerly in the cloister at Belem, which was laid out in the XVth century in a stellar plan, with a tiled tank dotted with islands connected up by bridges. One other external use was found for them in early times in the covering of domes and conical roofs. Thus the great chimneys at Cintra were once, and the dome of the Sé Velha at Coimbra and the spire at Evora are still, covered with green and white tiles laid in patterns.

The decorative joinery of the Moorish workmen, especially as applied to roofs and ceilings, likewise had a lasting influence on Portuguese architecture. It was their custom to enrich their roofs by means of strips of wood used ornamentally, either fixed so as to intersect diagonally between the pairs of coupled ties and

Fig. 3. Degrees Hall of the University of Coimbra.

s, which they affected in their roof trusses. the Romanesque Church at Aguas Santas, Oporto, or between the ordinary rafters, Caminha; or, again, on the face of the ing in geometrical patterns, as in the e chapel at Cintra. These roofs were r richly coloured. The deeply-moulded led roofs of barrel or domed form to be seen ny parts of the country seem to be their ndants. One of the finest is that of the of Shields at Cintra, where a square ment is covered by an octagonal timber with its diagonal sides carried on semi- ar ribbed vaults or semi-domes (Fig. 2). latter alone survive from the XVIth ry work, the upper part having been le in the XVIIth. The whole is elabor- coloured and gilded, and the arms of the and nobles and many other devices are duced in the panels. The Swan and Magpie at Cintra likewise have painted panelled gs, the former five-sided the latter three- with the slopes in each case returned at nds. At Coimbra the Hall of the Univer- is also a five-sided barrel with squar s painted alternately blue and red (Fig. 3), t Oporto the above-mentioned cloisters a richly-moulded but unpainted barrel vith panels of various geometrical forms.

E ENGLISH HOUSE FROM HE NORMANS TO THE UDORS.

the 22nd ult. Mr. W. H. St. John Hope, read a paper at Carpenters' Hall, London- on this subject, and showed 121 lantern in illustration of his remarks:

n addressing you to-night on the English from the Normans to the Tudors I se to illustrate by plans and pictures the al changes that evolved from the common uch a dwelling as can be lived in with rt to-day.

e first step in the history of a building is anning of it. Most people now seem to be ned as to their choice of a house by its rance, on paper or otherwise; but our thers thought only of its plan and gement. Old building contracts accord- lay stress solely on the plan and isions, while the style and elevations are much as hinted at, but left entirely in the of the master carpenter or freemason.

Houses at the Time of the Norman Conquest.

vill be convenient as a beginning to inquire sort of houses existed in England at the of the Norman Conquest. Probably not le example is now standing, but a certain nt of information can be gleaned from ents.

s evident from the Great Survey known as sday Book, which was finished in 1086, that XIth century the country houses consisted the humbler dwellings of the cottars, rs, or villagers; and (2) of the more tant farmsteads and manor houses of the h thanes and their Norman successors. the actual nature of the former nothing te is known, and it can only be assumed hey were of a character similar to, and of me perishable nature as, many a labourer's ge of to-day.

e dwellings of the chiefs and owners of rty, on the other hand, were clearly large fty halls, and their sites not improbably be the moated enclosures that are still mmon in many parts of England.

more details of such houses than are hed by the Great Survey we may pass on e forms of agreement by which certain rs in Hertfordshire and Essex belonging Canons of St. Paul's were let to farm the XIIth century. These not only ull particulars of the manors themselves, f the stock and farming implements, otices of all the buildings, and sometimes dimensions. These buildings, moreover, ot new, and there is no reason why many m should not have been much older than orman Conquest. I have only time to o a few.

Ardleigh, in 1141, there were two manors. e were three granges, or barns, and the tic buildings comprised a good hall and er, a tressaunt, an appendage to the wards the south, a privy adjoining the er, and another in the court, a good y, a kitchen, a hay house, and a stable. other manor also contained a hall, with mber next to it, a kitchen, a stable, a bakehouse, and a house for the servants. In the hall were a dormant table, a buffet, and two movable benches.

At Belchamp the house was within a little gate. In 1152 the manor house at Kensworth (Herts) consisted of a *halla* or hall, a *thalamus* or great chamber, and the *domus* or house-self, which was betwixt the hall and the great chamber. The three sections were, therefore, in line. The hall measured 35 ft. by 30 ft., and was 11 ft. high to the roof beams, and the same above. The "house," or parlour (as we should call it), was 12 ft. by 17 ft., with a height of 10 ft. below the beams and 7 ft. above. The chamber measured 22 ft. by 16 ft., and was 9 ft. high below the beams, and the same above. The length of the house was, therefore, about 73 ft. Since the span of the hall, 30 ft., is rather wide for ordinary tie beams, it perhaps consisted of a hall proper of the same width (17 ft.) as the house part, lighted by windows in the gables, and with aisles about 5½ ft. broad, divided off by a row of posts on each side. The whole of the buildings were probably of wood and roofed with shingles. The remains of such a wooden hall, though of late XIIIth century date, exist at Tiptofts, in Essex, and part of the Norman wooden arcade of the great hall of the Bishop of Winchester may still be seen in his castle of Farnham.

Another bit of documentary evidence may be found in the so-called Boldon Book. This is a survey made in 1183 of the then revenues of the Bishoprick of Durham and the assized rent and customs then and formerly due. In the vill of Boldon twenty-two villans were bound to set up for their lord the Bishop, "if there shall be need," a house 40 ft. long and 15 ft. wide; the thirty-five villans in Whickham were similarly holden. In Aucklandshire all the sixty-six villans were bound, on the occasion of the great hunts, to make the Bishop's hall in the forest, with a buttery and pantry, a chamber and privy, and a chapel. The hall was to be 60 ft. long and 16 ft. wide within the posts, which shows that it was of wood, and the chapel 40 ft. long by 15 ft. wide. The twenty villans of Stanhope were responsible for the appendages to this hall, namely, the kitchen, the larder, and a kennel, and they had also to find litter in hall, chapel, and chamber. The chamber was, no doubt, the Bishop's own room, but the hall would serve, as was then usual, not only for meals, but as the dormitory of the servants and attendants.

Here, again, we have a description of buildings "that formerly had been" probably from the foundation of the bishoprick itself.

Our examples of these early houses are not many, and have survived through their being built of masonry instead of wood. For the introduction of stone construction in domestic architecture we have to thank the Normans, who were the first to realise that the methods already used in building stone churches could equally well be applied to their houses and castles; buildings in masonry, moreover, had the advantage of being less liable to destruction by fire.

Houses of the Hall Type.

A comparative examination of the surviving XIIth-century houses shows that they may be divided into two classes: (1) those that carry on the tradition of the common hall; and (2) dwellings of another type, of two stories.

Houses of the hall type are to be sought among the infirmary buildings of the monasteries where the common life prevailed, or in the manors and castles of the great feudal lords, where they served as before as a lodging for the servants and retainers.

The great hall of Chepstow Castle is the earliest that can be dated, since it is almost certainly the work of William FitzOsbern, before 1072. Later changes, by which it was converted into a cellar to a new hall above, have done much to obscure its arrangements, but it still retains its original doorway, of almost Roman design and character, and a number of small windows towards the bailey.

The finer and less altered hall of Richmond Castle is not much later in date. It stands over a cellar, and, owing to its position on top of a cliff, was lighted on both sides by curious two-light windows.

The monastic infirmary was not only the hospital for the sick, but the lodging of the infirm and elderly monks; it was also the temporary abode of the monks who had undergone the periodical blood-letting. For the housing of these several companies an establishment of some size was needed in a large abbey. This took the form, in the XIth century, of a pillared hall, the body or nave of which served for meals and for exercise in bad weather, and the aisles to hold the beds. The infirmary also included a kitchen and a chapel, etc.

At Christchurch, Canterbury, the early XIIth-century infirmary hall was of seven bays and 150 ft. long, with a large chapel at the upper end. At Ely the hall, which was built about 1165, is of nine bays, but only 105 ft. long, with a chapel on the east, as at Canterbury. The infirmary halls at Norwich and Dover Priory had one aisle only.

The best known of the manorial halls is that of the King's Manor at Oakham, in Rutland. It was built of stone, about 1180, in place probably of the earlier hall mentioned in the Great Survey. It is 65 ft. long, and divided by stone pillars with carved capitals into a nave and aisles. The kitchens and other offices have perished, perhaps because they were only of half-timbered construction.

Bishop Pudsey's great hall at Auckland is of the same date and type as Oakham, but later changes have effaced its original condition.

At Appleton, Berks, is a moated manor house which retains the doorway and other features of a handsome little hall, *circa* 1190. It was a simple oblong in plan, but has been subdivided and turned into a two-storied house.

There is a remnant of another interesting example at Warnford, Hants. The hall is 52½ ft. long by 48½ ft. wide, and had four very tall stone pillars to support the roof. At one end was the chamber, over a cellar and offices.

But the finest Norman hall must have been the great structure added to the royal palace of Edward the Confessor at Westminster by William Rufus. It was 238 ft. long, with a span of 67 ft., and was apparently subdivided by two rows of mighty wooden pillars, about 40 ft. high, to carry the roofs, for each of the three divisions had its own. The hall was of twelve bays, and lighted from each side by a row of large windows set at intervals in an ornamental wall arcade, as well as from the ends. This new hall at Westminster was used for the first time in 1099, and when some of those present criticised its inordinate size the King said it was not half big enough, and but a mere chamber to the palace which he would build.

Probably not many of you are aware that the outer walls of the present Westminster Hall are, in the main, those of William Rufus.

Of the kitchens attached to these Norman halls very few have survived. Those at Canterbury and Dover have lost the old arrangements, and the kitchen at Fountains Abbey is one of the few that retains them. It had two chimneys in the middle, back to back, and was vaulted throughout. That at Kirkstall Abbey closely resembled it, and both were so contrived as to serve two dining-halls, between which they were built. A good deal of cooking was, no doubt, done in the open air, after the manner so vividly depicted in that quaint piece of Norman stitchwork miscalled the Bayeux Tapestry.

The Two-Storied Type of House.

The two-storied type of house was square or oblong in plan. Its low basement served as a cellar, and perhaps in part as a kitchen, and the upper story formed the solar or living-room, which was reached by an external staircase. Such a house is depicted in the Bayeux Stitchwork, and shows us how the inmates were occupied. The staircase was usually wooden, but there is a beautiful example in stone at Christchurch, Canterbury, which led up to the old tramps' lodging adjoining the monastery gatehouse. Houses for the accommodation of guests were among the buildings of every monastery. Two, of a date about 1150, are still standing at Fountains Abbey. Each formed a two-storied house with living-rooms on both floors, the lower being a lofty vaulted basement.

Another good instance of a Norman house, *circa* 1160 or so, though now ruined, exists within the precincts of Christchurch Castle, Hants. It is built of slabs of Purbeck marble with stone dressings, and has a basement 76⅔ ft. long and 24 ft. wide, which formed the cellar, etc., and an upper floor with a chimney, and large two-light windows. At one angle was a small room built out over the mill beat, and at the other end of the house was a vice down to the cellar. The upper room was, perhaps, subdivided, and reached by an outside stair at the opposite corner.

Another but fortunately complete example of about the same date is at Boothby Pagnell,

Lincs. It consists of a vaulted basement in two sections, one of which probably served as the kitchen, and an upper story reached by an outside stair. The doorway opens into the screens, beyond which is the hall or solar, with a fine hooded chimney and a smaller chamber. The screens are now largely occupied by a staircase to an upper floor, of Tudor date, formed within the roof.

XIIIth-Century Houses.

The scarcity of XIIIth-century stone houses, as compared with those of the Norman period, suggests that the majority of the manor houses continued, as before, to be built of wood; but so little is known of them that nothing can be deduced as to their size or plan. The stone buildings are still divisible into halls and houses, but the latter now exhibit new types of an interesting character.

The monasteries again provide examples of the common hall. At Waverley Abbey, Surrey, the infirmary hall, built in 1201, had one aisle only, shut off from the nave by a row of round wooden pillars, which were afterwards cased with masonry. The infirmary hall at Kirkstall Abbey, of a date *circa* 1230, also had at first only one aisle, shut off by a line of wooden posts, but about 1300 it was remodelled and furnished with two narrower aisles with stone arcades.

At Tiptofts Manor House, Essex, is a rare instance of the remains of a late XIIIth-century hall of carpentry work, which helps to illustrate the Waverley and Kirkstall examples. At Fountains Abbey the plan remains of a notable infirmary hall, built all of stone by Abbot John of Kent, between 1220 and 1247. The hall was 170 ft. long and 70 ft. wide, and had to the east a chapel attached to a great chamber, or lodging for the visiting abbot, with a large kitchen, etc., adjoining. Remains of like halls may be seen at Gloucester and Peterborough. Monastic infirmaries were not, however, always of this character. That at Jervaulx has a hall of quite the domestic type, built over a sub-vault and reached by an outside staircase, and includes a chapel and other chambers. The kitchen of it stood a little distance away on the opposite side of a court.

The fine hall of Winchester Castle is contemporary with the Fountains example, but differs from it in plan, which is like that of the nave and aisles of a church. It is 111 ft. long, and of five bays, with arcades carried by marble pillars. The windows are transomed and of two lights with side seats. The hall was built by King Henry III. between 1222 and 1232, but the roof was renewed *temp.* Edward IV. The kitchens, etc., which were added in 1234 have been destroyed.

Of the same date and character was the great hall added to the palace at Lincoln by Bishop Hugh of Wells (1209-35). It was 85 ft. long and of four bays, with arcades carried by marble pillars. The doorway into the screens was covered by a two-storied porch, and at the same end were the buttery and pantry and a way to the kitchen, with chambers over. Beyond, over a bridge, was the kitchen itself, built, owing to the fall of the ground, upon a lofty range of cellars. At the opposite end the hall was attached to the older palace of St. Hugh.

A similar addition was made to the palace at Wells by Bishop Robert of Burnell (1275-93). This great hall was 115 ft. long and 60 ft. wide, or a little larger than that at Winchester, and of five bays, with aisles divided off by wooden pillars that helped to carry the roof. At the west end was a porch and a great chamber, etc., above the buttery and pantry, as at Lincoln. The kitchen was beyond, but has been destroyed, and of the hall, etc. only enough is left to show its design and general arrangement. It had lofty windows of two lights with transoms.

Another notable work of Bishop Robert was the large house at Acton Burnell, for which he had a licence to crenellate in 1284. It forms an oblong 95 ft. by 60 ft., with a square tower at each corner, and was divided longitudinally within into two sections. The northern half contained, above a range of cellars, the great hall, with a room over the screens, and the southern half the great and other chambers, raised apparently over the kitchen and offices. For its date the plan of this Acton Burnell house is unique.

Several quite small houses remain to us which had as the principal room a hall upon the ground floor. At Coggs, in Oxfordshire, the remains of such a hall, with beautiful windows, somewhat of the Winchester type, are incorporated in more modern work. A fair-sized house at Charney Bassett, fortunately complete, has upon the ground floor a hall, which has been modernised, with a projecting wing at each end. One contained the kitchen, with chambers over; the other the cellars, with a solar and chapel above, reached by an outside stair.

At Longthorpe, Northants, are the remains of another house with a hall on the ground floor, having attached to one corner a massive squat tower, containing three stories of chambers.

The fine and perfect house known as Stokesay Castle, in Shropshire, is also an example with an appendent tower. It stands on one side of a moated enclosure, entered through a picturesque Jacobean gatehouse. The main division is a great hall on the ground level, of four bays, with open roof and dormered windows. At the north end is a three-storied tower, with cellar basement, and two living-rooms above, reached by a wooden step-ladder from the hall, and provided with chimneys and garderobes. To the south, in line with the hall, is the great chamber, reached by an outside stair and furnished with a large chimney, now enriched, as are the walls, with Jacobean wainscoting. Beneath it is a cellar on the ground level, with another below. Beyond the solar, and connected with it by a small gallery containing the garderobes, is a tall and massive tower of three stories, with living-rooms on each floor. The kitchen, which was semi-detached to the north-east of the hall, has disappeared. The date of this extremely interesting house, for it is nothing more, can approximately be fixed by the licence to crenellate, or fortify it, granted in 1291.

There are many XIIIth-century houses in which the principal rooms occupy the first and not the ground floor. In the larger houses of this class the chief room was still a hall, as in the infirmary of Jervaulx Abbey. In association with this example, since they are practically of the same type, may be mentioned the residences of the bishops and dignified clergy, unmarried men who were given to hospitality and maintained an establishment of some size; they thus kept up to some extent the old idea of the common hall.

Lanfranc's palace at Canterbury was one of the earliest, and another, also of the XIth century, was built by Bishop Gundulf at Rochester; but neither has survived. The Archbishop's palace at Lambeth dates from 1197, and the existing chapel, with its fine sub-vault, must have been begun soon after, but the great hall has been rebuilt.

The palace at Salisbury still contains within it the original house of Bishop Richard Poore, built in 1220 and 1221. It consisted of a hall, a chamber, and a chapel, raised upon a vaulted substructure, which was perhaps the servants' department, with a kitchen and offices projecting at right angles from one end. Access to the hall was probably by an external stair.

The first palace at Lincoln was begun soon after the translation of the see from Dorchester in the XIIth century, but has disappeared. The great St. Hugh (1185-1200) is said to have begun the "new palace," considerable remains of which exist. It seems to have had a hall and a great chamber raised above a series of vaulted cellars and servants' quarters, with a bedchamber, etc., to the south, and the chapel, etc., at the north end. I have already described the great hall added to it by another Bishop Hugh.

The bishop's palace at Wells is, happily, almost intact. It was begun shortly after 1220 by Bishop Joscelin, brother of the builder of the added hall at Lincoln, and consisted originally of a hall 68 ft. long, with a great chamber at one end, and another opening out of it. These were overlapped by a gallery which communicated with the kitchen (probably) at one end and the chapel at the other. The chief rooms were raised upon a vaulted basement, and reached by vices at the ends of the gallery. The chapel was reconstructed during the last quarter of the XIIIth century by the same Bishop Robert who added the great hall.

The Minor XIIIth-Century Houses.

Of the minor XIIIth-century houses one of the earliest and most curious is the abbot's lodging at Kirkstall Abbey. It is three stories high, and though but a floorless and roofless ruin is fairly complete throughout. The basement seems to have been the servants' department. The main floor was the abbot's hall or solar, a comfortable room with a wide chimney; and the second floor, which also h a chimney, probably served as his bedroo The two upper floors were reached by a w staircase within the house. At the west e were the garderobes, and on the east a la chapel upon a vaulted sub-vault, in which w the kitchen. The original windows were two pointed lights divided by a pillar a rebated for shutters or glazed casements.

The house of the Master of St. John's Hospit at Northampton, of a date *circa* 1250, thou much altered, seems to have included a hall, chamber, and garderobe, all on the upper flo with offices beneath.

The parsonage at West Dean, Sussex, is also example, *circa* 1260, of a small XIIIth-centu house. It has a ground story lighted by sm windows, and an upper floor gained by a vi at one corner, with windows of two cusp lights.

Another Sussex parsonage, at West Tarrin has a XVth-century hall attached to a tw storied late XIIIth-century block, with sol upstairs reached by an outside stair.

At Millichope, near Ludlow, is another sm house of simple plan of late XIIIth-century wor It consists of a vaulted basement, which forme a cellar and kitchen, with a wooden stair to t upper floor, which has two nice original windo with pillar mullions and side seats. It on measures 33 ft. by 21 ft.

At Tollard Royal there is a small and co plete house, quite early in the century, consistin like that at Millichope, of an oblong baseme with an upper chamber, or solar, reached by outside stair, but having at one corner an oblo tower with small rooms on each floor.

At Crowhurst, Sussex, are, or were, the rui of another small house, consisting of a solar ov a vaulted basement, with a tower-like por at one corner, which served as a vestibule to outside stair, with a chapel or chamb above.

The charming example of this type at Litt Wenham, in Suffolk, is likewise noteworthy f its perfect condition. It consists of a vaulte basement, which formed the cellar, with a hal like solar above, reached by an outside sta Attached to the opposite angle is a squa tower, with an appendent stair-turret or vic having upon the first floor a chapel, wit shuttered window-openings toward the sola and a low-side window on the north. Abov the chapel is a bedchamber, reached by the vic which also descends to the basement.

At Aydon, in Northumberland, is anothe perfect XIIIth-century house. It is of tw stories, having a cellar with kitchen over at th west end, then the hall (which is reached by a outside stair) over a minor hall for the servant and a transverse wing at the east end, with th servants' kitchen, etc., below and a long sola upstairs. The house stands on one side of court, and licence to crenellate, or fortify it, w granted in 1305, but the buildings seem to b some twenty years or more earlier.

Use of Brick in Building.

Before leaving the XIIIth century a few word must be said as to the early use of brick in building. Though known to and freely use by the Romans, bricks seem to have been neglected or forgotten as a building materia till well on in the Norman period. The fine ar late Norman church at Grimsby has a relieving arch of undoubted contemporary bricks ov the west door, and the late XIIth-century gate house chapel of Coggeshall Abbey, Essex, is not only brick-faced throughout, but has details in moulded brick. Bricks moulded to build arched window heads are also found in early XIIIth-century work in Allington Castle, Kent. In Watton Church, in Holderness, an earl XIIIth-century chancel is largely faced with brick, and the Little Wenham house also exhibits original brickwork. At the beginning of the XIVth century the Corporation of Kingston-upon-Hull was running a brickyard as a commercial speculation, and the large Church of the Holy Trinity there, of a date *circa* 1315-20, is faced throughout with what are doubtless local bricks. Later examples, of course, abound, especially in districts where stone was obtainable only with difficulty and at some cost."

[The remainder of Mr. St. John Hope's paper will be given in our next issue.]

THE LONDON OPERA HOUSE.

The second article on the London Opera House promised for this week is unavoidably held over until next week.

HISTORICAL NOTES.

rotection Historic uildings.

In the House of Commons last week Mr. King asked the Prime Minister whether he was aware that France and other countries scheduled their nt buildings and other historic monuments the object of protecting them as national oms and securing them against vandalism struction; and whether he could promise ation with a similar object to protect historic buildings as the Reindeer Hotel, ury, now threatened with partial demoli-

Mr. Asquith, in reply, said: "I am aware e procedure in France referred to by the member. The First Commissioner of His sty's Office of Works proposes to introduce early date a Bill dealing with the question e preservation of ancient monuments and ings, but pending its introduction I can no statement with regard to its provisions, s to whether the Reindeer Inn at Banbury all within its scope."

rofessor cerell, R.A.

A RECENT issue of the *Journal* of the Royal Institute of British Architects contained an essay by Mr. Ernest Prest- on the life and work of Professor C. R. erell, R.A., one of whose early works was fanover Chapel in Regent-street, demo- a few years ago. Of this building we are o give an illustration, and, in connexion it, the following reference may be quoted Mrs. Russell Barrington's "Essays on the ise of Art," a book full of appreciative ons on modern art.

"ow do we, in this conceited age of ours, those benefits which come down to us from ages?" asks Mrs. Barrington. "How did we treat a beautiful church built in a quite recent generation by a true artist, a master of Renaissance architecture, whose grave is to be found among the greatest of England's children in the Crypt of St. Paul's Cathedral, Professor Cockerell? It had not existed half a century when we pulled it down. Why? To widen the pavement in Regent-street so that the shopping-loving people in this much-frequented thoroughfare should not for a moment be impeded in their important quest."

The Old Chapter Library at Windsor.

SOME interesting discoveries have just been made in the old Chapter Library of St. George's Chapel, Windsor Castle. Over the whole length of the roof of the western walk of the Dean's Cloisters at St. George's Chapel was situate in former days the ancient library of the Dean and Canons of the chapel. In 1662 the library was transferred to its present quarters overlooking Thames-street. Of the space occupied by the old library the larger portion is now the Chapter Room and the smaller portion the office of the Chapter Clerk. The external architecture, the window tracery, and the interior of the present Chapter Room are comparatively modern. Recently, on the appointment of Mr. F. W. H. Deane as Chapter Clerk, the old office was repaired. The ceiling had, up to then, appeared to be only of lath and plaster whitewashed; but after removal of the whitewash and several coats of paint, it was found by Mr. A. Y. Nutt, resident Architect at the Castle, to consist of panels of very fine oak work with bosses of delicate and elaborate carving. These were each and all carefully taken down, cleaned, photographed, and eventually replaced. The centre boss represents a chalice, between the initials "T. B.," reposing on an altar slab of which the five crosses are still visible. The consecrated wafer above the chalice has, however, been chiselled off. Another discovery has been that of a beautiful wooden window with an oaken frame of ten lights, which was found embedded in the wall at the north-east corner. This would have originally looked over the north wall of the Cloisters towards the Deanery. No doubt the whole of the eastern side of the old library was furnished with a series of similar windows.—*The Times*.

Clifton Campville Church.

MR. W. H. QUARRELL writes to *Notes and Queries* as follows:—"The fine church of Clifton Campville, Staffordshire (near Tamworth), has just been saved from ruin—at a cost of about 3,000*l*.—an expenditure of 500*l*. or so being still needed to preserve the ancient windows and to complete the tower. This magnificent building has for many years been in a deplorable state. The XIIIth-century masonry and buttresses in the north wall and the southern pillars have been fully repaired where necessary, and the roof has been put back to its original place. Considerable fresco-work has been discovered, evidently that noted by Shaw, but it is very indistinct. The chantry chapel has been restored, and is now no longer screened off from the church, while the fine roof is once more revealed. The southern aisle, called the Haunton aisle, has been extensively repaired, this being necessitated by the bad state of the stone; and the removal of the poor plaster-work has shown the best features of the structure, and with these an interesting fresco, apparently depicting the founder, Sir Richard Stafford, who built the church about 1353."

Hanover Chapel, Regent-street, now demolished. Professor C. R. Cockerell, R.A., Architect.

By Permission of the Royal Institute of British Architects.

THE BUILDING TRADE.

MANCHESTER BUILDING TRADES EXHIBITION.

THE Building Exhibition organised by Messrs. H. G. and H. C. Montgomery has been opened at the Exhibition Hall, Rusholme. The building at Rusholme represents a city in miniature, replete with all that is up to date in building construction, decoration, and internal fittings. Mr. Montgomery has certainly eclipsed himself at Rusholme. The Hall is an immense one, allowing plenty of scope for broad and effective treatment. The exhibitors' stands, many of which are of elaborate and costly structure, are suitably grouped in the central parts of the Hall. Across the top end of the Hall stretches a picturesque and ornamental garden, which extends halfway down each side of the Hall. This is laid out, and a pergola and other features add to its attractiveness and charm. The combination at Rusholme of placing the exhibits in a setting of Nature's surroundings was a happy inspiration, and has resulted in a most pleasing and successful display. It is unfortunate that the Exhibition should have been held at the present time, and whilst the country is in such an unsettled state, and doubtless business prospects will suffer. Mr. Montgomery appears to have spared no expense in making it a success as a high-class exhibition.

Messrs. Hayward Brothers & Eckstein, Ltd., 187 to 201, Union-street, Borough, London, S.E., have a stand at No. 24D 40 ft. long by 10 ft. wide, and have built a small office at one end of it, in which they have incorporated a number of things, such as their prismatic pavement lights, tiled lights, opening flaps, reflecting stallboards, "Copperlite" stallboards, patent puttyless roof glazing, steel sashes, and casements, and some examples of "Prior" glass —a rich, coloured type of leaded glazing. The firm had the order for the stained glass windows for the Westminster Abbey Coronation Annexe at the time of the Coronation of His Majesty King George V.; and they supplied this glazing, as they have on several occasions, for Windsor Castle. At the other end of the stand the firm have erected on columns a full-size steel puttyless glazed lantern skylight, showing all points of construction of Hayward's "Reform" system, giving the maximum strength, simplicity, and lightness. Around the stand are a series of numerous types of Hayward's patent collapsible gates, showing lift fronts, shop gates, and a large strong H section type for public courtyards, etc. There are numerous other examples, such as ventilators, Sheringhams, mica flaps, "Alliance" roof vents, a plastered panel of Hayward's "Jhilmil" steel lathing for fireproof work, and fire-resisting "Copperlite" glazing, and iron spiral staircases, etc.

The Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., exhibit floors, staircases, and roofs constructed of reinforced hollow bricks. The framework of the structure consists of steel stanchions and horizontal steel joists covering a ground area of 20 ft. by 10 ft. The floor of the exhibit is raised about 3 ft. from the floor level of hall in order to permit of two short flights of stairs being constructed on the Kleine System to lead up to same. This floor is constructed of small size hollow bricks set on edge and reinforced with flat tension bands to form a floor 6 in. deep spanning 10 ft. and built into the webs of girders on either side, only the ends not requiring a support. Above this is constructed a 20-ft. span, 7½ in. thick, built with Kleine patent hollow bricks with closed ends reinforced with round rods and cantilevering slightly beyond the steel frame. A small opening has been left in the middle of this span without trimming joists to demonstrate the fact that openings may be left if desired. On top of this 20-ft. span are built Kleine hollow brick reinforced walls. The 20-ft. span has been built on top of the girders to demonstrate that there is no arch action in the Kleine floors, and consequently there is no thrust on the steelwork. The advantages of the Kleine system are briefly:—Absolute fire resistance, high sound-proof qualities, lightest weight of any floor, no thrust on walls or steelwork, no cracks in plaster of ceilings, can be constructed for any span and for any load required.

The stand of Messrs. Machin & Koenig, Hare-court, 62, Aldersgate-street, London, E.C., shows their Compoboard, which is used for the lining of ceilings and walls, their fireproof asbestos slabs for the same purpose; also their asbestos tiles for roofs. The firm are making a special effort to bring before the public a large variety of hardwood panels for the construction of ceilings, dadoes, walls, etc. These panels are made of plywood in superior woods like oak, mahogany, ash, silvery birch, and satin birch. These woods are shown either framed as dadoes or ceilings in position, or they are shown in large sheets not fixed.

Messrs. R. Waygood & Co., Ltd., makers of lifts and cranes, Falmouth-road, London, S.E., are showing the lift machine only of one of their electric passenger lifts, and the machine only of their small electric service lifts. In addition they have on exhibit a model of Waygood automatic electric passenger lift and a model of a hand-power service lift, as well as lift accessories in the way of blocks, etc.

The leading features of the exhibit of Messrs. S. & E. Collier, Ltd., Grovelands, Reading, are their old-fashioned roofing tiles and reproductions of hand-made brick in various thicknesses, textures, and colours, together with the well known Reading silver grey bricks and red rubbers; also similar texture roofing tiles with varied tints and colours. The other exhibits consist of plain and ornamental roofing tiles in smooth-faced quality, ridge tiles, moulded bricks, terra-cotta hollow blocks for bungalows and cheap buildings, breeze and partition blocks, tiles for curing damp walls, small tiles for porches, old-fashioned pan and Italian tiles, hand-made paving squares, Roman tile slips for doors, window arches, fireplaces and key blocks, hand-made briquettes for fireplaces, air bricks, white and grey sand lime bricks, dovetail breeze bricks for floors, and Silchester art pottery.

Messrs. Frederick Jones & Co., Duncan-street, Salford, Manchester, etc., are the manufacturers of the "Hercules" fireproof partition blocks for all kinds of internal partitioning, and at their stand these goods are shown in the various stages of fixing and finishing, giving a very good idea of their strength, stability, and suitability for this class of work. The goods can be supplied in plaster-concrete, portland-concrete, pumic-concrete, or in the plaster quality with a smooth face on both sides requiring the finishing coat. In addition, their exhibition shows their fibrous plaster ceiling slabs fixed and finished, showing how these goods can be applied cheaply and quickly to ceilings or partitions. The firm are well known as manufacturers of British-made slag wool (silicate cotton), non-conducting material, which is also fire, sound, and heat proof. Samples of this material in the loose state, and also made up into handy forms for pipe, boiler, cylinder covering purposes can be seen and obtained at their stand.

The Saxon Portland Cement Company, Ltd., Cambridge, show the raw material as taken from the quarry, after drying, ground marl ready for burning, raw material ready for kilns, sample of finished Saxon cement, etc. The raw material is a mixed "chalk-marl," consisting of a combined chalk and clay deposit, containing from 15 per cent. to 25 per cent. of clayey matter, and an average of about 79 per cent. of carbonate of lime. As the raw materials in the quarries vary considerably in the proportion of carbonate of lime at different points the moisture is first driven out of the material as quarried to enable it to be ground to an impalpable "flour," so that it can be combined to the correct chemical porportions in special mixers, whose contents are constantly being analysed by the works chemists. This is to ensure the absolute uniformity of the mixture before it is allowed to pass to the next stage of manufacture. The ground marl after leaving the mixers is pressed into blocks for convenience of loading into the kilns. In the case of the rotary kiln the "flour" is conveyed to the kilns for burning. The finished cement is a finely-ground powder, consisting of about 60 per cent. of absolute "flour," and the whole of it is of an average fineness as to leave only 1 per cent. on a sieve having 5,800 holes per square inch. This fineness of grinding is important, as the finer a cement is ground the greater is its cementitious value or power of cementing together particles of sand and aggregate, or other materials having no cohesive power in themselves. The tensile strains developed by Saxon cement after seven days are therefore high, and a minimum of 600 lb. per square inch is guaranteed with every ton sent out from the works. Its expansion under the Chatelier test is only 1·5 millimetres, as compared with the 6 millimetres allowed in the British Standard Specification, and in the boiling test it is thoroughly sound. All Saxon cement is guaranteed to pass the British Standard Specification.

Messrs. G. Jackson & Sons, Ltd., of 49, Rathbone-place, London, W., and Mr. G. P. Bankart, of Baldwin's-gardens, Gray's Inn-road, London, E.C., are jointly exhibiting various interesting examples of modelled plasterwork, also leadwork and stucco work. The exhibit also shows a Georgian treatment for a roomside with panels and door dressings, and likewise an Adam treatment with pilasters and plaque, ornament, etc.

Messrs. John P. White & Sons, Ltd., the Pyghtle Works, Bedford, and New Bond-street, W., are showing oak panelling and their special hospital teak-faced doors at their own stand. In addition to this, they fitted up for Mr. Montgomery a large portion of the hall, consisting of about 20,000 super. ft., as a garden, treated with trelliswork pergolas, in which people may walk about or sit down and rest.

The exhibit of the Gypsum Mines, Ltd., Kingston-on-Soar, Derby, and Robertsbridge, Sussex, consists of Sirapite finished in various ways on brickwork, lathwork, metal lathing, polished Sirapite, Sirapite with a stucco finish, also plasters and Keene's cement.

The stand of Messrs. Thos. Parsons & Sons, varnish and japan manufacturers, Endell-street, Long Acre, London, W.C., is the same as the one they showed at the Olympia Building Trades Exhibition last year—that is, the white enamelled "Battleship." The stand space occupies 600 sq. ft. in a prominent position. The stand has not been re-enamelled since the exhibition at Olympia last year, and has been continuously on view, chiefly at the Crystal Palace, ever since that time. The firm are also making an exhibit of sample panels finished with "Endelflat" and "Lacreite" enamels; and other materials which they are bringing to the notice of visitors are "Opako" lead-free undercoating, "Mosaico" metallic paints, and their new "Trans-ol" friezes. The latter are transfers executed in oil colours, and are, therefore, both washable and permanent.

At Stand No. 57, Row F, "Ronuk," Ltd., have a stand built entirely of oak. The entire surface of the wood has been prepared and polished with "Ronuk," and shows the result of the "Ronuk" method of treating interior woodwork. The firm are contractors for the first preparation and polishing of all kinds of flooring and panelling.

Messrs. Hammond & Champness, Ltd., Alfreton-street, Old Kent-road, London, S.E., are showing lifts.

The Ravenhead Sanitary Pipe and Brick Company, Ltd., St. Helens, have an exhibit of rustic brick facing, including window openings, mullions, transomes, sills, heads, etc. They also show a sand-faced brick wall in different thicknesses of bricks, Sneck walling in rustic-faced work, clinker paving, and other clay manufactures.

Messrs. Chubb & Son's Lock and Safe Company, Ltd., of London and Wolverhampton, and 3, Cross-street, Manchester, are exhibiting various examples of their specialities and latest developments in the construction of security appliances. A group of four strong-room doors is shown of various qualities, also a new type of party-wall door, made of reinforced concrete covered with steel plates according to a special construction for which the makers have obtained provisional protection for a patent. The door shown measures 6 ft. 3 in. by 2 ft. 9 in., and is

od of two steel plates made to interlock
ch a way that the interlocking pieces and
stening rods inside between the two plates
the reinforcing members of the concrete
. The concrete is put in from the open
which are then closed by end plates
ded with inturned and twisted pieces
ided in the concrete. This particular door
ged to a section of a concrete wall which is
ded with a suitable recess. The door has
s own distinct frame, although Chubb &
supply these when required. The fastenings
p and down bolts thrown by a handle
ecured by a lock. This door can be supplied
d or sliding in single or double leaves,
or without frames as required. They can
ade to close automatically in case of fire.
astenings may be simple catches or of a
elaborate character with locks. This
uction is also suitable for partitions or
lete rooms for fire-resisting and other
ses. The firm's light steel adjustable
ng is shown; also safes of various qualities,
ing one of the latest anti-blowpipe con-
ion, together with a section of strong-room
uction of anti-blowpipe material made up
ubb's interlocking steel plates with inner
ining, forming a triple treasury, as supplied
ly to several London banks and also to the
onwealth of Australia. Cases of locks are
, including Chubb's new springless lock.

ssrs. G. R. Speaker & Co., of 29, Mincing-
London, E.C., show a bungalow which is
ly framed with Speaker's "Eternit," both external and internal walls (also ilings), and roofed with red tiles $11\frac{3}{4}$ in. by $7\frac{3}{4}$ in., laid with $2\frac{3}{4}$-in. lap. Bungalows of escription have been erected in all parts country by the firm, and they supply material for all classes of buildings.

stand of Messrs. C. Jennings & Co., merchants, joinery manufacturers, and woodworkers, Pennywell-road, Bristol 58), is a structure illustrating some of any kinds of wood goods which they facture. Prominent features of the exhibit twork arches and screens, doors in various s, a polished teak shop-front, and stairs g from one side of the stand to the other. levation shows twenty-four panels, as es of various kinds of plywood, compo- matching, etc. Attention is directed specimens of oak and ash plywood. kinds are particularly free from defects, e scraped on one surface ready for use. exhibits include two windows, one ating C. Jennings & Co.'s P.T.O. fittings, e other Miller's B.C. system. Doors are in a variety of designs, also balusters -turned, square-cut, and fret-sawn) and ,and other examples of their manufactures. are shown in about forty designs, and g, garden gates, and balcony balustrading ous designs. Some of the fencing samples osoted by force, and others treated with en (registered) wood preservative. The patent geyser is shown, and there will be strations of its working at frequent ds, and mouldings, electric light casings, cture rails are on exhibition, as well as re chimney-pots. The exterior of the (with the exception of the shop-front) is with Kang-He enamel, manufactured mes Rudman, Cambrian Colour Works, street, Bristol. Messrs. Jennings are also ing a four-fold brass-jointed souvenir ld at 7d. each, and a new fully-illustrated ue containing 264 pages, which can be ed at the stand for 5d.

rs. Ragosine & Co., Ltd., Albion Wharf, London, are showing Dixon's White, is a new paint base used in place of lead. The makers particularly wish to sise that their article is not merely a ute for white lead; it is, it is claimed, r to that old-time poisonous substance, as qualities which the latter does not . For instance, white lead becomes ed by the sulphur compounds contained ated atmosphere, but Dixon's White s unaltered. An experiment proving this g shown at the stand. Dixon's White ates much more thoroughly than white and the covering power is infinitely , while it is much more economical. eat advantage is that the material is isonous, and by using a non-poisonous he workman can insure himself against isoning.

Row G, Stand 74, Elliotts' Moulding inery Company, Ltd., Newbury, the old- hed firm of woodworkers, are exhibiting of selected Cuba mahogany doors and

The "Eternit" Stand.

frame, surmounted by a carved over-door. The moulded and raised panels of the doors are heavily bolection moulded and cross banded with satinwood. The whole has been highly French-polished and afterwards cut back to a dull finish. The firm exhibit two yellow pine turned and fluted Ionic columns and carved caps. There are also shown a number of pieces of dado panelling in satinwood, brown oak, Austrian wainscot oak, and Spanish mahogany, together with various samples of mouldings (features of which are the cleanness and sharpness of the work), and numerous photographs of work recently executed. Their two notice-boards, in Spanish mahogany, are worthy of notice. Messrs. Elliott are the manufacturers of an improved kind of revolving door (Buckingham's patent), particulars of which are given in their catalogue.

Messrs. J. & H. Patteson, marble, granite, and mosaic workers, 96, Oxford-road, Manchester, are exhibiting examples of their work in marble for wall linings, marble pavements, marble steps, pedestals for statuary, chimney-pieces, monumental work, etc. In mosaics they show examples of hand-placed Roman mosaic, marble adamant terrazzo, marble Granito pavements, etc., steps in adamant terrazzo and marble Granito in a variety of colourings. An exhibit of the actual working, cutting, and fitting of the marble cubes for the hand-placed Roman mosaic will be given during the progress of the exhibition by Italian mosaic workers taken from the staff of the firm. Messrs. Patteson also show dados in their special marble Granito wall lining; alabaster work for fonts, pulpits, reredoses, wall decorations, etc., granite work (examples of every British and foreign granite are shown for buildings, pedestals, monuments, shop-fronts, etc.) and tiling (a selection of specially-designed dadoes in hand-finished and brilliant enamels, and various glazes in a variety of colours). Of monumental work examples are shown of Runic crosses in American and Scotch granites. The Westerley or American granite cross on view is specially designed and worked for this exhibition, the intricate Runic ornament being finely carved and finished. Attention is called to the St. Martin's Cross, a copy of the well-known Cross of Iona. Other examples of monumental work are shown in Carrara marble and Furness limestone. A special exhibit is being made by the firm of a variety of useful and ornamental articles in Cornish and Serpentine marbles, for table christening fonts, pedestals, vases, rose-bowls, candlesticks, etc.

Messrs. Jones & Attwood, Ltd., of Stourbridge, specialists in apparatus and machines for modern sewage works, exhibit at Stand 101, Row K, interesting models of their sprinklers for covering bacteria beds and filters, and converting contact beds so as to increase their efficiency. The models revolve round circular filters and travel to and fro on rectangular ones, and these distributors are automatic, being driven by the sewage itself without cost for power, and a single distributor can be made to travel up and down a filter 300 ft. or 400 ft. in length sprinkling in the form of rain in both directions of travel so that the sewage is well aerated and the filters are rested between each dose, which amounts to not more than one gallon per square yard, the rate of travel being proportionate to the quantity of sewage. This method of sewage purification is now being generally adopted, and enables a filtration of the highest class to be effected even on filters as shallow as 3 ft. Some filters, circular in shape, may be as small as 8 ft. in diameter, and are very suitable for isolated country houses or small institutions. Messrs. Jones & Attwood show many other specialities for use on sewage works.

In Row D, Stand 29, Messrs. D. Anderson & Son, Ltd., Roach Road Works, Old Ford, London, E., show their "Marosa," a wall lining in which some very fine marbling is reproduced. It is made in sheets (24 in. by 16 in. by about $\frac{1}{4}$ in.) in nine different shades, by means of which some highly decorative effects may be obtained.

In Row E, Stand 46, the Crittall Manufacturing Company, Ltd., of Braintree, show the "Crittall" metal windows, jointed steel sashes, and metal furniture and storage appliances. The "Universal" (patented) casements can be had in all sizes to fill openings to any size, and ventilators of all types to the same detail. They are supplied in solid steel, Koperoid, or bronze. The patent "Fenestra" jointed steel sashes for all classes of commercial buildings are shown, and the metal furniture includes lockers, filing cabinets, hospital fitments, racking, and shelving.

In Row E, Stand 43, Messrs. Pinchin, Johnson, & Co., Ltd., Minerva House, Bevis Marks, E.C., show "The Temple of Minerva," consisting of four sets of double columns, supporting a circular entablature and dome, the whole being surmounted by a cupola. It is entirely finished with Satinette enamel—gloss white and flat white—with the exception of the dome, which is gilt. The Satinette enamel gives a perfectly white, smooth, and lustrous surface, as will be seen from an examination of the columns. It is further illustrated upon a panelled section of wall and a door, where the contrast of gloss white and flat white is revealed. Minerva

paint, which the firm guarantee to be pure, is shown upon a revolving exhibit. Primer, opaque white for undercoats, gloss whites, and flat whites for finishing are displayed in order of application, together with specimen of each of the twenty-four standard colours or stainers and the ninety-six proportionate reductions obtained therefrom by simply adding certain quantities of gloss white. Deydo distemper is also shown. It is not an ordinary distemper, but a washable water paint. Veritone, a new stain and scumble, is shown as a stain on pitch-pine panelling. The panels are finished with Minerva flat varnish, while the stiles and rails are in Minerva brilliant varnish. Several panels are also on view where Veritone is used as a scumbling or graining colour for a ground coat. "Minerva" varnishes, "Silveroid" (a silver paint), "Syronite" (rust preventative), and other specialities are also to be seen.

In Row F, Stand 53, Messrs. Sissons Brothers & Co., Ltd., varnish, paint, and colour manufacturers, of Hull, and 199B, Borough High-street, London, S.E., give in their exhibit a representation of the interior of a first-class modern drawing-room furnished and decorated throughout in the Adam style. A feature of this scheme is that "Hall's Distemper" is used in the colouring all through. The panels into which the walls are divided are tinted with a delicate shade of green, the ceiling being treated in white. All the woodwork, doors, and mantelpieces are treated in Messrs. Sissons Brothers' "Orientolac" and "Sisco" white japan. The outside of the exhibit, as well as the inside, is designed, decorated, distempered, and painted in a similar manner, the shades being selected from the range of over seventy colours in which "Hall's Distemper" is made. The interior lighting of the stand is in keeping with the general scheme.

THE LONDON ASSOCIATION OF MASTER DECORATORS.

A MEETING of the General Committee was held at No. 92, Queen Victoria-street on Monday, February 12, Mr. C. E. Wilkinson in the chair.

The Committee proceeded to the consideration of the publication of the revised Report of the Educational Committee, in conjunction with letters from the London County Council appointing February 15 for receiving a deputation.

After discussion it was agreed that the deputation should consist of the members of the Educational Committee, together with Messrs. J. Baird, H. H. Holliday, T. S. Rowden, and Young, and also Mr. A. S. Jennings.

Mr. Anderson proposed and it was agreed that the letter to the members of the Association and the full Report of the Educational Committee should be published.

Work for Slack Seasons.

The Committee then proceeded to consider the desirability of urging local bodies as a means of relieving distress and meeting trade conditions to arrange their painting and decorating contracts at times when business was slack, and in consequence much unemployment existed.

Mr. Anderson said the matter had to be looked at from many points of view, not from the decorator's point of view only. He had had the matter very much before him for ten or twelve years on the Borough Council of Kensington, where it had come up each winter for discussion. He had endeavoured to get the work of the Borough arranged so as to be done as much as possible in the slack time, and the Borough of Kensington had arranged during the last four or five years to do as much work as possible in that time.

The Chairman asked whether any harm would be done by sending a copy of the resolution of the Association to the various local bodies, asking them to consider it.

Mr. Anderson said it was necessary to formulate some practical scheme showing how it was possible. Most of the public bodies were occupied during the slack season, and to do the work in that season would require a good deal of arrangement.

The Chairman thought most buildings were to a very great extent occupied all the year round.

Mr. Anderson said that, unfortunately, as far as painting was concerned, the majority of the public buildings were done when everybody else was busy, in the long vacation, as it were. The officials were away, and the place was more or less shut up. Even hospitals and schools were always done at that time.

The Chairman thought there could be no slack season in workhouses and hospitals.

Mr. Anderson said there was no slack season with them, but they had the bulk of their work done at the busiest time. It would mean that the officials of those buildings had to take their holidays during the slack time in the trade.

The Chairman asked what the officials had to do with the case.

Mr. Colley said they could not have the workmen in their offices while they were at work.

The Chairman said what he had in his mind was more particularly the question of hospitals, workhouses, infirmaries, and buildings of that kind, where there was no holiday season except for certain of the officials, and he did not see why the officials should be studied in that connexion. They were the last people who should be studied, having regard to the serious nature of unemployment.

Mr. Anderson instanced public libraries as buildings which were used very little during the holiday season.

The Chairman said, taking hospitals and workhouses alone, they would provide a considerable amount of work if they were done while business was slack.

Mr. Colley said it would be impossible to deal with hospitals at the slack time of the year, because they were then fuller than ever.

The Chairman thought they were full all the year round.

Mr. Colley said they were not so full in the summer-time as in the winter, because in the summer they could get many of the patients away to convalescent homes.

Mr. Anderson said he did some work one year at the Chelsea Hospital for Women in the Brompton-road. That hospital arranged for the moving of the patients out of the hospital when the work had to be done, and the hospital was practically empty for two or three weeks. The great point was that all the doctors who gave their services free were away for their holiday at that time, and the principal difficulty seemed to him to be the usages of society. Even workhouses were much more occupied during the winter than the summer. It was a most admirable matter if it could be arranged, but he did not know how it was going to be done. It was no use throwing out vague suggestions without giving some practical directions. Over and over again he had been asked to propose a scheme, and he had been really unable to do so. He should certainly not like to be one of a deputation to go to any public body suggesting that they should have their work done in the slack time of the trade. He had not yet been able to see how it could be worked.

The Chairman thought such experience was very valuable.

Mr. Anderson said he had tried year after year to give employment to men so that they might not be walking about the streets in crowds during the slack season, but he had failed.

Mr. Milton said there was a great deal of work that could be done in winter.

Mr. Dakin did not see that more could be done than pointing out to public bodies the desirability that whenever possible the work should be done in the slack season.

Mr. Milton thought that course had been already pursued.

Mr. Anderson said it had been done year by year by associations and other bodies. At the beginning of each year his Borough Council had had the matter before them, and had received deputations, and had discussed the subject, and had never been able to get a suggestion of what really could be done.

The Chairman said unemployment was not likely to become acute just now, having regard to the fact that the winter was now on the wane.

Mr. Anderson said that if any suggestion could be brought forward now was the time, so that it could go before the various Committees in order that they might have time to formulate anything that could be done for next winter. It was no use going to a Committee in September or October to suggest to them altering their arrangements to do work that winter.

Mr. Anderson thought it would be well to publish the matter in the report of the proceedings, and ask for suggestions from the members of the Association and refer it to the General Committee for further discussion.

It was agreed that the members of the Association and the trade should be invited to offer general suggestions on the subject.

The Committee next considered the subject of adopting a discharge certificate in connexion with the trade. The idea was a certificate which the workman could carry containing particulars of his various employments, the length of time such employment was held, etc.

The Chairman said he would make a note to obtain samples and estimats of the proposed books in accordance with the suggestions that had been offered, and submit them to the next Committee.

It was agreed that the general meeting should be held on March 25, and that the following items should appear on the agenda:—(1) Action to be taken with reference to the Insurance Bill; (2) report of the Educational Committee and the deputation to the London County Council; (3) to discuss the issue of certificates of employment and discharge.

GENERAL BUILDING NEWS.

NEW CHURCH, FORFAR.

The Lowson Memorial Parish Church, which is to be erected in Forfar, has been designed by Mr. A. Marshall Mackenzie, architect, of Aberdeen, and the building will provide accommodation for about 700 people. It is also proposed to erect a manse at the south side of the church and a hall to seat about 300 people.

NEW BUILDINGS, REGENT-STREET, LONDON.

New premises for Messrs. H. J. Nicoll & Co., Ltd., are being erected in Regent-street from designs by Mr. Henry Tanner. The buildings will form the central feature of a continuous block between Glasshouse-street and Regent-place when the complete reconstruction has been effected. The front elevation has been completed three months within the scheduled time, and the contractors, Messrs. Holland & Hannen, expect that the other alterations will be finished by next September.

ROCHDALE INFIRMARY EXTENSIONS.

The extensions to this infirmary are estimated to cost about 18,000*l.*, and the new work to be erected includes a pavilion to contain fifty-six beds, kitchens, bathrooms, stores, etc. The architect for the work is Mr. Hugh Healey, A.R.I.B.A., of Messrs. Jessop Horsfal & Healey, architects, of Rochdale and Manchester.

NEW HALLS, YOKER.

These buildings are being erected on a site adjoining the Yoker Parish Church, and the seating accommodation provides for 450 persons. The architect for the work is Mr. H. D. Walton, of Glasgow, and the estimated cost of the buildings is 1,600*l.* The contractors are:—Messrs. M'Leod & Campbell, masons; Mr. James Wilson, joiner; Messrs. Peter White & Co., slaters; Messrs. R. P. Duff & Co., plumbers; Messrs. William Graydon & Miller, plasterers; Mr. Simon Kemp, painter.

NEW LIBRARY, CLYDEBANK.

It is proposed to erect a new Carnegie Library at a cost of about 10,000*l.*, and the building will have a frontage of about 100 ft. and an elevation of 40 ft. The architects are Messrs. Gardner & Whyte, of Glasgow.

TRADE NEWS.

Under the direction of Mr. A. V. Gardner, architect, 164, Bath-street, Glasgow, Boyle's latest patent "air-pump" ventilators have been applied to the New Picture Theatre, Smith-street, Glasgow.

Messrs. E. A. Roome & Co., builders and contractors, of 36, Basinghall-street, E.C., have taken into partnership their manager, Mr. F. J. Gayer. The title of the firm will remain as before.

The validity of Booth's patent as applied to the plant made by the British Vacuum Cleaner Company, Ltd., has been upheld by the House of Lords. The judgment of the Court of Appeal, affirming the judgment of his Lordship Mr. Justice Neville, has been affirmed by the House of Lords.

The Catholic Cathedral Schools, Plymouth, are being supplied with Shorland's warm air ventilating patent Manchester grates and inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

The well-known joinery works of Messrs. Samuel Elliott & Sons, Ltd., of Caversham, Reading, have been carried on for the last three or four months by the Receiver and Manager, and we are informed that the large staff of skilled workmen have been working overtime in order to cope with the orders in hand. We are asked by the Receiver to state that he is prepared to enter into negotiations for the amalgamation or purchase of the concern, and could probably arrange to finance a considerable portion of the purchase price. Enquiry should be addressed to the Receiver, Mr. Sydney W. Tubbs, F.C.A., 28, Basinghall-street, E.C.

Messrs. Patman & Fotheringham, Ltd., 100 and 102, Theobald's-road, London, have secured a large contract for pulling down and rebuilding Nos. 171 to 177, Great Portland-street, London, W.

n and after the 15th inst. the offices and ehouse of the Yale and Towne Company m which only a wholesale business is con-ted with the trade) will be removed to 17-20, t Smithfield, London, E.C., where con-rable additional accommodation has been vided for the business.

WOODWORKERS, LTD.

he first annual report of the Woodworkers, , who commenced building a new works at shworth in November, 1910, and began the ufacture of joinery on June 1 last, shows a e of 24,693*l.* This is the result of the bined business of the concern and of the eral Builders, Ltd., with which it was lgamated towards the end of last year. r meeting all expenses, charging revenue depreciation on building plant and hinery, 4½ per cent. interest on loan stock, there was a profit of 985*l.*, from which a lend of 4d. in the pound has been declared urchases of customers and on the wages of loyees. Mr. William Grant is the manag-director of the Woodworkers, Ltd., which been chiefly engaged in manufacturing oinery required for the various co-partner-estates.

PLICATIONS UNDER LONDON UILDING ACTS, 1894 to 1909.

Tuesday's meeting of the London County ncil the following applications under the lon Building Acts were dealt with. (The es of the applicants are given in paren-e) :—

Lines of Frontage and Projections.

ttersea.—Erection of a building and ed way at the rear of Nos. 24 and 26, on-road, Battersea, to abut upon the tern side of Musjid-road (Messrs. J. A. J. dward & Sons for Mr. B. J. Bosher).—sed.

sbury, Central.—Projecting crane at a ing on the western side of Goswell-road, bury, abutting upon the northern side of val-street (Messrs. Hobden & Porri).—ent.

enwich.—Erection of buildings next to onsfield-road and Westcombe Park-road, nwich (Messrs. Davis & Emanuel for Mr. Yarrow and Mr. F. E. Elliot).—ent.

mpstead.—Bay-windows and a porch to houses on the northern side of St. Cuth-t-road, Hampstead (Messrs. Rix & ns).—Consent.

isham.—Greenhouse at No. 76, Granville-, Lewisham, next to Eliot-park (Mr. J. W. s).—Consent.

isham.—Erection of buildings on both of Bartram-road, Lewisham (Mr. J. E. ury for the Abbis's Trustees).—Refused.

isham.—Addition in front of No. 116, -vale, Lewisham (Mr. A. R. Westworth Mr. E. C. Christmas).—Consent.

ylebone, West. — Re-erection of the h of the Annunciation upon a site on orthern side of Bryanston-street and the n side of Old Quebec-street, St. Maryle-(Mr. J. G. P. Meaden for Mr. W. J. r and the vicar and churchwardens).—nt.

ylebone, East.—Four projecting balconies nt of Nos. 171, 173, 175, and 177, Great nd-street, St. Marylebone (Mr. R.).—Consent.

nd.—Projecting sign at No. 3, Piccadilly-next to Shaftesbury-avenue (Mr. C. A. for Messrs. Frank, Ltd.).—Consent.

tminster.—Erection of the clock-tower at ehouse building on the southern side of all Bridge-road, Westminster (Mr. Stowell for Hovis Bread Flour Com-Ltd.).—Consent.

lwich.—Iron and glass hood at Nos. 68 70, Dallin-road, Plumstead (Mr. W. rey)—Consent.

Width of Way.

techapel.—Erection of a building at St. ce Schools, at less than the prescribed e from the centre of the roadway of row, Union-street, Whitechapel (Mr. Leslie).—Consent.

idth of Way and Lines of Frontage.

nington.—Erection of buildings upon a n the western side of Dolland-street, th (Messrs. J. A. J. Woodward & Sons Messrs. J. Dennis and H. Ryland).—d.

ham.†—Erection of a one-story addition rear of Nos. 91, 93, and 95, Rye-lane, m (Messrs. W. T. Champion & Son).—d.

George, Hanover-square.—Projecting t the Victoria Palace, on the eastern side of Allington-street, Victoria-street (Messrs. F. Matcham & Co.).—Consent.

Lines of Frontage and Construction.

Lewisham.—Building of a temporary character on the eastern side of No. 163, Killearn-road, Catford, next to Torridon-road (Mr. A. Ward).—Consent.

Marylebone, West.—Temporary range of luncheon and store sheds at Lord's cricket ground, abutting upon St. John's Wood-road, Wellington-road, and Wellington-place, St. John's Wood (Mr. W. H. Slatter).—Consent.

St. George, Hanover-square.†—Retention of buildings at the premises of the British Motor Cab Company, Ltd., Grosvenor-road, Pimlico (Captain D. A. Lynch for the British Motor Cab Company, Ltd.).—Refused.

St. Pancras, South.—Iron and glass shelter over the Pentonville-road entrance to King's-cross Metropolitan Railway station (Mr. F. Sherrin for the Metropolitan Railway Company).—Consent.

Width of Way and Construction.

Poplar.—Two temporary iron sheds on the south-eastern side of Deptford Ferry-road, Millwall (Guelph Patent Cask Company, Ltd.).—Consent.

Width of Way, Frontage, and Construction.

Wandsworth.—Retention of two buildings of a temporary character at the rear of No. 24, Lewin-road, Streatham (Mr. J. P. Bastard).—Consent.

Space at Rear.

Chelsea.—Alterations to a building at Adam's-mews, Cheyne-walk, Chelsea (Messrs. F. C. Trafford & Son for Mr. H. Smith).—Consent.

Limehouse.—Re-erection of the "Cock" public house, Nos. 3 and 5, Broad-street, Ratcliffe, with an irregular open space at the rear (Messrs. W. Bradford & Sons for Messrs. Taylor, Walker, & Co., Ltd.).—Consent.

Paddington, South.—Additions upon the space at the rear of Nos. 114, 114A, and 116, Westbourne grove, Paddington (Mr. G. A. Sexton).—Consent.

St. George.—Erection of a building upon the site of No. 44, Grove-street, St. George-in-the-East, abutting also upon Fairclough-street (Mr. F. E. Mennie for Messrs. A Miller & Son). –Consent.

Deviation from Certified Plans.

Finsbury, Central.—Erection of buildings upon the site of Nos. 52, 53, and 54, Chapel-street, Finsbury (Mr. F. C. Spiller for Mr. H. Erdman).—Consent.

Width of Way and Space at Rear.

Westminster.—Erection of two houses upon a site abutting upon Wood-street, Cowley-street, and Little College-street, Westminster (Mr. E. L. Lutyens for Sir Henry Norman and the Hon. F. McLaren).—Consent.

Alteration of Buildings.

Hampstead.—Alterations at No. 47, Fairfax-road, Hampstead (Mr. A. C. Cross for the trustees of the late Mr. T. Yeo).—Consent.

Paddington, South.—Enclosures to a bath-room at the rear of No. 46, Queen's-gardens, Hyde Park (Messrs. Richardson & Gill for Mr. C. H. Fox).—Consent.

Westminster.—Addition to the existing top story of No. 120, Victoria-street, and the erection of an additional story to No. 122, Victoria-street, Westminster (Messrs. C. Heathcote & Sons for the Edinburgh Life Assurance Company).—Consent.

Cubical Extent.

Fulham.—Erection of buildings at the Manbré Saccharine Works, Brandenburgh-road, Fulham (Manbré Saccharine Company, Ltd.).—Consent.

Lewisham.—Additional cubical extent in respect of alterations and additions at the garage of Messrs. Thomas Tilling, Ltd., Molesworth-street and Salisbury-yard, Lewisham (Messrs. Gilbert & Constanduros for Messrs. Thomas Tilling, Ltd.).—Consent.

Southwark, West.—Erection of an iron building on the flat roof of Nos. 211-215, Blackfriars-road, Southwark (Messrs. G. Pearson & Son for Messrs. J. Gosnell & Co., Ltd.).—Refused.

Uniting of Buildings.

City of London.—Uniting of shops in the arcade over Liverpool-street (Metropolitan Railway) station, and buildings Nos. 23 and 24, Liverpool-street, City (Mr. C. de W. Kitcat for the Metropolitan Railway Company).—Consent.

Queens' College, Cambridge, showing President's Lodge.

THE CARPENTERS' HALL LECTURES:

HOUSE BUILDING.

THE sixth of the present series of Carpenters' Hall lectures on the Arts Connected with Building was delivered on Wednesday, February 28, at Carpenters' Hall, London-wall, Mr. Percy Preston, Past-Master, presiding, when Mr. M. H. Baillie Scott lectured on "House Building, Past and Present."

The lecturer, who showed a number of interesting lantern slides, said in the modern world, it seemed to him, house building was not taken seriously enough as a subject of art, and, as he believed that art should find (as it had in the past always found) its main expression in the building of houses, which was man's way of decorating, or disfiguring, the world we live in; and as he thought it did not matter so much what we put in our picture galleries as long as our streets are full of living art, he would first consider the houses of the past, by which he meant the houses built in those dark ages of old England before people became sufficiently enlightened and sufficiently educated to build the modern board school and to live in the modern jerry-built suburban villa. It was the noble part of such a company as the Carpenters' Company to foster and encourage that pride and joy in creative work which was the mark of the old craftsman. It was concerned not so much with a minimum standard of wages as a minimum standard of work, and it seemed to him that the chief need in the industrial world of to-day was to study the spirit and methods of our old trade guilds and seek to reconstruct some such system in the training of our craftsmen to give them back that lost heritage of theirs—those deep and satisfying joys which good work alone can give. And the net result of this system in the past was these old houses which we have lost the art of producing. If we study it carefully we should find the first lesson we have to learn from it was the absolutely vital importance of building technique. It was hardly too much to say that the whole of our modern methods and ideals of building were wrong artistically, and we touched here the very root and centre of the failure of modern work. Architects might make beautiful designs on paper, but when you see these designs interpreted by the modern high-class builder you must end by sorrowfully inscribing "Ichabod" over the doorway, for all the glory had departed.

Go to such an old house as Haddon Hall, for example. Apart from the various architectural features which were but passing fashion, where did the root of its beauty lie? Was it not in mere building? Every square yard of its masonry was full of interest and vitality and subtle variety. And what was the principle that underlay it all? We heard a good deal of talk nowadays about texture, as if that were an end in itself instead of a result of right principle. And the principle appears to him to be that building should be an education of materials. And just as the ideal human education was that which evolved all the best in the individual, instead of levelling all to the uniform standard of the particular school, so the ideal education of a material consisted in shaping it to its place in the structure with only such sacrifice of its individuality as its function there demanded. That was always understood in old work. In modern work the desire for mechanical accuracy had led to the obliteration of the characteristic qualities of materials. In this education of a material, then, he meant that the work done in it should help to express those of its qualities which were peculiar and unique. A brick should look like a piece of burnt clay, a bit of mother earth, moulded to man's ends, but still of the earth earthy: stained and marked it might be in its ordeal by fire. As such it was much more than a mere coloured rectangle. We could read its whole life-story in its form and surface.

Any comparison between the methods of the past and present in building disclosed all the difference between a living art and a dead formula. Take, for example, the treatment of a floor in an old cottage. The joists would be full of character. Their outlines would have the slight undulations suggested by the grain. They would not be exactly straight or exactly level. You might go in a dozen cottages and each would vary in treatment. There would also be pleasant undulations in the plaster, and nowhere would we find the brutally rigid, mechanical outlines of the modern room. Turn to any modern text-book on building, and you would find no hint conveyed to the student that construction was anything else but a dead and trite formula. Joists—mere scantlings without any possible kind of interest—were shown there placed 15 in. apart from centre to centre, and below these the inevitable plaster ceiling with its badly-designed moulded cornice and so on. There was no suggestion that the whole art of building begins in the placing and shaping of its materials in such ways that the characteristic beauties of each are drawn out. You would not find a line to suggest that building was an art at all, but it was presented as a peculiarly dismal science. Building thus being made a dead letter, our architects were reduced to conceal the poverty of essential building by all kinds of histrionic superficial adornments. The next vital principle we might learn from the old house was the principle of relation, by which he meant that the beauty of anything was not so much intrinsic as relative, and the beauty of building depended on the reciprocal relation of its parts to one another, and then to the relation of the whole to its surroundings. In the country house this principle of relation would find itself chiefly expressed by the connexion between the house and Nature. It was in this respect mainly that the modern country has failed. If we consider the modern houses which we build in the country shall we not generally find that, however well designed they may be in themselves, they leave us with the impression of a cockney importation from the town of the latest developments of architectural thought there. Especially was this the case with the formal XVIIIth-century scheme now so much in vogue. This had its place in the sun, no doubt, and there were natural sites which seemed to demand just this kind of house built in the old sympathetic way. But when you come across one of these formal schemes in a Surrey wood with a few ragged pines in the front garden it made the whole of the natural surroundings appear to want grooming.

Houses in windswept open spaces near the sea and on exposed hillsides alike seemed to demand a certain ruggedness of aspect. They should look like hardy out-door open-air creations, and not seem to demand protection from the elements; and inspiration for buildings in such positions might well be sought from the old castles, which seemed to add so much beauty to wild and rugged places. By level pastures and slowly winding rivers the personality of the house might become more kindly and gentle, and the less rigorous outlines of timber and tile take the place of the more austere qualities which belong to rugged stone and slate.

In close connexion with relation was what might be called "scale." It was chiefly the recognition of scale which made the old cottage so attractive. In these humble dwellings the inevitable smallness of the plan was accepted and appeared right, because every feature and detail was made correspondingly small. The windows, doors, and staircase were all of the cottage kind, and everything was in scale. In the modern cottage or small house the traditions of villadom suggested that smallness was an evil not to be accepted with due humility, but to be protested against wherever possible. Thus the rooms were contracted on plan that might still remain lofty, windows might be made large, and the staircase could be made a feature, and so on. And the final result was that, instead of a comfortable and compact cottage, the building appeared to be vainly struggling against inevitable limitations. Nothing was so important to remember in cottage building as that the smallness of the parts increased the apparent size of the whole. The beauty of the old cottage seemed to consist largely in the frank acceptance of limitations. Necessity was made a virtue indeed, and the designer, since he must make a small thing, chose to fall in love with smallness. Since, too, he could only use simple homely materials, he would make homeliness and simplicity his ideals, and so successful was the result that these simple old cottages often put to shame their more pretentious neighbours.

As to the planning of old houses in the earliest times, the house consisted of one room. It was unicellular, and its development consisted in the formation of secondary specialised cells or rooms grouped round the central apartment. In the old English manor house this development proceeded in two opposite directions from a central axis. This axis was the passage which went right across the house at the lower end of the hall or main apartment. On the one side of this were developed the apartments for service, while at the opposite (or dais) end of the hall the withdrawing-rooms and all that part of the house which was devoted to the elegancies of life were added. As these accessory apartments increased the functions of the hall were gradually absorbed by the special apartments, and so it gradually shrank to the dimensions of a mere passage with a staircase in it. It still retained its old central position as the axis of the house, and in this condition we find it in the XVIIIth and XIXth centuries in the plans of the majority of houses, with the difference that on restricted town sites the kitchens have been pushed from their positions on the side of the hall to the back.

While admitting the reasonableness of the
n which had reduced the hall to a passage
fely, we found the type of house which had
ialised rooms only, not entirely expressive
ur needs. It lacked focus and coherence.
as we passed from one specialised room to
ther specialised room never could we
as of old: "I am here in the house." We
er achieved more than the occupation of
mpartment. We must either study in the
dy, dine in the dining-room, sleep in the bed-
n, or withdraw to the withdrawing-room.
d so we sigh for the old houseplace or hall
a place to foregather and dissemble in.
d we sigh for it all the more if we must
ds live in a small house, because then our
e specialised rooms were each and all too
ll for comfort, and as we go from one
e plastered box to another little
ttered box it occurs to us that in the
fines of this bit of space we have walled
roofed in surely there was room for one
nt apartment for which it might be
th while to sacrifice something. Let us
up studying in the study, withdrawing in
drawing-room, or even dining in the
ng-room to get that. And thus we
ve at the conclusion that the requirements
amily life in the small house suggest a
eption of the house which shall contain
ast one good-sized central room, and for
sake of this accessory rooms should either
deliberately eliminated or reduced to a
ss in the main apartment. The multi-
tion of small rooms in the small house
after all, no expression of actual needs.
the planning of the modern house let us
ate the old house mainly in this: That
lan should be the outcome of our require-
s, and, while so satisfying material needs,
ould also minister to something more
those. Let us design it from within
ards, and let its outward aspect be the
ral expression of its inward grace.
the matters of decoration and furnishing
might be learnt from the old house.
do people, otherwise sane and intelligent,
rently delight in surrounding themselves
all kinds of unnecessary and unbeautiful
s? "Copy if you like the old methods
workmanship, because they were the
ally right methods, or copy the old
rtions or any other essential or vital
iple which is right yesterday, to-day,
o-morrow; but let the superficial saliencies
le go! Within limits such as these we
rightly design our modern rooms on the
of old ones, imitating nothing in them
the fundamental principles on which
beauty depends. In such work we
find space for some expression of that
nal initiative which was the character-
of the old work. We, too, may invent
reate, and in the expression of our joy
doing add the essential note to the

at were the main conditions of modern
hich made it difficult not to imitate the
of the old house, but at least to
se the methods which led to its beauty?
f the foremost was that obsession of
and the academic tradition, under the
f which authority art becomes tongue-
and all the spontaneous and human
t art of the past was replaced by trite
las. He fully appreciated the great
s shown by our designers in modern
buildings. But their appeal was
y discounted by the knowledge that
was a one-man art, and that they
nly realised at great cost by the un-
ing and uninspiring toil of unnamed
of workers. How different was the
sion conveyed by the Gothic building,
the whole structure seemed to have been
d by a band of intelligent craftsmen,
ontributing his share to the beauty of
hole! Such a building was a living
m rather than an academic composition.
, whatever kind of building we evolve
future, he thought it should be one
included in its scheme—as Gothic
did—that kind of happy human ex-
n of the creative instinct of the work-
which the classic tradition crushes out
tence. Having once rid ourselves of
ghtmare obsession of the masterpieces
past, and having given up all idea of
ng little Christopher Wrens or little
ngelos, we must next demand a
in our building by-laws which at
make cottage building impossible.
set of these rules to any beautiful Old
village and its beauty would melt
away. The overhanging gables and low-
led homely rooms of the farmhouse would be anathema. It seemed reasonable that architects who had made a special study of building should be allowed to frame their own rules and not be made to submit to regulations which were condemned by the better informed.

As an architect he found himself with a rooted prejudice in favour of beginning from the foundations upwards, and not from the roof downwards. Give him a universal and common speech of good building, without any architectural nonsense about it, which would lend a homely beauty to the rank and file of building, and then our great buildings would grow naturally out of that. In other arts the value of simple statement was recognised. Why, then, in building alone, in order to command the approval of the critics, was it necessary to be bombastic and diffuse, dragging in the spoils of Rome to give a kind of spurious exterior effect to a building whose real structure was ferro-concrete? Would it not be better for a change to give up the *rôle* of man, the imitative ape, and to take up the nobler and more difficult part of man

Stadt Stein, near Schaffhausen, Switzerland.

the creator? But probably the most essential reform required for the recreation of building as an art was the education of the craftsman by the formation of guilds, where art would be approached from the workshop and not from the art school with its dilettante methods. The art school had a way of spoiling horns without making spoons, and its academic traditions were fatal to that folksong kind of beauty which was once the possession of the people. Perhaps one of the latest survivals of this art was in the carving of the old figure-heads on our ships. How delightful it would be in our villages and old towns if, when a memorial was required for a street or square, instead of importing something trite and academic, we could produce locally a gaily-painted wooden effigy which would gain a new kind of beauty as its colours weathered! And then, suppose on entering the village church, if instead of seeing there the usual dull trade-carved figures on the chancel screen, designed by the eminent architect, we found there again the expression of this local art, bright with colour and gay as a wood in spring! This kind of art would mean far more than the varied interest it would give to our towns and villages, for it would stimulate that creative instinct so long stifled, and men would find joy again in the work of their hands.

FORM AND VISION WITH REFERENCE TO ART.

The seventh of the present series of Carpenters' Hall lectures on the Arts Connected with Building was delivered by Mr. W. S. Frith on the 6th inst. in the Hall of the Company, London-wall, Mr. Percy Preston, Past-Master, presiding.

Mr. Frith, whose subject was "Form and Vision—with Reference to Art," and who showed some excellent lantern views in illustration of his subject, said that in a work of art there might be said to be three principal factors—the thing seen, the person seeing it, and the technical qualities employed in representing it. If art could be exactly defined it would not be art, but science, and it must remain elusive. It was a record of thought and crystallised thought into a form which enabled it to abide with us and to be translated to others. By its art every nation had been judged, for it was felt to be a true index of its condition. All great art brought together its series of impressions, emotions, and experiences into a form which had the effect of removing the veil of extraneous matter that obscured the significant. Science and art, the two principal factors in intellectual development, constitute an interesting partnership, science having a tendency towards materialism, and art, appealing to the emotions and aspirations, had, unless a firm grip be maintained on things as they are, a tendency to become wild and visionary. Nature was the vast store from which art took such treasures as might be required for a definite purpose: if more was taken, it encumbered. Form was the subject of the sculptor's art, his theme being expressed by it. It was in proportion to the wisdom of his selection and his skill in developing and perfecting to express with grace and beauty that his art was vital or otherwise. In order to make a right selection of form the knowledge must be extensive, and a careful, exact, and prolonged copying of Nature essential, as well as reference to accepted masterpieces. But copying, and nothing else, brought into play mainly the more mechanical faculties, the eye observing equally the important and the unimportant, and there was a vital something missing. As science and art run together, so in art does imitation and invention, and, therefore, design should proceed together with copying, and the continual making of sketches in which the imagination could have full play would provide a sound balance. The making of these sketches would greatly assist the student in finding out what it was he must get Nature to teach him.

As to style, it was the tasteful and dignified delineations of the selected subject. But the word was used with reference to particular periods, and it was argued that in the present day, when photography had brought all these within our view, our conception of sculpture was confused beyond solution. There might, however, be the compensation that these varied manifestations of the spirit of the art should give us the opportunity of forming a wider and more comprehensive view—a vision that would include all, and from which a better understanding of the whole might enable a greater order to be evolved. The bringing out of the character was an essential part of art: it was the artist device of explaining to others what you see yourself. What was the lesson of historical styles? Why did these styles persist for a time and then die out? Was it the rule of Fashion? He was convinced the Greek copied Nature in the way experiences had shown him best, and that the Renaissance man was following what he thought the approved Greek method. There arose, however, the point mentioned in a previous lecture in that Hall—*i.e.*, that Greek art was founded on a geometric basis; while the art of the Renaissance was essentially on an anatomical basis. It was not, he thought, pointed out on that occasion that geometric did not only refer to measurement of masses—the correct proportion of the figure and its parts and the curves made by these—but also embraced surface measurement and proportion, and in this included the consideration of the proportions and character of the light-bearing and shadow-bearing surfaces. This was important, as it formed the principal link between sculpture and architecture. For instance, on a blank wall the light and shade of a piece of sculpture was free, but if architectural details, giving a definite scale, were within the visual area, the scale of light and shade in the piece of sculpture must be such as would form an agreeable harmony or contrast. This was the dominating general principle in architectural ornament, whether figure or foliage; when, however, he spoke of harmony it was in the musical sense in which a knowledge of harmony included a knowledge of nominal discords, which were probably the most beautiful parts, and those to which music owed most of its power of expression.

In viewing the path sculpture had followed in the past, it seemed to have started with making a mass indicating the rough outlines of the object, followed up in the direction of obtaining a more convincing likeness; this in time followed by an increased elaboration in the treatment of detail, exalting this at the expense of the more vital qualities, until this had overpowered or demeaned the work, destroying its appreciation at the same time as its high purpose. To those working in times when there was one accepted type of art this progression seemed to have been inevitable; but " with many types before us we may say there is no final style. And that the path for us is, while appreciating all that is excellent which had gone before, to be sure we see with our own eyes, and that we execute with the very fullest skill our hands can attain, the vision presented. See that the craftsman in you takes real joy in his work. What should he delight in if not in the successful exercise of those faculties with which he has been endowed ? "

CHURCH RESTORATION.

THERE was a good attendance of members at the meeting of the Nottingham Architectural Society, held at their rooms on Tuesday, February 27. In the absence of the President, Mr. E. R. Sutton, F.R.I.B.A., took the chair. After disposing of several business matters, Mr. A. I. West was elected an Associate member.

Mr. Wilfred Bond, Lic.R.I.B.A. and Architect to Croyland Abbey, then read the following paper on " Church Restoration; or Notes on the Repair and Refitting of Churches " :—

"There is no branch of the work of an architect which requires so much and so varied knowledge, or which calls for the exercise of so much skill and forethought, as the care of old churches. The architect requires accurate knowledge on matters structural, archæological, artistic, practical, and even legal. There is, moreover, no department in which his work is subjected to wider criticism. There is the criticism of architects and others who have really expert knowledge, which is valuable. Then the clerical critics, all of whom are deeply interested in the subject, and not a few have intelligently studied it and can assist the architect materially. There are a few, not often to be come across, but nevertheless in existence, who seem to think that their office and position constitute them authorities on church architecture. In such cases it is usually their only claim. Lastly, the general public, every one of whom is, or considers himself, quite capable of saying the last word as to what should or should not be done to his parish church.

The path of the struggling church architect is not a bed of roses, but, great as are the difficulties, the rewards, though unfortunately not financial, are equally great. The work is of the most absorbing interest and the study needful equally so.

In tackling the work at an old church the first and most important consideration is always the repairs to the actual fabric. These should be executed in the most conservative manner possible. Walls should be very carefully repaired and pointed and all cracks and voids well filled and grouted in. In most cases it will be found best to point stone walls with mortar composed of lias lime and coarse sand rather than with cement. Facing stones should only be renewed when their decay has gone so far that they are a danger to the stability of the wall. Stones frequently decay on the surface and then weather to quite a good hard face. Such stones can often be retained by weather-pointing the lower joint so as to keep the wet from penetrating the wall below. When a facing stone has decayed so far that its renewal is imperative it should be replaced with similar stone or a sound stone which will quickly weather to the same colour as the surrounding wall.

Good stone should invariably be used for repairing stonework, patching up with cement, or artificial stone, and plaster abominations should be avoided. I can never see why it is declared to be so wicked to repair stone with stone, but quite right to fake it up with cement or mortar and bits of tile. Where patching has been done in brickwork which is sound there is no harm, and often much advantage in not disturbing it—not that there is any real archæological value in a stone wall patched with brick; but it has generally weathered to a tint harmonising far better with the old stone than new stone would for many years.

Decorative stonework should, generally speaking, not be renewed except for constructional reasons. Where stones have to be replaced which have had carving on them those blocks should be left plain, as they were sometimes even in mediæval times, unless a really first-rate carver can be afforded. Good carving is never cheap.

The general dryness of walls can be improved by a concrete or asphalt channel round the outside with drains of socketed pipes to carry off the water. If common land drains are used care must be taken to keep them well above the foundations, otherwise the drainage of the subsoil will cause shrinkage leading to disaster. Such a channelling will often allow eaves gutters and rainwater spouts to be dispensed with. Where a dripping eave is possible it is much better without the hard lines of iron spouting. Besides, one of the last things churchwardens in the country seem to be able to afford is a little paint for eaves gutters.

Old roofs, generally of oak, require very careful repair. Many an old oak roof has been ruthlessly torn off and replaced by a mean and often gaudy pitch-pine one, when careful repair would have made it very nearly as sound as a new one.

Main timbers and tie beams can be carefully spliced, and the junctions of purlins and other timbers strengthened and secured by iron plates on their upper sides, secured by coach screws and concealed bolts without being unsightly. Even the most conservative repairer need not be brutal.

It is a great convenience in carrying out the repair of an old roof to erect an awning over it of tarpaulins, and the work can be deliberately carried out under it without pulling the roof more to pieces than need be.

I once saw a specification for the repair of an old roof, the first clause in which described that the contractor, before proceeding to repair, should carefully lay out in the churchyard all the timbers from the roof for the architect's inspection. The majority of repairable old roofs will hardly be likely to go together again if subjected to such drastic treatment.

Boarding should be renewed with oak boards of varying widths, and the flat surfaces of all the timbers may often with advantage be left from the saw or adzed and not planed; much of the old work will be found so treated. The lead should be recast and laid on deal boarding, and the sheets should be joined in the old manner with welts or hollow rolls, and not on rolls with a wood core. Floors should be carefully relaid on concrete beds and vaults filled up. Old brick or old tiles should not be discarded. They are often the original flooring, and if carefully relaid will make an excellent floor. It is difficult to match them, but if new of the same kind cannot be found the old flooring will probably be sufficient for some portion at least—say, the central abbey, and the sides can be made out with some other paving. Wood platforms are best laid with solid floors or wood blocks kept level with the alleys. It is well to take care that the concrete is good and has a layer of dry rubbish below if the ground is damp, or dry rot may be set up. The colour-wash on internal stonework should be carefully cleaned off with hard brushes, but not tooled or scraped.

Internal plastering should be retained. It is usually original, or has replaced earlier plaster. The XIXth-century restorer, in his terrible zeal for showing the construction, which he quite wrongly thought was invariably shown in mediæval work, said, " Plaster is a sham; let us get back to the good honest stonework "; and tore off the plaster together with the white-wash, often destroying valuable paintings lying between them. The colour-wash should be very carefully removed, so as to disclose any painting there may be on the plastering. Never straighten out new plastering, but have it done with short floats with a natural uneven surface, but without any attempt at studied roughness.

There has been of recent years a good deal of abuse of the professional architect and his methods of carrying out work in old churches. Our friends the builders have also come in for their share. The architect and builder are held up as scamps of the usual kind who, it is more than hinted, increase the cost and scamp the work for their own profit. The remedy for this disastrous state of things is said to be that the work should be undertaken by " young architects with a taste of construction," liv on the job and acting under the direction o certain London society, and done by d work. The advantages of this method of " o paying for the work done, no more and no les are hardly so attractive when you consider th you also pay for hire of scaffolding, often an enhanced price, from a local builder, or e purchase it and sell it again, and also purch the materials retail through an agent undoubted ability for the job; and the o guide towards the ultimate cost of the work the architect's approximate estimate.

The store of practical knowledge wh builders have and their commercial abili together with the skill of their specially trai and experienced workmen, is not a thing to lightly cast away. Where would Croyla west front be but for the wonderful mann in which John Thompson straightened The imputation that a builder will scamp t work in order to make it pay is a cheap sneer a body of honourable men. If people wou only employ reliable builders they have nothi to fear on that score, and we know fr experience that much church restoration done at little or no profit.

The disadvantages of contract by a lu sum can be got over by careful specificati of work, and in work where it is not possib to ascertain the exact amount by provisio sums or by schedule. This provides for ent elasticity for carrying out the work and making alterations as the work proceeds, t cost of which, as well as of any additio works, can be ascertained by the schedu One of the most interesting features of mediæ work is the local variations in different perio Ancient architecture may be compared to language with many dialects. This was d in some measure to the happy conditions wh necessitated building with materials most read to be obtained, which generally meant th close at hand. And still more was it the res of the working out of a design or scheme the local workmen. It was no time of work to drawings produced by eminent London arc tects, or jobbed by far-off assistants for lo practitioners.

The designers and workmen lived and work on the spot, and though, with the mod possibilities for travel, we can hardly hope get back to such a happy state of things, I think that the claims of provincial men to church work in their own locality is worthy more attention by those who have the direct of it. They live and work in the distri and are much more likely to appreciate a know local characteristics than the archite from a distance, however eminent. In middle of last century, nothing later th XIIth or XIIIth century work was more th tolerated, and XVIth and XVth conside debased, and as a consequence, perhaps, such a narrow view the great idea of chu restorers and their architects was to try exactly restore an old church to what th imagined it to be in the XIIth or XII century and fit it in harmony therewith, w the result that late Gothic work was frequen removed to make way for XIXth-cent reproductions of early features. We are sa now, and do not spend our time on " Norma fonts and pulpits " or " Early English " readin desks and choir stalls.

In the arrangements of the fittings of th chancel the chief difficulty to be faced is th accommodation has to be provided for ma people in the chancel than was probably th case when the church was built. The intro duction of surpliced choirs has made it th fashion for the singers to be accommodate in the chancel.

There have been attempts of recent yea to return to the west end position for organs an singers, reserving the chancel for the clergy an their immediate attendants. From an archi tectural point of view the gain to the church would be immense, particularly in small country churches. There are, however, practica matters which make such an admirabl arrangement impossible, particularly in thos places where there is least room. . . In al but a few special cases the choir and orga should be accommodated in or as near th chancel as possible. . .

Although many very beautiful reredos have been constructed, and the general effec is very fine, yet in the majority of cases i seems to be a mistake, and quite as effective a east end can be got by the old English arrange ment of a long altar with a comparativel

reredos, or a simple dorsal cloth or
r frontal with simple side curtains enclosing
altar, and suitable hangings or other
iments on the east wall. There is, of

to the fabric. These conditions, they
, must not be made by imitating the old
ng, but be frankly modern in style.
ounsel, whilst sounding plausible enough,
not lead very far, as we do not happen to
a modern style. It must be remembered
"Gothic" had never actually died out
before the "revival." The least harmful
od is to build simply the additions required,
g them distinctly subordinate to the old
ngs, having a care not to build meanly,
ith some of the spirit of the old work. The
of additions is best kept late rather than
in character. Early construction, to say
g of detail, is hardly possible now. Modern
ds and our modern state of hurry and
ience hardly create an atmosphere suited
mediæval manner.
very severe self-restraint is necessary
se who handle old buildings. There are
churches where all the merit of the careful
to the fabric and its seemly fitting has
poilt by additions bearing the emphatic
s of the too exuberant individuality of
chitect. In the fittings and wall decora-
considerably more freedom is possible,
e architect has his chance of designing
ful fittings and decoration, and unfor-
ly he too often comes in competition
he church shop or stores run by the
l tailor, whose obliging representative
vith equal celerity, measure the parson
air of bags and the church for a reredos
or a painted window. There are here and there happily those who care to have good craftmanship with suitable design, and one hopes in church work as in secular that they are increasing in number. The architect who aspires to work in old buildings must study them throughout, and especially inquire into the particular uses for which they were intended, as only thus can they be properly understood."

The Chairman having invited the visitors present to join in the discussion, Messrs. Gill, Hazell, Gascoyne, Taylor, Wright, Gleave, Dickman, and Spencer took part.

In reply to the discussion, Mr. Bond said he personally felt that it was quite allowable to put in parts of new glass to make good an ancient defective window if it were carefully done, and the same with regard to stone carving. At the same time it was far better to leave them blank unless you could do it properly. In answer to a question as to what period it was best to restore to, he said his rule was "always respect the best."

On the proposition of Mr. Sutton, seconded by Mr. A. C. Hazell, the heartiest thanks of the meeting were accorded the lecturer.

PRESIDENTIAL ADDRESS, DEVON AND EXETER ARCHITECTURAL SOCIETY.

At the annual meeting of the Devon and Exeter Architectural Society, on March 9, Mr. James Jerman, F.R.I.B.A., delivered his Presidential address, in the course of which he said:—

"There is one matter in the Report of more than ordinary interest. I refer to the part taken by some members of our Council, to whom I feel we are much indebted, in acting with the Committee of the Exeter City Council to revise the building by-laws. This co-operation on the part of the two bodies materially tended to elucidate many points of importance, and one gratefully acknowledges the courtesy of the authority and their responsible officials for seeking assistance of a technical character from those who have a desire and are in many ways responsible for faithfully complying with the important details of construction affecting the comfort and even the lives of our citizens.

Professional Work.

During the past year a marked endeavour has been made by the Royal Institute to come to terms with the Society of Architects on the subject of recognition and so pave the way to Registration. The work has been one of great difficulty, and matters have proceeded as far as the consideration of the amendment of the Royal Charter of the Institute to enable this desirable movement to be forwarded. One hopes that the present deadlock may be got over when the concessive spirit shown on both sides is generously regarded.

Many important matters are under the consideration of the Parliament of the Profession sitting in Conduit-street, and one of great concern to architects is the revision of the present scale of charges which has been in operation for such a long period. The altered condition of circumstances and the practice in the counties makes the revision not only desirable, but necessary. An official scale must have great weight with the general public, and should there be attached thereto, as is done in some countries, a code of professional etiquette, the result would not only be material but an influence for good in raising the tone of the members towards one another, as well as with the public employing architects. Such an official pronouncement will be of immense interest to client and architect alike in disposing of misunderstandings and clearly stating the position and duties of architects. The important question of copyright has also received attention at the hands of the Institute.

Professional Education.

The satisfactory position and the recognition of the examinations, as now arranged by the Institute, is a subject for congratulation, and puts the professional status on an altogether higher plane. The recognition of architecture as a part of the curriculum at many of our universities, by the granting of degrees, has strongly induced our students to take advantage of the splendid courses of study now provided at the University of London, University of Liverpool, the Architectural Association, and other institutions. Lastly, the students of our Society, preparatory to proceeding to the larger academical centres, can take advantage of the training supplied at our University College and the art department therein. With opportunities afforded in most of the chief towns in our district the earnest student can be prepared with facilities little dreamed of by some of us who had to work individually to reach the goal by a harder road.

Whilst referring to the subject of education I am tempted to say a word or two on the higher and after culture, so important to the uplifting of a learned profession. One deplores the falling off of the acquisition of archæological knowledge and interest amongst younger architects. The great impulse given to the study of our ancient buildings, more especially churches, during the wave of church restoration during the latter half of the last century acted in the most impelling manner in producing amongst architects many scholarly exponents of mediæval art throughout the country. The decline of this wave of restoration and the revived appreciation for classics and Renaissance traditions had decreased the flow of study, both amongst architects and the clergy, who had done so much in the past in instilling a love for the study of the beautiful buildings under their care. It may be hoped, however, that the newer interest may widen the whole sphere of art and produce even more enthusiastic exponents of historical study of this our elder art.

To advance the training of our younger brethren much might be done locally, and one would suggest, in addition to classics, lectures and visits to buildings under trained guides, that the Council, and others acting with them might draw up a list of buildings suitable for measured drawings and intimate study. For this purpose there are often charming specimens of minor construction, such as doorways, ceilings, mantelpieces, often available as examples of good work which might profitably be scheduled for attention where it is not possible to select complete buildings of any period. Photographs and descriptions could be prepared to enable the student to proceed without waste of time. In our own immediate neighbourhood of Exeter there is, of course, a wealth of good examples of almost every period and style, and the same applies in a lesser degree to the chief towns of our province. There are few places where some suitable example could not be found for study and measuring.

Schools of Architecture.

For some years there has been a fully-established school at Athens for the study of Greek architecture on the spot to supplement the preparation afforded by the Schools of Architecture in our own country. The great value of such study cannot be too strongly impressed on the student who desires to proceed on academic lines and draw inspiration from the highest types of classic work. Those of us who were privileged during our recent visit to Rome to see the British School of Architecture and Archæology established there felt that this school in Classic Rome completed a scheme for study on the lines of that already established by the French, German, and American architects, to whom their respective schools had been of inestimable benefit in advancing the genuine study of architecture. The generosity of the Italian Government, supplemented by the additional generosity of those who erected the building, in giving the site and building recently used at Rome for the Fine Arts British Exhibition cannot be over-estimated, and this further aid to study must have its influence for good.

Returning once more to the subject of the Society and its operations, the time appears to be at hand when more work will be expected of the allied societies and more responsibilities thrown on them by the Institute. The approval of applicants for admission to the various ranks of the Institute—especially that of the newly-created class of Licentiates—will require anxious and careful discrimination on the part of our Council, and it should be insisted that all local candidates should first be enrolled as members of our allied Society, for obvious reasons. With the greater interest in and the increasing knowledge of architecture on the part of the public we may legitimately say that the prospects of our profession were never brighter or better. This involves on our parts, both collectively and individually, a strenuous desire to uphold the best traditions of the profession."

THE PRUDENTIAL ASSURANCE COMPANY, LTD.

FROM the sixty-third annual report of this company we learn that the number of policies issued during the year was 60,012, assuring the sum of 5,396,721*l.*, and producing a new annual premium income of 325,699*l.* The premiums received during the year were 4,812 268*l.*, being an increase of 6,147*l.* over the year 1910. The claims of the year amounted to 3,423,273*l.* The number of endowment assurances matured was 20,862, the premium income of which was 119,586*l.* The number of policies in force at the end of the year was 901,693. In the industrial branch the premiums received during the year were 7,631,408*l.*, being an increase of 205,091*l.* The claims of the year amounted to 2,976,058*l.*, including 277,083*l.* bonus additions. The number of claims and surrenders, including 4,488 endowment assurances matured, was 373,641. The total number of policies in force in this branch at the end of the year was 19,041,748: their average duration exceeds twelve years. The assets of the company, in both branches, as shown in the balance sheet after deducting the amount written off securities, are 81,239,682*l.*, being an increase of 3,710,456*l.* over those of 1910. The valuation has again been made by Mr. Schooling. In the ordinary branch the surplus shown is 1,878,357*l.*, including the sum of 334,311*l.* brought forward from last year. Out of this surplus the directors have added 250,000*l.* to the Investments Reserve Fund, which, after deducting the 175,000*l.* written off value of securities, stands as at December 31, 1911, at 850,000*l.* In the industrial branch the surplus shown is 1,681,551*l.*, including the sum of 506,360*l.* brought forward from last year. Out of this surplus the directors have added 250,000*l.* to the Investments Reserve Fund, which, after deducting the 200,000*l.* written off value of securities, stands as at December 31, 1911, at 650,000*l.* The total surplus of the two branches, as shown by the valuation, is 3,469,908*l.* The directors are pleased to announce an increase in the rate of bonus of both branches of the company, as follows:—In the ordinary branch a reversionary bonus at the rate of 1*l.* 16s. per cent. on the original sums assured has been added to all classes of participating policies issued since the year 1876. This is an increase of 2s. per cent. over the rate declared for the past two years. In the industrial branch a bonus addition will be made to the sums assured on all policies of over five years' duration which become claims either by death or maturity of endowment from March 8, 1912, to March 6, 1913, both dates inclusive. This is an increase over the rate declared for last year of from 10 to 30 per cent. for all policies upon which over thirty years' premiums have been paid.

LAW REPORT.

KING'S BENCH DIVISION.

(Before Mr. Justice CHANNELL.)

J. A. Pratt & Co., Ltd. *v.* William Francis Frith.

THIS was a non-jury action in which Messrs. J. A. Pratt & Co., Ltd., of 43, Woodford-road, Watford, who are building material merchants, claimed an injunction restraining defendant, who carries on business as a timber merchant, etc., under the style of Messrs. Frith & Co., at Aylesbury, from breach of a covenant entered into between the parties.

Mr. Sanderson, K.C., and Mr. B. A. Cohen were for the plaintiffs; Mr. Clavell Salter, K.C., and Mr. B. Houghton appearing for the defendant.

The plaintiffs' case was that by agreement dated May 11, 1909, they engaged the defendant for five years, one of the terms being that Mr. Frith should undertake not to carry on or be engaged in business of a similar nature for five years after leaving the plaintiffs employ, within 8 miles of the company's head office at Watford, or within 2 miles of the branch depôts of the company at Harrow and Wealdstone, Sudbury, and Wembley, Amersham, Chesham, Boxmoor, Letchworth, and St. Albans. Messrs. Pratt & Co. determined Mr. Frith's employment during the spring of 1910, and it was now alleged that he had since supplied materials to, and canvassed orders from, customers of the plaintiffs.

The defence was that the plaintiffs had broken their contract in such a way that Mr. Frith was entitled to regard it as at an end, and that he was no longer bound by the restrictive covenant in question.

His Lordship heard considerable evidence, and eventually granted the plaintiffs the restraining injunction they asked for, with costs.

LONDON COUNCILS.

Bermondsey.—Plans have been passed for Messrs. R. L. Stuart & Sons, 194, Lower-road, Rotherhithe, S.E., for the erection of additions at 182, Lower road, for Mr. C. Offermatt; also for Mr. J. M. Kennard, architect, 13, Railway approach, London Bridge, S.E., for the erection of a building in Corbetts-lane, Rotherhithe.

Brentford.—The tender of Messrs. George Wimpey & Co., at 485*l.*, has been accepted for paving Ferry-lane.

Chelsea.—The tender of the Improved Wood Pavement Company, Ltd., has been accepted for paving a portion of Chelsea-embankment with 9-in. wood blocks, at an estimated cost of 11s. 10d. per yard super., the Company to maintain the paving free of charge for a period of three years.

Friern Barnet.—The tender of Messrs. Grounds & Newton, at 3,223*l.*, has been accepted for making-up Torrington Park. Plans and estimates have been approved for making-up Friern-lane at an estimated cost of 1,398*l.*; also for making-up Hollyfield-avenue. Plans have been passed for Mr. W. J. Warren for six houses in The Crescent.

Hendon.—An estimate by the Surveyor (692*l.*) has been approved for kerbing, channelling, and making-up the foothpath in a portion of Daws-lane, Mill Hill. Plans and estimates are to be prepared for making-up a portion of Hamilton-road. At an estimated cost of 703*l.* the last portion of Russell-road is to be made up. The following plans have been passed:—Messrs. William Moss & Sons, seven houses, Hammers-lane and Wills-grove, Mill Hill; Mr. A. J. Reynolds, four houses, The Ridgeway; Second Hampstead Tenants, Ltd., flats, Addison-way; Mr. J. Webb, four houses, Hallswelle-road; Mr. W. T. Streather, twelve houses, Ella Russell-gardens; Messrs. Hamiltons, six shops, Hamilton-road; Kensington Freehold Land Trust, garage, rear, The Promenade, Lawrence-hill, Mill Hill; Messrs. Haymills, four houses, St. Dunstan's-road, Golder's Green.

Hornsey.—Plans have been passed for Messrs. Cheritons, Ltd., Hampstead, to enable them to make alterations and additions to the Bakery at No. 6, The Broadway.

Lambeth.—300 ft. of the sewer in Ship-lane is to be relaid in 9-in. pipes at an estimated cost of 210*l.* The whole of the sewers in the neighbourhood of St. Mary's-square are to be relaid. During the ensuing year paving and repairing, etc., works are to be carried out in the borough at an estimated cost of 35,788*l.* A plan has been lodged with the London County Council by Messrs. J. A. J. Woodward & Sons on behalf of Messrs. J. Dennis and H. Ryland, for the erection of seven houses in Dolland-street.

Poplar.—The sewer from East India Dock-road to High-street is to be reconstructed with 12-in. and 6-in. pipes at an estimated cost of 576*l.*

Rickmansworth.—Plans have been passed for Mr. Fred Franklin for twelve cottages, Mill End, and for Messrs. Benskin's Watford Brewery, Ltd., for alterations to Western Inn, High-street.

Watford.—Plans have been passed for Mr. J. Giffin for the erection of three houses in St. Alban's-road; also for Mr. F. Fisher for shops and offices in High-street and King-street.

Wimbledon.—The Borough Surveyor has been directed to prepare plans and estimates of the cost of paving the margins of the carriageways of Worple-road, Hill-road, The Broadway, and part of Merton-road with wood blocks. A portion of the footpath in Worple-road is to be paved with concrete slabs, at an estimated cost not to exceed 294*l.* The Open-Air Swimming Bath Committee have decided to make application to the Local Government Board for sanction to borrow 1,650*l.* for the construction of an open air swimming-bath. The following plans have been passed:—Messrs. G. Baines & Son, church school, Quicks road; Mr. W. T. Tanner, additions to "Helena," Alan-road; Mr. R. J. Thomson, additions to "St. Aubyns," Grosvenor-hill; Messrs. W. & C. Brown, Ltd., additions to factory of the British Incandescent Mantle Company, Ravensbury-road; Mr. E. T. Manley, six shops, Durnsford-road. Plans have been lodged by Mr. R. J. Thomson for five shops and offices in Hartfield-road.

FOREIGN AND COLONIAL.

Building in Austria-Hungary.

The *Zentral Anzeiger für das öffentliche Liefcrungswesen* (Vienna) of February 1 states that the municipal authorities of Brixen recently decided to erect an infirmary in Brixen at a cost of 1,530,000 kronen (about 63,700*l.*). The municipal authorities of Kassa have also arranged to build a hospital there at a cost of 1,600,000 kronen (about 66,700*l.*). The hospital is to have accommodation for 400 beds.

Water Supply, etc., Roumania.

The *Monitor Oficial* (Bucharest) of February 18 publishes a copy of a Bill presented to the Roumanian Legislature for the grant to the municipal authorities of Tulcea of powers to contract a loan of 1,600,000 lei (64,000*l.*), two-thirds of which amount it is proposed to devote to supplying the town with drinking water, and with a drainage system, and the remainder to be applied to the erection of schools and other buildings.

Street Construction, Building Material, etc., Argentina.

The *Boletin Oficial* of February 2 publishes the text of a Law (No. 8,854) declaring the necessity for constructing in Buenos Aires an avenue nearly 100 ft. wide to run from the junction of the Calle Rivadavia and Calle San Martín as far as the junction of the Calle Libertad and Calle Lavalle, together with the erection of buildings on each side of the proposed new thoroughfare. In order to carry out this enterprise the municipal authorities of Buenos Aires are empowered to contract either an internal or external loan amounting to 15,000,000 pesos gold (3,000,000*l.*).

PATENTS.

APPLICATIONS PUBLISHED.*

27,937 of 1910.—Wilhelm George Henry Browne: Slop grate or dish for gullies.

3,861 of 1911.—Herman Meyer Braun and Isaac Diamond: Securing and retaining devices for doors and the like.

3,923 of 1911.—Walter Lees, Thomas William Lees, and Archibald Lees: Apparatus for heating buildings and the like.

4,693 of 1911.—Walter James Emms: Gas-heater for hot-water systems, applicable for use with closed kitchen ranges, greenhouses, and for other similar purposes.

5,136 of 1911.—John Doyle: Isolating screen for rooms or compartments in hospitals, public buildings, and the like.

5,510 of 1911.—Samuel Henry Adams: Manhole covers.

9,178 of 1911.—James Henry Bennetts and George Richard Leadsom: Apparatus for operating casements, fanlights, and the like.

9,899 of 1911.—Adrian Eugene Lundstrom: Rising hinges.

10,028 of 1911.—David Mein Nesbit and Ashwell & Nesbit, Ltd.: Radiators for heating buildings and the like, and fittings for the same.

14,197 of 1911.—William Henri Luther: Roof lights and the like.

18,398 of 1911.—Friedrich Ernest Benzing: Controlling door-lock

21,564 of 1911.—William Henry Colwill: Cowls for chimneys and ventilating shafts.

24,822 of 1911.—Allan Keene Pruden: Metal buildings or constructions.

27,157 of 1911.—Alexander Reid Mauson: Roofing materials.

28,755 of 1911.—George Albert Chaddock: Windows.

28,756 of 1911.—George Albert Chaddock: Windows.

LANGHOLM WATERWORKS.

The Local Government Board have sanctioned the scheme prepared by Mr. Harry W. Taylor, Assoc.M.Inst.C.E. (Messrs. Taylor & Wallin), Newcastle-upon-Tyne and Birmingham, for the augmentation of the water supply of the Burgh of Langholm. By this scheme additional springs in the Ewes Water Valley will be tapped, a new reservoir built, and the distributing in the town considerably improved. The cost is about 6,000*l.*, and the work will be commenced at once.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number**: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, —; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

ARCH 15. — **Drammen, Norway.**—RAILWAY-ION.—Particulars from the Norges Statsr, Christiania.

ARCH 15. — **Prestatyn, North Wales.** — ING-OUT ESTATE.—Lord Aberconway and the stees of the Prestatyn Estate invite designs laying-out of the estate Three premiums offered. Particulars from 33, Henrietta-et, W.C. See advertisement in issue of nary 5 for further particulars.

ARCH 16. — **Harrow.** — PUBLIC OFFICES.—The row-on-the-Hill U.D.C. invite tenders for the rgement of and alterations to their Public ces. See advertisement in issue of January 5 further particulars.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B. Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

BLACKWOOD.—For erection of a new mission hall, for the rector and churchwardens of St. Margaret's Church, Blackwood. Mr. A. F. Webb, M.S.A., architect and surveyor, Blackwood:—

From the designs of Mr. W. Flockhart, F.R.I.B.A., in conjunction with Messrs. Lemon & Blizard, FF.R.I.B.A.

The illustration above and the plate reproduction show the appearance since it was altered of the Union-Castle Steamship Company's Offices at Southampton. Particulars of the work appeared in our issue of December 22, 1911 (page 735).

REINFORCED CONCRETE IN ARCHITECTURE.

THE strivings of Continental architects for originality in the way of reinforced concrete architecture ve given birth to designs which are tesque or merely fanciful according national temperament and feeling, and efforts of American architects to lve a distinctive style for reinforced crete have not been more successful n their preceding attempts to do the ie thing for structural steel.

British architects have been content, our opinion very wisely, to play the ting game and to abstain from the eavour to create a new architectural e by the simple but unproductive hod of sitting down and trying to lve one by inductive reasoning. A n might just as well place himself, cil in hand, before a drawing-table, ing, "Now I will invent something." annot be too clearly recognised that in architectonic as in constructive problems "Necessity is the mother of invention."

This fact at once suggests the question whether an original style for reinforced concrete is actually necessary. Let us, then, consider briefly the form and attributes of reinforced concrete as manifested by familiar structural members. Apart from its outer texture, a reinforced concrete column only differs from a stone or timber column in the respect that its transverse dimensions are relatively small, and the difference is similarly limited in the case of a beam, corbel, or other member subject to flexure, and in the case of an arch, vault, or structure of like nature. Hence the only suggestion made by the mechanical properties of reinforced concrete is that structural members and elements formed of the material may be somewhat more slender for equal duty than kindred members and elements of stone or timber. Therefore, from this standpoint reinforced concrete does not suggest a new architectural style or any new form of architectural detail.

We often hear the dictum that reinforced concrete architecture should express the distinctive characteristics of the material. We have already dealt with these from the standpoint of construction, and have now only to consider them architecturally. To begin with, the steel used as reinforcement is always out of sight, and, being quite inexpressible, nothing is left for expression but monolithic concrete.

In order to facilitate matters, we will set down the only features capable of being brought out in reinforced concrete design. These are:—

(1) Relative slenderness of construction.

(2) Monolithic continuity.
(3) Natural texture of concrete.

Relative slenderness can easily be revealed by the designer in the case of columns, beams, and various other members, but there is no possibility of causing the outer surface of a wall to indicate the thinness of the material, except at window and other openings, where close inspection may facilitate discovery of this feature.

Monolithic continuity can readily be denoted by avoiding all appearance or imitation of the joints, courses, projections, and lines fulfilling structural requirements in stone and timber buildings.

The natural texture of concrete, which, of course, may be varied by using sand and aggregate of different tints and degrees of fineness, can be expressed by the simple expedient of leaving the surface exposed.

These three modes of expression certainly do not carry the need for, or the slightest hint of, a new architectural style, while they do suggest the unwelcome thought that the most beautiful traditional forms of architecture are not well adapted for reinforced concrete, or *vice versâ*, as the reader may prefer. We should not like to state this thought as a definite conclusion, for it is quite possible that increasing familiarity with construction in the new material may ultimately lead modern architects to the gradual adaptation of accepted forms, or the evolution of new forms, which will make reinforced architecture an accomplished fact. As far as we can see at present, however, this desideratum will be the result of artistic genius, and not the direct outcome of distinctive characteristics exhibited by the material in question.

Familiarity with construction as a first step towards characteristic design in reinforced concrete is not encouraged by the procedure too largely followed to-day. Sometimes the architect only decides upon the adoption of reinforced concrete after a building has been designed on lines expressive of masonry pure and simple. The Y.M.C.A. Building in Manchester is an example, where, as stated by the architects, reinforced concrete was adopted as an afterthought owing to its convenience and structural advantages. Again, it often happens that the architect evolves his design and then enlists the co-operation of a commercial, or semi-professional, specialist to furnish working drawings of the reinforced concrete details. As the specialist is almost invariably an engineer rather than an architect by education and training, and as the commercial side of his calling predominates, he is not qualified and does not think it politic to make suggestions on points affecting architectural design, and so is not an ideal collaborator.

Instead of following either of the foregoing methods, which we believe to be merely tentative and temporary, the architect should, after forming a general idea of the accommodation to be provided by and the proportions of the proposed building, sketch out for himself the reinforced concrete skeleton and enclosing walls in accordance with constructive principles and conforming with any selected architectural style. The treatment of details and the evolution of appropriate decorative effects will then follow in natural sequence, and the work of the reinforced concrete specialist will be limited to matters of practical import.

By proceeding thus, the architect may be enabled to break away from the common practice, evidenced in connexion with steel as well as with reinforced concrete, of creating buildings which purport to be masonry structures, but in reality are skeletons of other materials simply masked by a skin of masonry.

We do not say that a masonry-faced skeleton necessarily constitutes bad architecture, for it must be remembered that many fine ancient buildings, among which the Colosseum may be cited, are of brick faced with stone, and that numerous modern buildings of unquestionable merit have been similarly treated, the stonework fulfilling a requirement that could not be satisfied by the brick or steel which it hides. Nevertheless, our point remains that the method of sheathing reinforced concrete in this manner, and thereby treating it as a purely structural material, can never induce its adaptation to architecturally traditional forms or to the evolution of a new architectural style.

Reverting to the proposition that the architect should learn to think and design in reinforced concrete if that material seems best fitted for the work in contemplation, we may usefully point out that while reinforced concrete is excellent for ordinary structural members, it is not always satisfactory in the form of thin exterior curtain walls owing to the tendency of these to develop small cracks, which, although quite unimportant structurally, are very undesirable architecturally. This characteristic leads to the favourable consideration of an alternative method embodying the construction of a reinforced concrete skeleton supporting brick or stone walls, but left exposed as an essential feature of the architectural composition, displaying honestly the structural duties performed by, and the real surface and texture of, the reinforced concrete work. The exterior of a building so designed, with reinforced concrete columns connected by beams, lintels, or arches, and the addition of porches, doorways, balconies, window-frames, and other details, would be completed by brick or stone curtain walls, with such decorative treatment as the architect might consider appropriate. The conception is not original, and merely embodies an idea which is an essential feature of early English architecture, and to which reinforced concrete may be applied just as appropriately as oak or timber generally. Moreover, the general principle is one capable of extension to other styles of architecture.

On the whole, it seems probable that the best method of dealing at present with reinforced concrete may be, as proposed not long ago by Professor Beresford Pite, "the employment of traditional architectural forms, suitably modified for execution in concrete." But we look forward with confidence to a further advance in the future as architects gradually bring the influence of their art to bear upon a comparatively new material and method of construction.

Those who hope to create an entirely new form of architectural design for reinforced concrete may be reminded that in the beginning architecture was the result of construction practised during preceding ages and intended to provide solely for physical needs. We cannot in the present age expect to attain success by attempting to reverse this natural system of evolution by seeking to model typical construction out of a mere architectural conception. Nor can we arrive at a new architectural form without the solid foundation of approved construction. So long as reinforced concrete building construction, as practised by commercial firms, has no independent existence, and merely follows the lines set by architects who, perhaps with a few exceptions, make no attempt to design *per se* in reinforced concrete, we cannot expect to witness the growth of a special architectural form for that material. The only way in which such a form can be created is for architects to deal first with the problem of construction, and then to seek artistic inspiration from the result achieved.

NOTES.

The East Sussex Hospital Competition.

In a letter to the *Hospital* endorsing the opinion that awards in recent competitions, such as the Hastings Hospital, have undoubtedly displayed a total disregard of the practical work for which hospitals should be designed, Mr. William Herman raises an important point of competition ethics. It may be magnanimous, he thinks, on the part of competitors to invariably accept the assessor's award without complaint; "but is it in the true interests of the public or of the architectural profession?" In other words, is it treating the public quite fairly if when a mistake is made those in a position to know allow the public to be deceived and to imagine that they are getting the best design? The public puts confidence in the profession and trusts to it to select the best design. This confidence is seldom misplaced; but assessors being only human, mistakes must sometimes occur. Should one be made, and be deliberately hushed up, would the public be entitled to call this a breach of confidence? If a code of professional etiquette renders such deception necessary, is that code a sound one? We quite see the difficulty. Everyone wishes to play the game, and long may the wish prevail; but, nevertheless, the public may not see why they should have to put up with a bad building in order that architects may pride themselves on being good sportsmen. Neither should there be any danger that the sporting manlike instincts of the competitors might be traded upon to bolster up any particular system of assessing, nor should the competitors be forced to choose between their loyalty as citizens or as professional men. It is certainly a question whether the erection of an inferior and inadequate building does not lower the profession in the eyes of the public more than the acknowledgment and rectification of an unfortunate

ake, and whether true loyalty to profession would not choose the r evil. We are, however, entirely sed to the reopening of competitions ublic, but, all the same, a position h should never have arisen should be allowed to continue. Where ion is necessary it should be by operly-constituted professional tri-l. The Competitions Committee of nstitute might perhaps be strength- for this purpose.

hitecture Window-reaking. If the smashing of the largest available sheet of plate-glass is to become the recognised method of g attention to grievances of every iption, great changes may be ex-d in the architecture of our shop s. Smaller panes may again come use, and the æsthetic problem of the plate-glass window be solved or r smashed by the hammer that lates a grievance and a shop with low. It is just possible that many rchitect whose æsthetic arguments failed to make an impression on d-headed race of shop-keepers may with complacency that produced ne weightier and more convincing nent of the hammer, and be led by to admire the way in which all s work together for good. Or will e triumph over reaction with a t hammer-proof glazing, and save om designing down to the level ur most downtrodden and from rating once more the well-worn n that art reflects the manners—ck of manners—of the times and t advance beyond them? If our ms are to be reopened, with their nts protected from the fate which ook the Portland vase, some such tion seems needed. But although, e meanwhile, where museums are rned, it is easy to protect the 's art treasures from the too siastic admiration of some of their 's by the simple expedient of shut- the doors, are there not bronze coated warriors and politicians ing our streets, priceless relics of olden age of early Victorian art, stand unprotected at the mercy of ammer? They may not be so easy eak as a Tanagra figure, and there- may escape, but iron on hollow e makes almost as soul-satisfying nd as on glass, so let the authorities e.

London Museum. It is uncertain when the London Museum, which the King visited yesterday, e opened to the public. The un-ble attentions of the window ers are feared. But when the day architects will find among the collected many objects of interest. ngton Palace and Wren's Orangery nt are themselves attractive, but ntents of the former building and ne new annexe claim a special nage. In the Royal Palace are ed innumerable relics of London ner days, including topographical ap engravings, Hollar's delightful colour of "Westminster Abbey," th's oil, "Southwark Fair," and of Mr. Norman's drawings. It is, er, in the annexe that most of the objects of architectural importance are housed. We do not refer particularly to the old Roman boat, found on the site of the County Hall, to the prison cells from Wellclose-square, or to the various excellent models of old buildings, all of which are valuable from a constructional and historical point of view. We direct attention rather to the structural and decorative relics which have found their way appropriately enough into the new Museum. There are balusters, over-mantels, a balustrade by Inigo Jones from 32, Lincoln's Inn-fields, less solid but more ornamental staircase fittings from 2, Portsmouth-street, Lincoln's Inn, and from 34, Redman's-row, Stepney, wooden doorways, linen-fold panelling, and four fine oak corbels from a house in Wandsworth. These are a few of the things which make the annexe instructive, and architects will contrive, no doubt, to supplement them as opportunities occur.

Ecclesiastical Metalwork. Some excellent hand-wrought ecclesiastical metalwork, made by the Duchess of Sutherland's Cripples' Guild, is now on view at 13 and 14, New Bond street, London, W. The Guild was founded some twelve years ago by the Duchess of Sutherland for the purpose of giving employment to crippled lads. It sought to develop their artistic instinct, and to teach them, sorely handicapped as they were, how to lead happy and useful lives, rather than to look for and lean upon charitable relief as the only mitigation of their sufferings. The work on view and for sale at the London depôt proves that the experiment has been more than justified, and these lads bid fair, in spite of adverse conditions, to rival in their productions the delicate artistry of past centuries. The Guild are workers in gold, silver, copper, brass, and silvered copper and enamels, and they can execute architectural fitments, repoussé work, etc. The work of the Guild is deserving of the support of the profession and the public, and we have pleasure in calling attention to it.

The French Ministry of Fine Arts. A new Under-Secretary of State for Fine Arts has been appointed in France. His name is M. Léon Bérard; he is thirty-six and a successful *avocat*; he has also been a Deputy since 1910. He has, further, occupied the position of a former private secretary to the present Prime Minister. According to the *Temps*, he has had something to do with men of letters and artists generally. His qualifications for his present position would therefore seem, on the face of it, somewhat negligible; and a similar appointment in England would no doubt encounter a good deal of criticism. But in France the position of art is held in higher general estimation than here. It would be difficult to find in that country a man who possesses the qualifications of a barrister who does not also possess the respect common to his countrymen for artistic effort. Apart from that, his position as a barrister in the social economy is certainly not higher than an artist's; a man who professes law gains no more respect from his fellow-man than he who professes art. In these circumstances there is something to be said for the appointment of a man with a legal training. He may be able to balance issues with greater nicety and to distinguish with some discernment the various values of expert advice which it will be necessary for him to seek in the employment of his office.

[This is an illustration of the plumb-rule used in laying the foundation-stone of the L.C.C Hall. It is the work of the Bromsgrove Guild, who also made the mallet, the level, and the bronze casket in which the coins and documents deposited under the foundation-stone were placed.]

ROMAN REMAINS IN BRITAIN.

Professor F. J. Haverfield lectured on "The Discoveries of Roman Remains in Britain in 1912," at the British Academy recently, and in the course of his remarks he said there had been only one excavation on a great scale in 1911, that of Corbridge. Silchester and Caerwent were now finished for the present; Verulam had fallen through; Wroxeter, though in active preparation, had not yet been begun. Instead, there had been a most regrettable mass of more or less abortive work—excavations planned but never commenced, or commenced with imperfect means and inexperienced supervisers, or left for years with their results undescribed. The last year or so had seen much of this, and it did no honour to British archæology.

GERMAN EXCAVATIONS AT MILETUS.

The Berlin Correspondent of the *Times* writes that Dr. Theodor Wiegand, the Director of the Berlin collections of antiquities, recently gave an account before the Prussian Academy of Sciences of the principal results of the recent German excavations at Miletus and on the site of the neighbouring Temple of Apollo at Branchidae. After some account of the work on the prehistoric settlement of Miletus he described the good progress made with the excavation of the Hellenistic town. A building of delicate Corinthian work has been brought to light in the south market. The clearing of the Serapeion has been completed, and the fragments of the entablature and pediment of the entrance hall of six columns can be pieced together. A copy of the head of the Canachus Apollo was found on the site. North of the Serapeion and west of a street which continued the line of the Sacred Way the excavators have traced a rectangular peristyle court with an *exedra* and a gymnasium or a small *palaestra* to the south of it. On the neighbouring site of Branchidae five more of the seated archaic figures have been discovered on the line of the Sacred Way. The eastern half of the great Temple of Apollo has been completely cleared.

C

THE usual fortnightly meeting of the Royal Institute of British Architects was held at No. 9, Conduit-street, W., on Monday, Professor R. Blomfield presiding.

Mr. H. T. Hare announced the decease of Dr. Phené, Fellow, elected in 1872, and a vote of condolence was passed to the relatives.

Mr. W. H. Ward then read a long paper, of which the following is an abstract, on

THE ARCHITECTURE OF THE RENAISSANCE IN FRANCE.

"No country outside of Italy made the teaching of the Renaissance in architecture so thoroughly her own as France.

By the time Francis I. came to the throne on January 1, 1515, Renaissance forms had become acclimatised. Though Italians were still frequently employed, the French builders had acquired some skill in the new style. The result was that a number of buildings began to arise, which have been characterised as French construction in Milanese dress. The qualities which charm in this style, the style of Francis I. as it is called, which prevailed roughly from 1515 to 1540 or 1545, are its picturesque and somewhat haphazard grouping, its ingenious use of Italian motives to clothe native building forms in a delicate embroidery of ornament. The early Renaissance was not always smiling, and we see it in a more serious mood in the castle of St. Germain, largely rebuilt by Francis I. about 1540. Yet we must not expect from it the highest achievements of which architecture is capable. The art of composition was in its infancy. But some time before the end of Francis I.'s reign, from, say, about 1530, a new type of design began to come into competition with that which bears his name.

Up to this point the architect in the modern sense had scarcely emerged. He had hardly disentangled himself from the master mason, the master carpenter, and the clerk of works. From this time onwards a new generation of men arose, whose training was theoretical as well as practical, men like Philibert de l'Orme, Jacques Androuet du Cerceau, and Jean Bullant. This brought about one side of the change. The other was due to the new sources of inspiration, for both the young French architects and the Italians whom Francis continued to attract to France were now imbued with the ideas of the mature or Roman phase of the Renaissance. The effect was soon seen in schemes considered as a whole from the start, in a broader manner, a greater regularity and symmetry, in a more systematic use of the Orders, and a more scholarly treatment of detail, as well as in the shedding of much mediæval practice, particularly such as related to fortification. At the same time, much that was both national and picturesque was retained. There had thus been evolved an architecture which, if it still bears upon it both the faults and the charm of youth, may yet be regarded as having reached the first stage of maturity. France, within the middle years of the XVIth century, had arrived at a style based on the classic code of forms and composition, which suited her then requirements.

Renaissance architecture in France may be said to have reached, in the mid-XVIth century, a stage of at least incipient maturity, not only as regards the character of its buildings *per se*, but because it already contained, either in germ or fully developed, nearly all the elements which went to the making of subsequent styles. But in each country of Europe it seems that some untoward circumstance was destined to arrest the flow of Renaissance development, or at least to check it for a time, with the result that, when it was released once more, the environment had sometimes become less propitious. In France the life of the nation was absorbed for a generation in the Civil Wars, which raged intermittently from the death of Henry II. in 1559 to the final recognition of Henry IV. in 1596. The two centuries which followed, from the reorganisation of France as a centralised State to the Great Revolution, coincided with the rule of the Bourbon dynasty, and witnessed the growth, culmination, decline, and collapse of Absolute Monarchy. The architecture of this period is essentially one, though it passes through various changes of taste, affecting principally the decorative system. It represents the full maturity of Renaissance architecture in France in various moods; and these moods reflect the changing conditions of society and politics, thought and literature. They may be roughly grouped under the names of the four Louis whose joint reigns cover all but the first fifteen years of the period. Though the style of Henry IV. is a recognised designation, it is practically indistinguishable from that of Louis XIII. It is only a little less formed. The culmination of the Louis XIII. manner may be placed about 1630, and its influence is traceable here and there in the provinces almost to the end of the century. But long before the death of Louis XIII., in 1643, a different spirit had begun to come over architecture. Architectural studies having been neglected during the later years of the Civil Wars, the architectural profession was rather at a low ebb, and suffered from a dearth of capable men. With the XVIIth century, however, classical studies revived. The reign of Henry IV. produced some notable works rising above the general run of coign and panel architecture. The junction of the Louvre and the Tuileries elicited dignified architectural efforts, whose authorship, however, is still shrouded in some obscurity. But the first quarter of the XVIIth century produced one architect of great talent in Salomon de Brosse. As a grandson of Jacques Androuet du Cerceau, and nephew of the latter's two sons, who were all architects in the Royal employ, he inherited a high tradition of design, and was well fitted by his training, as well as by his position as First Architect to the Crown, to sum up in monumental works all that was best in current methods, and add to them a touch of classical dignity. De Brosse, however, remained a little heavy, even when at his best. But the classicising tendency, the first symptoms of which reappeared in his work, was maintained throughout the succeeding period from 1624 to 1661. The greatest architect of the XVIIth century was François Mansart. In his early Château of Balleroy, begun in 1626, we find him using, but using finely, the "chaîne" and coign system of the day. But in the work carried out by him at Blois between 1635 and 1640 for Gaston of Orleans, though it is obviously reminiscent, in plan and general grouping, of the Luxembourg, he strikes a new note of stateliness, and shows a new sense of scale. But there is still a trace of the heaviness typical of the Louis XIII. manner. All heaviness has entirely disappeared from his work in the noble mansion of Maisons, begun in 1642. Having reached this degree of consummate accomplishment, Mansart maintained it till the end of his career. That among architects Mansart was not an isolated case is proved by an examination of the great buildings of the last years of Mazarin's life. The charming Hôtel de Beauvais, in Paris, built in 1656, is a standing illustration of that same ideal of perfection of form which pervaded the thought of that age.

The contemporary Château of Vaux-le-Vicomte is of great interest from several points of view. Nicolas Fouquet, the minister who hoped to succeed Mazarin, determined to have the most sumptuous mansion of the age. His architect was Louis Le Vau, who was to continue the Louvre, complete the Tuileries, and begin the transformation of Versailles. His decorator was Charles Le Brun, who was to reign supreme over the decorative arts for a generation. His estate was laid out by André Le Nôtre, whose word was to be law in garden design throughout Europe for nearly a century. Le Vau's work, while never reaching the supreme accomplishment of François Mansart, and less certain in a sense of scale, is always dignified an often touched with some degree of imagin tion.

Up to the 'sixties the chief glories XVIIth-century architecture are the sum tuous mansions in town and country in whi the nobles embodied their uncurbed amb tion, as well as their cultured tastes splendid patronage of art. The next thi gave birth to Versailles and the Invalides, splendid palaces and pompous monumen The change is symbolised in the very char ter of the architecture, as well as the p poses to which it was applied. Before, have multiplicity; after, unity. Befo great buildings are broken up into pavili and galleries, with roofs of varying heig and important dormers, and small Orde prevail; after, we have single unbrok masses, continuous or concealed and bal traded roofs, and colossal Orders. Fouquet's fall the group of artists he gathered round him was set free to se Louis. Le Vau and Le Nôtre and Le Br were set to work to transform the ro châteaux into palaces worthy of the gr King. What Le Nôtre did for garden sign was in accordance with the whole tre of the age. He unified and centralise The genius of Le Brun, though he was mean artist, manifested itself likewise chie in organisation, in the success with which gathered together an immense personnel artists and craftsmen of every descriptio native and foreign, and turned their vari aptitudes to account. Of Fouquet's trio o Le Vau, though a very capable archite failed to be quite equal to the spirit of time. His design for the east front of Louvre, conceived on traditional lines, shelved in favour of Bernini's and eventua Perrault's, and his chief activity was tra ferred to Versailles and the Tuileries. advent of Bernini among the French arc tects in 1665 to design the east front the Louvre was the touch needed from o side to precipitate the transformation towa which all things had been moving. Bernin design, whatever its defects—and it is c tainly a fortunate escape for Paris that was not carried out—had the merit of str ing a single unmistakable note. If change in the aims of architecture was all respects a gain is open to question.

The stage which classical architecture France had reached after a century and half of experiment now crystallised, and perpetuated till the Revolutionary era the precept and example of the Academy Architecture founded at this time und royal auspices. This stage may be describ as a kind of free Palladianism based on stu of the antique and of the Italian writers the XVIth century, but it did not dema slavish or pedantic imitation; it had the a septic of common sense. Its chief spokesm was the elder François Blondel, the arc tect of the Porte St. Denis, and its ch exponent, Jules Hardouin Mansart.

Jules Hardouin Mansart, great-nephew François Mansart, who succeeded to the p of architect to all the royal buildings at Vau's death in 1670, was wholly of the n way of thinking. At Versailles he was han capped from the start, and his efforts redeem the scale were doomed to at le partial failure. The transference thither the seat of government, as well as of Court, necessitated enormous increase accommodation. Circumstances obliged Ma sart to obtain this by throwing out vast wings north and south in such a man as to leave Le Vau's work as an unsa factory central projection, which has b the butt of criticism ever since. None have felt the ineffectiveness of this arran ment more than he, but even Louis XIV megalomania must have recoiled from colossal expense of the only course wh could have obviated it—the building of gr terminal wings of equal or greater projecti

Le Brun died in 1690, but his influence h waned before that, and a lighter, more pl ful manner had begun to be visible in works of Bérain and other contemporary signers. J. H. Mansart himself began modify the solemnity of the interiors designed. A new age was at hand. In 1 the old King died unregretted. His s cessor was a child, and the seven ye Regency of Philip of Orleans flashed past a whirl of frivolous and profligate gai

le western suburbs began to be covered
th a host of new "hôtels" by all the
shionable architects of the day, among
om were Robert de Cotte, Mansart's son-
law and partner; Cailletau, his assistant;
d Jacques Jules Gabriel, his relative and
ordinate in the royal works.
The architecture of the first half of the
VIIIth century maintains as a whole the
ssive monumental character and relatively
er classicism of the late XVIIth. The
tlessness of the reaction from the previous
omnity appears almost exclusively in
tters of detail, in that same revolt from
supremacy of the straight line and right
gle which had betrayed itself at earlier
ods. This new tendency of the correct
cial art of the Court and capital to relax
formality in the caprices of Bérain and
ateau was reinforced by the barocco in-
ence from Italy.
f the rococo fashion has been dealt with
erely in our day, it did not escape criti-
m in its own. Reverend seniors of the
ademic School felt it incumbent on them
appear shocked at forms for which
ruvius gave no sanction, and to condemn
m by precept, if not by example. But
met with more whole-hearted opposition
m men who were caught in a current in
theory of design which was beginning to
in an entirely different direction.
Exactly where and when the reaction origi-
ed it may not be possible to determine,
it gained force from the general spirit
learned inquiry which pervaded the
VIIIth century, and brought about re-
rches into the architecture of Rome and
ece, both in Europe and Asia. The first
tems of chance in French architecture
rayed a Roman rather than a Greek in-
ence. The new phase of style, which began
arise between 1730 and 1750, was prac-
ed concurrently with the old between 1750
1 1770, and reigned supreme during the
nty years which preceded the Revolution,
s received the name of Louis XVI., who,
wever, did not come to the throne till
'4. In addition to its return to purer
ssical types and to a general abandonment
flowing curves in plan and decoration in
our of severe geometrical forms, it is
aracterised by greater simplicity that is,
avoids not only twirls and flourishes, but
necessary breaks and elaborations, and
ects quieter lines generally.
The movement did not become general till
conversion of the royal architect, Jacques
ge Gabriel, which took place about 1750.
briel was destined to give it its most monu-
ntal and suave expression, without either
effeminacy which sometimes characterised
erior decoration, or the frigidity from
ich the Pantheon, perhaps the greatest
ievement of the age, is not altogether free.
w men have ever had greater opportunities
n Gabriel, or been so well fitted to use
m. He new all the resources of tradi-
nal French design, and used them with
summate success, obtaining the same
ad, massive effects as the XVIIth century
d achieved, but without their bombast and
asional brutality. In works of the school
Gabriel architecture seemed to have
ched a stage of breadth and scholarship
al to the expression of all possible needs,
t nothing human can be final, and, in
tain works contemporary with his, symp-
ns are to be found of the general unrest
which European society was plunged in
second half of the XVIIIth century
ns of a dissatisfaction with established
titutions and traditions. For the time
ng this unrest manifested itself in an
ensified archæological tendency. It also
ame the fashion to copy ancient buildings
h a literalness hitherto unknown."

. E. Warren,

proposing a vote of thanks to the author,
d he was not quite in accord with the
ening words of the paper, that "no country
side of Italy made the teaching of the
naissance in architecture so thoroughly
own as France." It seemed to him that
nce did not accept the teaching
the Renaissance so unreservedly as
e other countries. France assimilated
spirit and nationalised it, but he did
think she accepted the literal teaching
the Renaissance even so much as we did in England. In England it came a great deal later, but England never assimilated the French influence as did other countries. Even in Holland there were thoroughly French-looking buildings quite early in the XVIIth century, and in Spain and Italy they found almost absolutely French versions of the Italian Renaissance. French architects did not seem to be so happy as the architects of northern countries in being able to build in brick without the intervention of stone. There were some brick buildings in Toulouse, but to his mind they were absolutely dismal in effect.

Mr. H. H. Statham,

in seconding the motion, said there was one particular quality in which the French Renaissance seemed to differ from the Italian. The Italians never really took to the Gothic, and as soon as they got hold of the Classic idea again they began to reproduce. On the other hand, France had behind it a great period of the most romantic style of which they were practically the inventors, and it was owing to that that the early French Renaissance took such a peculiarly picturesque form, quite apart from the comparatively cold way in which it was developed in Italy. Whatever might be said about the corrupt style of the early French Renaissance, he thought it had a very great fascination, and he thought it was one of the styles which had done more than anything else to add to the happiness of mankind.

The Chairman

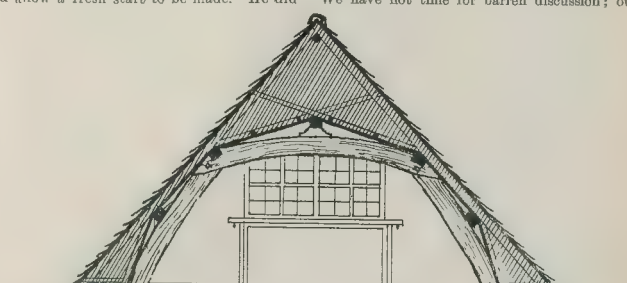
said the Italian Renaissance they could dissect and classify, but France had never been in that position, and had always maintained throughout some thread of tradition. The French Renaissance was split up into three periods: There was the first period of the amateurs, when people came back from Italy filled with ideas, but really knowing nothing about it. They insisted on the builders carrying out those ideas, and they did their best. Secondly, they came to the period of the architects proper, and they had a very good time as long as the Court lasted. Then came a period of unrest, and the XVIIth century went out in a state of chaos. In the last twenty years of the century the architects did little in France. Then came the reorganisation of the arts under Henry IV., who put the whole of France on its legs again. This was the most important period of the French architect, because during that time the art finally became that vernacular art of France—it became the art of the people. On the old general question Mr. Ward's paper seemed to lend colour to the statement sometimes made that art moves in a circle, and that it wanted a catastrophe like the French Revolution to clear the air and allow a fresh start to be made. He did not believe this. He believed that they really were moving forward, and that students would do well to study these great masters instead of taking up various fashions for study.

The motion having been heartily agreed to,

Mr. Ward

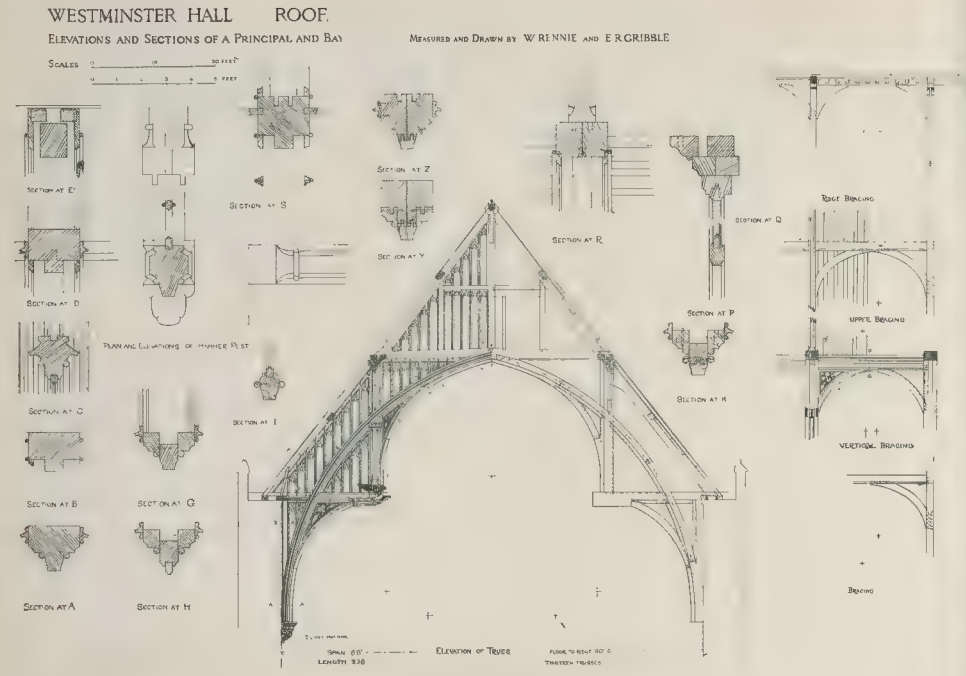
briefly replied, and said he cordially accepted Mr. Warren's correction. He did think, however, that the French influence did have considerable effect in England, and he was looking at some ornaments and monuments in Worcester Cathedral the other day which might well have come from a French book published about 1630. The date of the work he referred to was, however, about 1660 to 1670. In other places the French influence could be seen, but it came about twenty or thirty years later.

THE CARPENTERS' HALL LECTURES:



ROOFS AND ROOFING.

The eighth of the course of Carpenters' Hall lectures on the "Arts Connected with Building" was delivered on Wednesday last week by Mr. W. Curtis Green, F.R.I.B.A., whose subject was "Roofs and Roofing," Mr. P. A. Crisp, F.S.A., presiding.



The lecturer showed a number of interesting lantern slides, and in the course of his remarks he said:—

"Our task as craftsmen is, in the first instance, to see that we never produce less than fine prose, and never to lose sight of the goal, which is to create poetry of things in themselves commonplace. The training is one of mind as well as of eye and hand, for the mind to resolve the apparently complex and obscure requirements of the problem into its component parts before the eye or the hand come into play. This is the essence of style and of all progress in art. We must take to heart the saying of Emerson—"that the line of beauty is the line of perfect economy." Remember that all fine achievement comes from inspiration grafted on knowledge—the knowledge of long apprenticeship and of hard work.

Of the two ways of studying the past our concern is with the spirit in which the work was done rather than with the form it took. Archæological knowledge does not make a craftsman; it may by confusing the issue be his undoing. Until the XVth century men did not study the building arts of past times: they handed on the ways and customary methods of their own day, each generation and each race making its contribution to the advance, to the sum of achievement. I cannot satisfy some of my friends or offend others by finding faults with the Renaissance, with the various revivals, or with our own civilisation. We have not time for barren discussion; our

needs are too pressing, our time is too short; we have rather to prove ourselves men than that others long since dead were knaves or fools. We can afford to leave the question of whether we are children of the Renaissance, of mediævalism, or of classic civilisation. We cannot recreate the time and the conditions that produced their architecture and their crafts; we cannot recreate our own; our own is the product of theirs. The mistake that many of us make, and which the lesser men of the Renaissance made, is that in studying old work we have been occupied with the form rather than with the spirit. This error is fundamental, and has led to all sorts of theories—theories neglecting, on the one hand, the bases of the crafts—that is, utility, and on the other the "magical and mystical element," the product of the mind, the eye, and the hand in unison. It has led to all sorts of sham revivals of styles and forms without regard to new utilities and to continual intellectual and spiritual growth. There is no great discovery to be made in our calling, unless it is the discovery that we are capable of producing fine work. There is no necessity for originality in its ordinarily accepted sense. That distinguished quality will inevitably arise as we master our craft; yet our instinct will be to express our thought in forms which the eye both by custom and association delight in. This is my point of view with regard to the development of the subject we are considering to-night. Future development is along the old lines; one achieves a happy combination or develops a neglected principle; another catches it up, improves upon it, and hands it back.

Batts Corner Church, Frensham.

Mr. W. Curtis Green, F.R.I.B.A., Architect.

The history of architecture is very largely the history of roofing; the roof and the chimney are synonymous with home; indeed, if these two features were nowadays rightly arranged the whole aspect of the countryside would be changed. One of the fairest sights of an ancient town or village is that of looking down on it from above. This cannot be said of the mass of buildings now springing up round our towns and villages; the majority of these buildings are a blight on the countryside. All the great buildings of the world have, or had, wonderful roofs; the covering in of a great space was part of the problem their builders solved. The pyramid over the tomb of a Pharaoh was the Egyptian idea of monumental architecture—a mighty covering to their illustrious dead; in the case of the great Pyramid at Gizeh, the greatest and most accurate structure ever built, a roof covering 13 acres of land, Professor Lethaby writes:—"When it was new and sharp it must have gleamed cold and white like the peak of an alp rising above the burning golden sand." The Mausoleum of Theodoric at Ravenna has a domed roof hollowed out of a single stone 36 ft. in diameter, while the great

nes of the Pantheon, Santa Sophia, and St. er's, the vaults of Chartres, and the roof of stminster Hall are wonders for all time. ient architecture seems to have had wooden struction as its prototype. The Greeks used ber in their roofs—so far as I can discover, fs of a single span. The single span roof, t is to say, formed by two rafters pitching inst each other, is open to the objection of outward thrust against the walls on which y rest. The Greeks used purlins in their ples which arrested this tendency. The ek contribution to woodwork is not a small . All that is clear-cut and articulate the ek loved; all that is rough and ungainly avoided. While influenced by, if not under, weight of Egyptian precedent, the Greek out to discover a new realm of art, a royal gress from the mysterious and the obscure he comprehensible and the definable. This gress lifted the arts on to a new plane. tendency of the West has been to ance along these lines. This self-imposed llectual limitation to the finite and the nite is the contribution of the Greek to modern student. Matthew Arnold has l that, "Though in many respects the ients are far above us, there is something ch we demand that they can never give." same may be said of other periods as we ie to them; it is the key to study and gress.

Roman construction is in many ways near our own. Viollet-le-duc gives us an idea Roman construction in his illustration of the over the Temple of Fano. This adheres much as possible to the methods of carpentry cated in the antique paintings of Pompeii the bas-reliefs of the column of Trajan. says:—"The timber framing of the Middle s will also afford us great help in our eavours to become acquainted with the art of pentry as it existed among the Romans. all the processes of building construction, ber framing is certainly that in which litions were most faithfully preserved; even in the most barbarious times works in pentry never ceased to be executed in the st, and as early as the time of Cæsar, the ls passed for being very clever in the art of king and framing wood." The roof is shown ed with boarding according to Roman tom; it is not a hipped roof, which would e complicated the construction, but minated with gables of open frame and ice-work.

randon suggests that the absence of examples pen timber roofs during the early period Gothic architecture may be accounted for the monopoly in building enjoyed by the masons. He suggests that this body nen, who excelled in the working of stone, ised English oak and discarded it as an rior material. What is more likely is that were intent on working out, step by step, exquisitely beautiful groined vaults, the roof curtain as it were, to the roof-covering ve. First one and then another considera- swayed the Gothic builders, but one factor always with them, and that was the roof. England we were less ambitious than in nce; with a few notable exceptions, we were tent with far narrower spans to our roofs. consequence the construction is comparay simple, far simpler, for instance, than is case to-day. Owing to rebuilding, to ruction by fire, or to imperfect protection h the weather, there is apparently no open ber roof of the XIIIth century left to us. re is little doubt that roofs of this od were richly coloured with painted erns. As a rule, where the windows a church retain any remains of the inal stained glass, other parts of the church, h as the roof, have been enriched with ur.

is convenient roughly to classify open ber roofs as follows:—Roofs with tie-beams; sed rafter roofs -*i.e.*, single-framed roofs; s framed with hammer beams; collar- ed roofs. The sequence is chronological in origin, for it is impossible to divide ory into precise compartments, saying this done in that century or decade, that in ther. There is over-lapping, and the ciples having their beginnings in remote ory have been rediscovered and reapplied. cover, some districts developed one type, rs another. Kent, Sussex, and Surrey eloped a combination of the trussed rafter, eam, and single purlin. The West Country ved and perfected a trussed rafter of its own—a beautiful waggon-shaped roof. The Eastern counties are famous for hammer-beam roofs . . . The first man to carry his principles into practice in this question of roofs was, so far as I am aware, Mr. Weir Schultz, the architect of Khartoum Cathedral. He was asked to design a Church hall at Cardiff. The problem was to roof over a considerable area at a minimum of cost and yet to use materials the best of their kind. One of the first considerations in such a case is that of acoustics. The best form of hall for singing or speaking in is one with an open timber roof—such a form, for instance, as that of the Mediæval Hall. It was out of the question to use pit-sawn beams for posts and ties and branches for braces and struts. Fir of the ordinary stock sizes had to be used. It is a clever piece of construction, and I am personally indebted to Mr. Schultz both for leading the way and for lending me his drawings. These he has generously published in the *Builder*.* When my time came to solve a very similar problem in designing an adult school hall at Croydon, with Mr. Schultz's work before me I was able to carry the idea a step further. This hall seats close upon 1,000 people, and costs less than a third of what the ordinary unfurnished church costs. These are the working drawings. There are no rafters in this roof and no flat over the clearstory windows, the tiles sweeping round."

The lecturer showed some examples of various types of roofing, and described the principles of construction. He also showed some interesting examples of the work of Messrs. R. W. Schultz, F. W. Troup,—Gimson, —Box, and others, including some of his own designs.

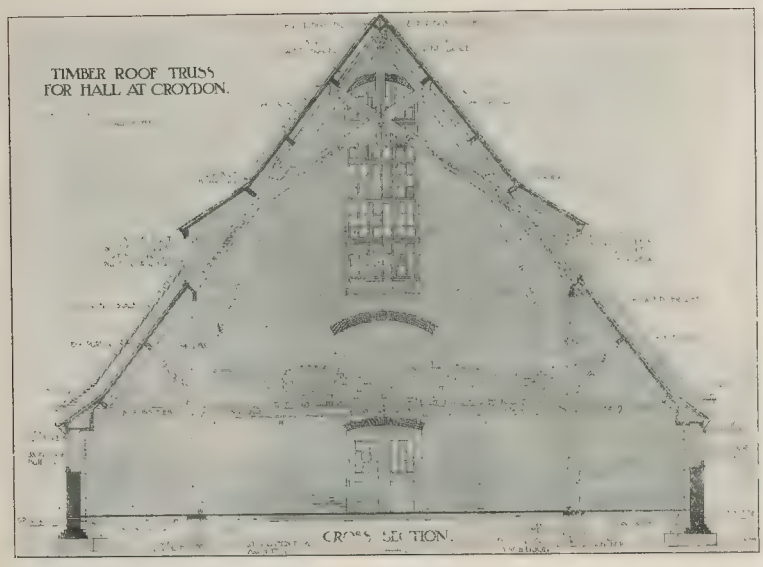
ARCHITECTURAL SOCIETIES.

Leeds and Yorkshire Architectural Society.

A general meeting of this Society was held on March 7 at the Leeds Institute, the President, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., in the chair, when a lecture on "The Scottish Renaissance Architecture" was given by Mr. Lawrence Weaver. A series of slides showing plans of houses and castles illustrated the fact that the towers formed their keynote unlike the English plan which developed from the Hall. It was pointed out that the Scottish Renaissance was entirely based on French influence owing to the political connexions between the two countries, whereas in England the influence of Italy and the Netherland was general. The Scotch Renaissance was much later than the English, and the tenacity of the old Baronial style is remarkable. Many fine slides were shown illustrating picturesque exteriors and gardens. Illustrations of interiors included many fine plaster ceilings and painted ceilings, fireplaces, staircases and screens. A vote of thanks was passed on the motion of Mr. G. F. Bowman and seconded by Mr. J. Smith Findlay.



York and Yorkshire Architectural Society.

The following is a *résumé* of a paper on "Sketching" read before this Society on March 13 by Mr. Wm. Whitehead, A.R.I.B.A., Mr. A. B. Burleigh, Lic.R.I.B.A., President, being in the chair:—

"In dealing with the subject of 'Sketching' I speak from my own experience and the educational value of sketching in the training

Church of the Good Shepherd, Frensham.
Mr. W Curtis Green, F.R.I.B.A., Architect.

Hall at Croydon. *(See previous page.)*
Mr. W. Curtis Green, F.R.I.B.A., Architect.

of fellow students of architecture. To treat the subject methodically I will divide it into the following sections:—The uses of sketching, the mediums and styles, composition, and what to sketch. There are times in everybody's life when they desire to put some of these impressions and ideas into more material form. What is the use of an architect who cannot put on paper his ideas? Something more than mechanical draughtsmanhip is necessary to delineate the very numerous and varied detail of modern times for the guidance of craftsman and workman. To attain this degree of proficiency in the various mediums nothing is more helpful than sketching. Other advantages to be claimed for sketching are familiarity with proportion, detail, and construction and perspective. Like all other accomplishments, there are the early stages of drudgery to be passed before one appreciates the pleasure to be derived. Of mediums the pencil, pen, and water colours are the most suited to architectural sketching. The pencil especially should be mastered and a directness and facility of expression attained. Water-colour sketching is probably the most fascinating of the three. The study of colour alone teaches one so much. The harmony of nature is not appreciated until one's notice is directed in the practice of conveying their impressions to paper. Composition in sketching architectural subjects is as necessary as in landscape and other subjects. Concentration, grouping, and contrast require consideration, but detail should not be sacrificed for effect. Lastly, what to sketch. Everything that is likely to be useful or is interesting. A note-book should always be in one's pocket ready to jot down notes, etc., of any feature or detail which one may see. Whether touring or holiday-making in any form, a sketching outfit should accompany one. Time spent sketching is never wasted, and there is always something to show for it. Many things which come to one's notice would otherwise probably be overlooked."

A large collection of sketches formed an interesting exhibition and illustrated many points in the lecture.

A hearty vote of thanks was given the lecturer, on the proposition of Mr. Geo. Benson, A.R.I.B.A., seconded by Mr. S. Needham, Lic.R.I.B.A.

Nottingham Architectural Society.

The fifth and last meeting of the session in connexion with the Designing Club was held at the Society's rooms on Tuesday, March 12. The President, Mr. Robert Evans, F.R.I.B.A., occupied the chair. Although the subject set by Mr. E. H. Child, A.R.I.B.A., "A Seaside Bungalow," was an attractive one, only four designs were submitted. After the criticism, a general discussion took place, and at the close Mr. Child gave his award as follows:—"Dorian" first, "Tide Time" second, and "Carbon" third.

The President, in proposing a vote of thanks to Mr. Child, remarked that it was not very encouraging to those gentlemen who gave up their time to set designs and examine them when there was such a poor response and poor attendance. At the same time, he congratulated the four competitors on their excellent efforts to fulfil the conditions set, which, in this subject, were by no means easy. As it was their last meeting for the session he also included their best thanks to Mr. Swann, the Hon. Secretary of the Designing Club, for his untiring efforts to make the competitions a success.

During the evening it was announced that an attractive programme was being arranged for the Social on March 26, and that, in addition to the students' work being exhibited, Mr. Arthur Marshall had promised to lend a selection of his own pencil sketches.

Sheffield Society of Architects and Surveyors.

Mr. F. E. P. Edwards, F.R.I.B.A., City Architect, went to Rome last autumn for the International Congress of Architects, and on the 14th inst., at the University, he gave members of the Sheffield Society of Architects and Surveyors a formal report on the Congress, and then went on to give an illustrated lecture on the Italian cities he visited, including fine views of architecture at works in Genoa, Pisa, Florence, Venice, and Milan, as well as of Rome. Speaking of a street improvement scheme in Rome, he said it had been under consideration 300 years—a statement which seems to excuse the slow way in which some Sheffield schemes are dealt with. The Vice-President, Mr. A. F. Watson, F.R.I.B.A., presided.

BOOKS RECEIVED.

ENGINEERING WORK IN PUBLIC BUILDINGS. By R. Owen Allsopp. (London: E. & F. N. Spon. 12s. 6d. net.)

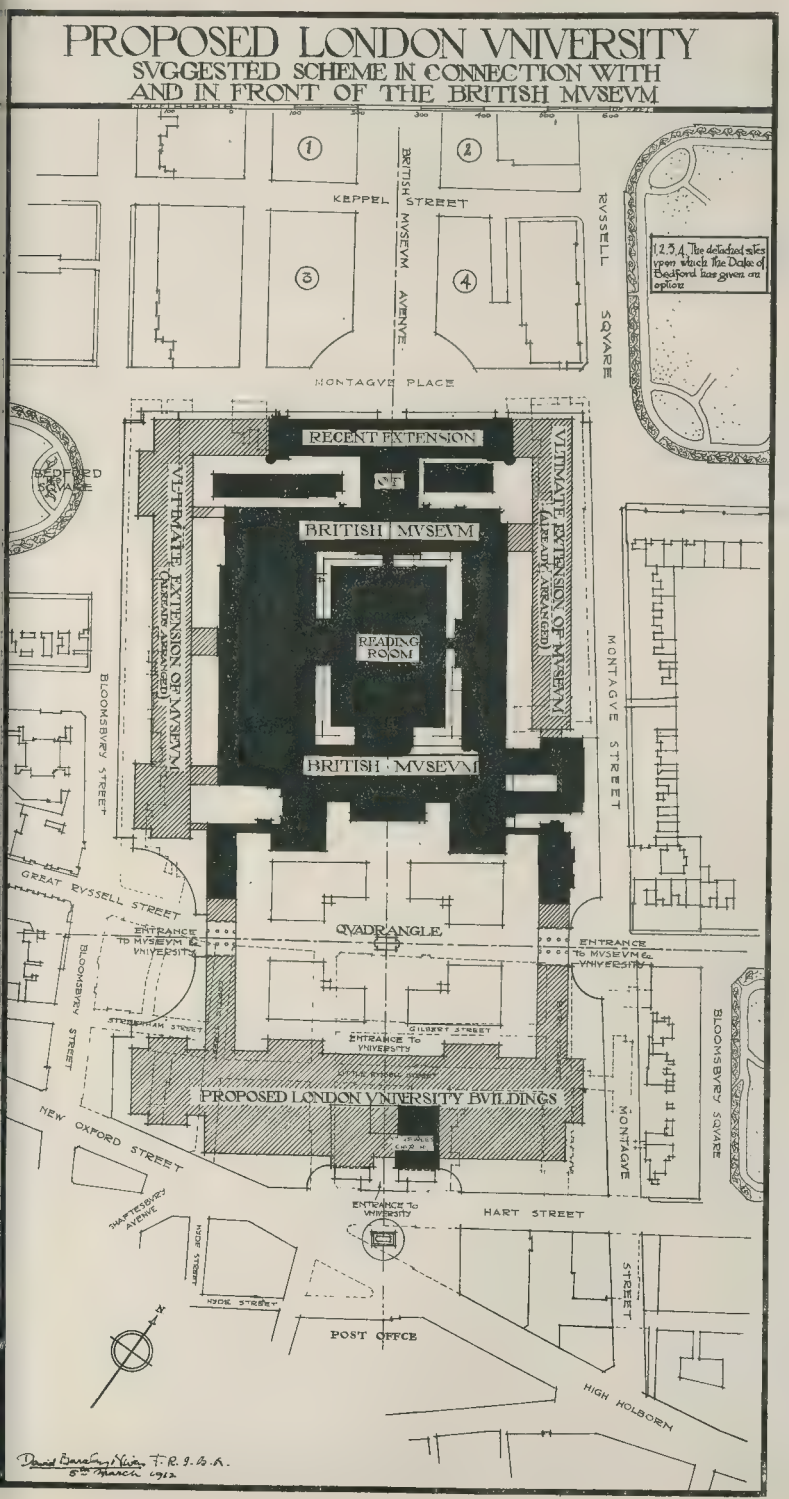
REINFORCED CONCRETE DESIGN. By Faber and Bowie. (London: Edward Arnold. 12s. 6d. net.)

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Captain G. S. Swinton, Chairman, presiding.

LOANS.—The Finance Committee recommended and it was agreed to make loans to borough councils as follows:—Deptford, 10,000*l.*, for street improvements; Hammersmith, 3,243*l.*, for underground conveniences; Kensington, 5,745*l.*, for street improvements; Poplar, 69,626*l.*, for electricity undertaking; and Stepney, 5,000*l.*, for electricity undertaking.

THE GAIETY RESTAURANT.—The Improvements Committee recommended that the offer of Marconi's Wireless Telegraphic Company, Ltd., of a rent of 6,500*l.* a year for a lease of the restaurant for ninety nine years be accepted.



KINGSWAY.—The same Committee also reported that an offer had been received from the London and Northern Estates Company, Ltd., of a rent of 2,050*l.* a year for a lease of ninety-nine years of a site between Lincoln's Inn-fields and Kingsway.

THEATRES, ETC.—The Theatres and Music Halls Committee reported that Messrs. T. Matcham & Co. had submitted drawings showing the proposed alterations to be made at the Amherst Hall, Kingsland High-street, N., and also for proposed alteration and enlargement of the Broadway-gardens Cinematograph Theatre, Walham Green.

The following drawings have been approved by the Committee:—Adelphi Theatre—new dressing-rooms and offices; Queen's Palace of Varieties, High-street, Poplar—construction of a cinematograph enclosure; Royal Academy of Music—arrangement of seating and steppings in the gallery in the concert hall; Royal Assembly Rooms, Woolwich—provision of permanent means of access to the cinematograph enclosure; Royal Horticultural Hall, Vincent-square, Westminster—provision of substructure to the platform; Wesleyan Methodist Hall, Westminster—arrangement of connexions for the switchboard for the battery circuit for the secondary system of lighting.

THE INSTITUTION OF CIVIL ENGINEERS' EXAMINATIONS.

At the Institution of Civil Engineers' Examinations of last February one of the pupils of Mr. G. P. Knowles, 39, Victoria-street, headed the list and obtained the Bayliss Prize.

PROPOSED LONDON UNIVERSITY.

WE have received the following communication from Mr. David Barclay Niven, F.R.I.B.A. :—

"A proposal has been published whereby buildings for a reconstituted London University are to be erected on four detached sites at the back of the British Museum.

As an alternative, I suggest their erection as one block in front of the Museum, in accordance with the accompanying plan.

In this the island area on which the British Museum stands is enlarged so as to afford ample space for these buildings adjacent to the Museum, with St. George's Church duplicated as a central feature, thus introducing a very delightful note in architectural treatment.

This proposal would bring the University into direct relation with the British Museum. The site is large enough for all needful expansion, and the buildings erected upon it would very properly be the visible expression of the University as a great public institution, and would appeal to the imagination of the people.

With the co-operation of the different authorities this scheme should be realisable, the leasehold tenure of the property affected contributing to its gradual development. The immediate necessity is for a liberal well-considered scheme for University Buildings. A start might very well be made on the area facing New Oxford-street, between Museum-street and Bloomsbury-street, where the leases first fall in.

The modern flats and hotels facing the Museum need not be demolished for many years, until the University buildings are almost complete, although the great quadrangle between the Museum and the University would not have its full significance until then.

The proposed quadrangle would show the buildings surrounding it to great advantage. It is as large as Bloomsbury-square, and should be one of the finest architectural courts in Europe. Through traffic would not be permitted, and the two great entrances, controlled by attendants, would maintain a sense of collegiate repose.

A small open public square might be arranged central with the new buildings, at the juncture of New Oxford-

street, Hart-street, and High Holborn. The land abutting upon this is mostly Crown property, which it should be possible to acquire on favourable terms. This open space would be convenient and would indicate the importance of this educational centre.

The scheme would be a great permanent London improvement, and not only the London authorities, but the nation, might co-operate in its realisation. It would enhance the value and increase the security of the priceless national collections in the British Museum upon which millions of public money have already been expended.

The Duke of Bedford, as freeholder and benefactor of the improvements to the north of the Museum, might also be ready to assist in this great improvement."

GENERAL NEWS.

Professional Announcement.

The address of Mr. Alfred Saxon Snell is now 9, Bentinck-street, Manchester-square, W.

The Architectural Association Athletic Club Smoking Concert.

The concert of the Architectural Association Athletic Club, which was a great success last year, will be held at the Pillar Hall, Victoria Station Restaurant, on Tuesday next, March 26, commencing at eight o'clock. Particulars and tickets may be obtained from Mr. C. G. Boutcher, 40, Great James-street, Bedford-row, W.C., and at the Architectural Association office.

Public Offices (Sites) Bill.

The Public Offices (Sites) Bill, presented by Mr. Wedgwood Benn, seeks to make provision for the acquisition of a site in Westminster for new buildings for the Board of Trade, to acquire land and buildings in St. Andrew, Holborn, for the further extension of the Patent Office, and to acquire land and buildings for use in connexion with the Record Office.

Raw Materials and the Coal Strike.

The Great Northern, Midland, the Great Central, and Great Western Companies will, it is stated, refuse to accept the following materials for carriage:—Sand, gravel, chalk, bricks, roadstone, slag, lime, cement, limestone, stone, round timber, iron ore, pig iron, coke, slates, manure.

The British Museum Site.

A friend of London University has offered, it is stated, a contribution of 100,000*l.* towards the acquisition of the vacant site on the Duke of Bedford's estate north of the British Museum. The donor states that he considers the site the most central and suitable one for the contemplated erection of new headquarters, and holds that the University of London ought to be the chief educational institution of the Empire.

Christchurch Priory.

Christchurch Priory is about to be restored, the Chancellor of the Diocese having granted the petition of the vestry for a faculty authorising the pulling down of the galleries in the transepts, the reflooring and rescating of the church, and the placing of a Holy Table in front of the screen. The work is to be proceeded with as quickly as funds will allow, and a series of plans have been prepared by Mr. T. G. Jackson, R.A., providing for a new raised and screned altar and the repairing of the altar-place with black and white marble. In addition, the flooring of the nave and transepts will be replaced with wooden blocks and the present pews give place to oak seats.

Richmond-hill View.

At a recent meeting of the Surrey County Council at Kingston the question of the making of a cutting from the Surrey bank of the Thames to the Ham lands belonging to the Earl of Dysart, where gravel excavations are being carried on, which, it is stated, seriously mar the famous view from Richmond-hill, again came up for discussion. The General Purposes Committee recommended that the County Council agree to the proposal of Lord Dysart to construct a cutting from the river bank through the river lands to a small dock proposed to be formed upon the site of the gravel excavations upon an agreement being entered into by Lord Dysart to contain provisions for the removal of the existing wharf and the covering in of the machinery. Councillor Thompson, of Richmond, moved as an amendment that the recommendation be referred back in order to obtain counsel's opinion as to the legality of the existing wharf on the riverside, which he held had no right to be there. Councillor Humphreys, of Richmond, seconded. Councillor West, Vice-Chairman of the Committee, said the Earl of Dysart had the right, by Act of Parliament, to excavate gravel on this land, and the only point was whether the Council would allow him to do this within certain conditions which would safeguard the amenities of the district. The lesser evil was the better one to adopt. On a show of hands the recommendation was adopted by thirty-five votes to twelve.

Ancient Monuments Bill.

In the House of Commons on Wednesday, in reply to Mr. N. Buxton, Mr. W. Benn (St. George's-in-the-East) said:—"The First Commissioner hopes to introduce the Ancient Monuments Bill next week, when full details will be available for the information of the Hon. Member."—In reply to Mr. King, Mr. W. Benn said he thought the proposal was to introduce the Bill in the House of Lords.

The London Museum.

A valuable collection of views of Old London—gathered by the late Mr. Warwick Wroth, of the British Museum is exhibited in the London Museum. The collection includes views of many of the old tea-gardens and similar places of resort such as the Dog and Duck, St. George's-fields, South Lambeth (whereof the sign, carved on stone, is preserved in the outer wall of Bethlehem Hospital); Sadler's Wells; the White Conduit House, Pentonville, by Rowlandson, 1787; the Pantheon in Spa-fields, by Humphrey, after a drawing by Edwards, 1772; and Bagnigge Wells, of which the gardens were traversed by the Fleet River, lying near what was Pearl-crescent, and between King's Cross-road and Messrs. William Cubitt & Co.'s stone and building yards in Gray's Inn-road. Mr Theodore Lumley has lent also his collection of rare prints relating to London, and Mr. Frank Corner his specimens of bronzes and pottery-ware. The five models of Old London by Mr. John Thorp which were exhibited at the Franco-British Exhibition, and afterwards at the Festival of Empire, have also been acquired.

International Smoke Abatement Exhibition.

An important exhibition will be opened on Saturday, March 23, at the Agricultural Hall, under the auspices of the Coal Smoke Abatement Society. The exhibition will comprise all the latest appliances for the use of smokeless fuels both in the home and in the factory, and should prove of equal interest to the housewife and to the business man. There will be a large display of gas appliances for cooking, for hot-water supply, for the heating of houses, shops, factories, churches, and other public buildings, and for furnace work. Every afternoon and evening demonstrations of cooking by gas will be given with practical hints in the economising of gas, and in the most effective utilisation of cookers, grillers, hot-plates, etc. Tickets of admission will be supplied by the Gas Light and Coke Company to any of their consumers who will apply at any of their offices. The fogs of London have been largely diminished in intensity of recent years as a consequence of the rapidly extending use of gas for fuel; but much remains to be accomplished before the air of London can rival that of Paris or New York, and it is hoped that this exhibition will do a great deal to stimulate the movement in favour of Smoke Abatement.

COMPETITION NEWS.

Liberal Club, Shanklin.

In the competition for the Liberal Club, Shanklin, the first premiated design is the one submitted by Mr. Gordon L. Thorne, 10, Atherley-road, Southampton. The second and third premiated designs respectively are by Messrs. G. W. Kingswell and C. W. Jolliffe, Shanklin, I.W., and Mr. Edgar J. Harvey, Grove-road, Ventnor, I.W.

Murton Housing Scheme, Durham.

The successful architect in the competition for workmen's dwellings at Murton, promoted by the Easington Rural District Council is Mr. J. J. Dobson.

Oakwood-avenue Council Schools, Warrington.

The following notice has been sent to all its members by the Manchester Society of Architects:—"The promoters refuse to modify the conditions they have sent out, and say that it is not their intention to employ a professional assessor.

I am instructed by the Council to inform you that these conditions are unsatisfactory to the Council; therefore members of this Society must not submit, either directly or indirectly, any designs in the above-mentioned competition."

Some Competitions and the Liverpool Architectural Society.

The Council of this Society requests all members to refrain from competing in the following architectural competitions, the conditions for which are unsatisfactory: Warrington Schools, Llandudno Police Buildings, and Ormskirk Golf Club Buildings.

CORRESPONDENCE.

A History of Architectural Development.

SIR,—In the notice of the third volume of my "History of Architectural Development," which recently appeared in your paper, it is stated that the work of the time of Louis Quinze is ignored. May I be allowed to point out that such is not the case? Pages 217 to 225 deal almost exclusively with this work, figures 183-4-5 (two photographs and a plan) are illustrations of it, and it is also referred to elsewhere in the volume. I have considerable admiration for the good points of the buildings of the reign of Louis XV., whilst not blind to their defects, and have expressed my appreciation in no uncertain manner in the pages mentioned. F. M. SIMPSON.

Combined Heating and Power Plant.

SIR,—Your note in the current issue summarising Mr. R. J. Durley's paper describing the plant at the Montreal University would lead one to imagine that we cannot show similar examples of economical engineering in this country.

Such is far from being the case, and, though bemoaning our general backwardness in such matters, one could name various cases where our buildings have been dealt with in like manner.

The first I call to mind is in connexion with our South Kensington buildings.

Electricity is generated for the Imperial Institute, Royal College of Science, School of Mines, and the new Post Office, all of which are warmed by exhaust steam from the engines. The steam is carried through a 16-in. main under the roadway.

S. WHITMORE ROBINSON.

Trade Unionism and Restraint of Trade.

SIR,—With reference to my letter in the *Builder* of February 23, I am pleased to note your statement on page 247 of the issue dated the 1st inst., that the trade union does not interfere with the number of bricks which any one of its members might lay in a day. The Secretary of the Institute of Builders confirms your statement in his letter appearing in your issue of the 15th inst.

I stated it was conceivable that on occasion a number of irresponsible bricklayers may have put their heads together and agreed to limit the number of bricks they would lay quite apart from the existence of a trade union, in the same way that on occasion builders have put their heads together and formed a "ring" for the purpose of keeping up prices without reference in any way to their Federation or Institute. Both events operate in restraint of trade, but in neither case is it fair to impeach the respective organisations.

I regret that the Secretary of the Institute of Builders allowed his feelings to impair the tone of his reply to my letter; but in having secured from such high authorities the admission that the trade union does not interfere with the quantity of work a bricklayer may or may not execute in a day's work I may safely commend the information contained in these letters to your readers. X.

EDITORIAL SUMMARY.

In the leading article some observations will found on the subject of Reinforced Concrete Architecture.

In "Notes" columns (p. 320) will be found nments on: "Ecclesiastical Metalwork"; he French Ministry of Fine Arts"; "Architture and Window Breaking"; "The East ssex Hospital Competition"; "The London nseum."

A meeting of the Royal Institute of British chitects was held on Monday, when Mr. W. H. rd delivered an able lecture and showed ny illustrations on "The Architecture of the nch Renaissance" (p. 322).

The eighth Carpenters' Hall Lecture of the ies on the Arts Connected with Building was ivered by Mr. W. Curtis Green on "Roofs d Roofing." We give an abstract and some strations (see p. 323).

"Architectural Societies" (p. 325) include ef reports of the following: "Leeds and rkshire Architectural Society"; "York and rkshire Architectural Society"; "Nottingham chitectural Society."

An illustrated suggestion in reference to the pposed London University is given on p. 327.

In Correspondence Column (p. 328) will be nd letters on: "Trade Unionism and straint of Trade"; "Combined Heating and wer Plant"; "A History of Architectural velopment."

Some notes on the magazines and reviews of month are given on this page.

The Monthly Illustrated Engineering Review 331) contains: "Reinforced Concrete in eat Britain"; "The Nile in English rness"; "The London Opera House"; esting of Materials Used in Reinforced Conte"; and Notes.

The Building Trade Section (p. 338) ludes: "Accident Policies"; "Safety ffolding"; "Fair Wage Clause, Cardiff"; Projected New Buildings in the Provinces"; Applications under the London Building ts," etc.

The second part of Mr. W. St. John Hope's ture on "The English House from the rmans to the Tudors" will be found on 341.

In Law Reports (p. 344) will be found a ef report of: "Richards *v.* Sanders & Son."

THURSDAY, MARCH 28.

Society of Antiquaries. 8.30 p.m.

MAGAZINES AND REVIEWS.

The *Studio* opens with an article on "Turner at Farnley Hall." This mansion on the River Wharfe belonged to Mr. W. R. Fawkes in 1797, when the painter first visited Yorkshire. A close friendship existed subsequently, and the fruits of this association between artist and patron were the series of architectural, topographical, and other water-colours to which reference is now made by Mr. A. J. Finberg. The "Paris Sketches" by Mr. Lester G. Hornby are vigorous semi-architectural studies, and among the "Recent Designs in Domestic Architecture" are examples by Mr. P. Morley Horder, Mr. George Walton, and Miss Ester Claesson, a lady architect of Swedish nationality.

The *Burlington* is an interesting number in which the illustration and reading matter are suitably balanced. The leading position is given to an article, with coloured plate, on the "Rajput Paintings," by Ananda K. Coomaraswamy, which is followed by a contribution by Mr. R. L. Hobson on "British Porcelain in the Trapnell Collection." Mr. A. Bredius has an article in which he gives reason for doubting that Rembrandt painted the portrait of Elizabeth Bas, and the article is accompanied by some fine photographic reproductions. Other contributions include: "A Museum of Oriental Art," by Mr. Lionel Cust; "The Portrait of Ginevra dei Benci by Leonardo da Vinci," by Mr. Herbert Cook, F.S.A.; "Exhibition of Pictures of the Early Venetian School at the Burlington Fine Arts Club," by Mr. Roger Fry, etc.

The illustrations in the *Connoisseur* are chiefly pictorial, with examples of furniture, pomanders, and English plate.

The *Architectural Record* opens with an example of "The Renaissance villa of Italy developed into a complete residential type for use in America," the example being the Harold F. McCormick House on the shore of Lake Michigan, designed by Charles A. Platt, architect, an interesting study in this direction, illustrated by plans and numerous beautiful photographs by Julian Buckly. More generally interesting, perhaps, is an appreciation of the work and personality of "This Most Excellent Master, Baldassare Peruzzi," by M. Stapley, in which full justice is done to his original outlook, his versatility, and his sensitive taste. Photographic views by A. G. Byne show the Palazzo Pollini at Siena, the Palazzo Farnesina at Rome, the Albergati at Bologna, the Casino of the Villa Farnese at Capracola, and the Palazzo Massimo at Rome. This latter has external and internal views, as well as a plan by Mr. Byne of the entrance floor, showing the extremely able manner in which this irregular site was handled. An article by Charles Henry Cheney on the American Academy in Rome is of topical interest. It gives the American point of view towards culture studies, differentiates them from the acquisition of technique, discusses the Ecole des Beaux-Arts in its relation to the subject, and in referring to the value of such a breathing spell in which the artist may "find" himself, points out that its full benefit cannot be derived by those not fully developed in technique. In this direction the British School at Rome may find some difficulties to start with. The article is illustrated by views of the Villa Aurelia, recently bequeathed to the Academy. Part IV. of "Early American Churches," giving views and description of The Ship Meeting House, Hingham, Mass.; St. Peters, New Kent County; and St. Luke's, Smithfield Old Meeting House, Lancaster, Mass., is followed by a "Portfolio of Current Architecture," and by an interesting article on the construction and equipment of the new building for the Curtis Publishing Company of Philadelphia, one of those large buildings full of technical equipment which American architects handle in so fearless a manner.

The *Nineteenth Century and After* is an interesting number, but the article of special interest to our readers is entitled: "Wanted: A Ministry of Fine Arts," by Gertrude Kingston, in which the writer points out that while other countries have their Minister of Fine Arts, England is still without one, though we do not quite follow her in her deduction therefrom that Art has no place in the history of the nation. But the article is in many respects a convincing one, and the views expressed will not be unfamiliar to readers of the *Builder*. In the course of the article the writer says:—

"I question whether the beautiful buildings that I see being destroyed daily in London—the latest to go are the houses in Lincoln's Inn-fields built by Inigo Jones himself—would not have been preserved and repaired in a suitable manner had there been a Ministry of Fine Arts At present, if they are conserved at all, it is only individual generosity that has to be thanked! It appears to be no part of the programme of the First Commissioner of Works and Public Buildings to take a walk between Piccadilly-circus and Oxford-street, let us say, and note the fine survivals of Old London that are marked down for destruction. The picturesque houses in Carlisle street, Soho, the historical houses in Lincoln's Inn-fields, the quaint passages between Soho-square and Golden-square, can nothing be done to make them sanitary and fit for habitation, while keeping the original character of the building? Supposing that there were a Ministry of Fine Arts, assuredly there would be a department for the preservation of such landmarks. . . . The argument will be, of course, that the Public Works has no available funds for the preservation of old monuments, yet this is exactly what could not happen if there were a Ministry of Fine Arts. It would have a knowledge of its requirements and a place in the Budget. That all over Great Britain there are magnificent historical manors, mansions, and castles still extant is due to the fact that these have been inhabited by private families. When it is a matter of castles that have belonged at some period of history to the Crown, it is more often the case that they are either in ruins or in a state of dilapidation; Richmond and Middleham and Ludlow may afford beautiful themes to the imaginative painter, but they are national monuments—of decay! The sum total of it all is that but for the individual there would hardly be an ancient edifice left. This we may say also of the pictures, sculpture, and other *objets de vertu*"

All this, of course, was written before the announcement of Mr. Asquith that a Bill will be introduced by the Government to deal with our national monuments, but even then the need for a Minister of Fine Arts will exist.

An article in *Scribner's* by Mr. E. L. Morse on "Samuel F. B. Morse, the Painter," is of considerable interest, as it records a fact, known probably to very few who are familiar with the name of Morse as the inventor of a system of telegraphy still in universal use, that this same Morse was a painter who is counted among the very best American painters of the first half of the XIXth century. He studied in England and was acquainted with Benjamin West, who took a great interest in his young fellow-countryman. With the article are given some illustrations of the work of the artist, which show him to have been a painter of no mean ability, especially as a portrait painter. Morse hoped to be chosen to paint at least one or two of the historical pictures for the panels in the rotunda of the Capitol at Washington, being supported by the National Academy of Design and others. The wish was expressed by John Quincy Adams, ex-President and Member of Congress, to throw the competition open to the artists of all countries, as he alleged that there were no American artists of sufficient ability to paint such great pictures. A caustic reply to Mr. Adams's assertions appeared anonymously in the New York *Evening Post*, and was attributed by him to the facile pen of Morse. The real author proved to be James Fenimore Cooper, but this became known too late, for Morse's name was rejected by the committee. "He never really recovered from this terrible blow to his artistic ambition," says the writer of the article, "he could never speak of it in later years unmoved; it practically ended his

career as an artist. Thus do the fates weave our destinies; what seem to be calamities are often blessings in disguise. Morse, the artist, dropped his discouraged brush and threw himself with all the ardour of his sanguine nature into the perfection of what was then looked upon as the idle dream of a madman; he struggled on through years of hardship and privation, and gave to the world the electric telegraph." In the same issue, an article on "The Armorer and His Art" appears under "The Field of Art," dealing with a loan collection of ancient European armour and arms recently exhibited at New York at the Metropolitan Museum of Art.

Harper's contains nothing of professional interest this month, but the issue is a good one and is fully illustrated.

ILLUSTRATIONS.

Union-Castle Shipping Offices, Southampton.

THE Union-Castle Shipping Company, Southampton, have recently made very large extensions and alterations to their Southampton offices, the work being carried out under the superintendence of the local architects, Messrs. Lemon & Blizard, FF.R.I.B.A. The exterior, which we publish, was built from the designs of the company's London architect, Mr. William Flockhart, F.R.I.B.A., in consultation with Mr. Blizard.

The Villa Madama, Rome.

THE villa was erected about 1516 by Giulio Romano from designs ascribed to Raphael. It was built for Cardinal Giuliano de Medici, afterwards Pope Clement VII., but was never completed.

Partly destroyed by fire in 1527, it subsequently came into the possession of Margaret, daughter of Charles V., from whom it derives its name. It afterwards belonged to the Farnese family, and then to the kings of Naples, who suffered it to fall into complete neglect.

The villa and its gardens at one time formed an important model for the arrangement of the gardens of Italy.

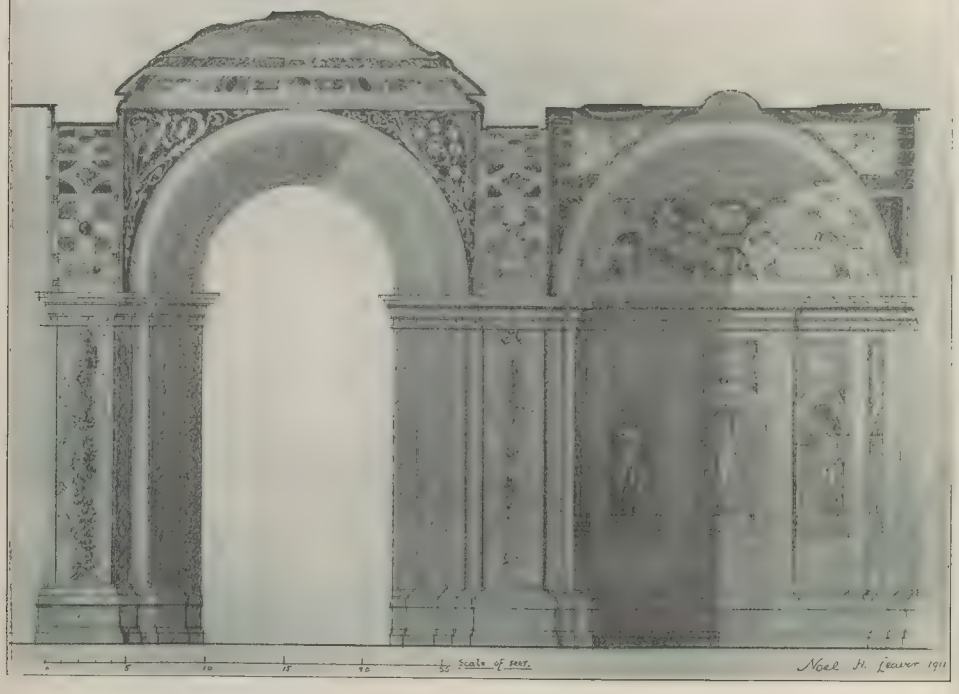
The fresco decorations in the loggia of the unfinished building were executed after 1520 by Giulio Romano and Giovanni da Udine, pupils of Raphael.

Chapel in the Palazzo Riccardi, Florence (Cappella Riccardi).

THE Palazzo Riccardi, now the official seat of the Prefect of Florence, was formerly the Palace of Medici. It was built by Michelozzo Michelozzi about 1430 for Cosimo il Vecchio. The family of the Medici continued to reside there until 1659, when it was sold by Ferdinand II. to the Riccardi family, from whom it took its present name.

The walls of the chapel are decorated with frescoes by Benozzo Gozzoli, executed between the years 1459 and 1463, for Piero "il Gottoso," son and heir of Cosimo il Vecchio.

The chancel, an elevation of which is shown on the plate, contains two groups of adoring angels, while the remaining portions of the walls are covered by the "Procession of the Magi," with its large train of Florentine citizens, servants, and cavaliers. Many of these are contemporary likenesses, and include several of the Medici, also a portrait of Benozzo Gozzoli, the artist.



FIFTY YEARS AGO.

From the *Builder* of March 22, 1862.

The Green Park a Monument to the Prince Consort.

IT may be remembered that this land has a gradual slope or inclination from Piccadilly down to St. James's Park. We would divide this slope into so many terraces, with flights of steps descending to each successive level. Here we have at starting and almost ready at hand one grand feature, for it is an admitted fact that nothing has a more stately, impressive, or palatial effect than this mode of laying out ground. It is these flights of steps leading to their terraced temples that impart so much beauty to Indian architecture, and are known there under the appellation of Ghauts. This effect has been well understood since the time of the hanging gardens of Babylon down to those of the Isola Bella. We would devote each of these terraces to the statues or busts—perhaps alternately one of each—to commemorate the peculiar talent of illustrious men. This galaxy of worthies should be confined to England; and there is no want of material for the purpose. By way of hint let us just enumerate the stock upon which we would draw to carry out our purpose: Sovereigns, male or female; legislators and statesmen; poets; military commanders; navigators and naval commanders; dramatic writers and performers; authors, naturalists, artists, sculptors, mathematicians, and astronomers; antiquarians; judges and lawyers; philosophers; scholars and critics; fathers and theologians; prelates and reformers; public benefactors, historians, orators, rhetoricians, and physicians. Now here is a list which might be added to or abstracted from.

At the terminus of the principal vista or avenue of these terraces might be placed the statue or monument of the great object of the whole design, namely, that which is more particularly intended as a commemoration of the late Prince Consort. In the first place it is not necessary that the whole should be completed at one and the same time. The whole of the ground should be laid out, of course, and the terraces completed, most certainly; and the statue commemorative of the departed Prince should also be erected, and pedestals should mark the place for future statues, or busts, as may be. It would doubtless be a pleasing duty each year to add one or more objects towards the completion of the whole; but much might be effected at the present time.

INFORCED CONCRETE IN GREAT BRITAIN.—III.

By W. NOBLE TWELVETREES.

(*Continued from page* 213.

Systems of Class (a)—*continued.*

ONSIDÈRE SYSTEM.—More than ten years ago M. Armand Considère, of Paris, made a series of investigations the properties of concrete reinforced teel in the form of spiral coils. and communicated his results in the autumn 902 to the Académie des Sciences. His sting investigations and their results have ly been discussed at length in Vol. LXXXV. *Builder*, to which our readers are referred tails. These and subsequent experiments , Considère attracted much attention on Continent and in the United States, and suggested various series of tests for the se of determining the efficiency of lateral rcement in compression members.

er having carried out numerous works in rced concrete in France, M. Considère in established an agency in London for ng his patents, under the style of the dère Construction Company, Ltd., of minster.

e British patent granted to M. Considère 02 was amended in accordance with the on of the Chief Examiner to the Patent in May, 1911, and in the amended ication the only claim is the following: - n constructions of stiffened concrete, rmation of parts under compression in a way that a core of concrete or the like is nded by metallic hooping either external bedded, formed of independent consecutive circular bands, or of helicoidal spirals or without longitudinally arranged wires ds."

e specification also states that the invention s generally to reinforced concrete structures, s more especially applicable to the con- ion of buildings, bridges, and arches of span.

e chief feature of the Considère system is ntroduction of lateral reinforcement as bed above into the areas of concrete under ression, to resist the lateral swelling of the te, longitudinal bars being added in uence of practical considerations. The rcement consists of ordinary round steel nd rods, and the spiral transverse rein- ent is coiled on the site of the works ans of a small hand windlass.

1 gives details of the most recent arrange- of the reinforcement in Considère system ns and continuous beams. The beam here ented is reinforced by tension and com- on bars, vertical web ties or stirrups. n bars in the upper part of the beam near upports anchored into the concrete in ession also near the supports, and spiral or the reinforcement of the concrete in st-named place.

ill be noticed that the main tension bars dependent of the armouring over the inter- te supports, which the patentees claim decided advantage both from theoretical ractical considerations, and that the web re spaced at progressively increasing ces apart from the supports towards the of the span as required by theory.

ng the advantages claimed for this are the following:—

That the resistance and safety of con- s and built-in beams are greatly increased by the addition of spiral coils in the compression areas outside the points of contra-flexure. The patentees also point out that the use of spiral coils in this manner obviates the need for gussets, which may be objectionable architecturally, at the junction of beams and columns.

(2) That the efficiency of spiral reinforcement in columns and struts is from two to three times greater than an equal amount of steel applied in the form of longitudinal bars.

(3) That columns and struts constructed as described are less affected by defects of workmanship in the concrete than similar members constructed in accordance with other systems, and, moreover, they always give adequate notice before final collapse takes place.

Fig. 2 illustrates a new type of column footing patented by M. Considère. The design of conical foundations in this form presents no great difficulty, although the several possible modes of failure have to be carefully considered in designing the profile of the cone and the proportion of reinforcement. The uniform upward reaction of the ground must be resolved at various points into a horizontal component, and also an oblique component acting in the direction of the generatrix of the cone. The first of these components represents a bursting force against which resistance is furnished by circumferential reinforcement, while the other component results in compressive stress, for which provision must be made by an adequate thickness of material. Another contingency is that the column may shear a hole through the roof of the cone. This possibility governs the depth and the amount of reinforcement at the crown. It is claimed that conical foundations of the type described result in great economy, particularly for heavy column loads on ground where only a low pressure per square foot can be safely permitted.

The business of the Considère Company is wholly confined to the design of structures in reinforced concrete, embodying only plain round bars of mild steel of the ordinary commercial sizes. Contractors are not supplied by the company with any material, and any firms of good standing and repute are free to tender for works in accordance with the Considère system on the quantities prepared by the company. All fees and patent royalties in connexion with the preparation of designs are included by the contractor in his tender, and the company are always ready to take full responsibility for all works designed by them.

Piketty System.—M. Paul Piketty, of Paris, having been engaged for about twelve years in the construction of reinforced concrete structures in France, has recently opened a branch in London under the style of Paul Piketty & Co., at 14, Bloomsbury-street, W.C.

The Piketty system of reinforcement for beams and slabs somewhat resembles that of M. Hennebique, and in certain respects is similar to that of M. Coignet.

The steel employed is in the form of round bars for resistance to tension and compression, and of thin rods bent into U-shaped loops for resistance to web stresses.

Fig. 1 contains three part longitudinal sections representing the arrangement of the reinforcement in beams with the ends built into a wall. The main tension reinforcement consists of two or more bars, of which one in each group is always bent up towards the ends, and, as shown in the bottom section, other bars may be similarly treated. The ends of the bars are either fish-tailed or fish-tailed and bent to J-form for security of anchorage. One or more bars are always inserted in the compression area of beams for the following reasons:—(1) For increasing compressive resistance; (2) for resistance to secondary tensile stress due to permanent deformation of the concrete; (3) to provide to fastening the upper end of the web loops or stirrups.

The latter are placed at varying angles, which increase progressively until at the middle of the beam the stirrups are vertical. The upper ends of each stirrup are bent over the compression bars at right angles, as represented in the drawings. Importance is attached to the horizontal projection of the ends of the stirrups into the slabs connected with beams,

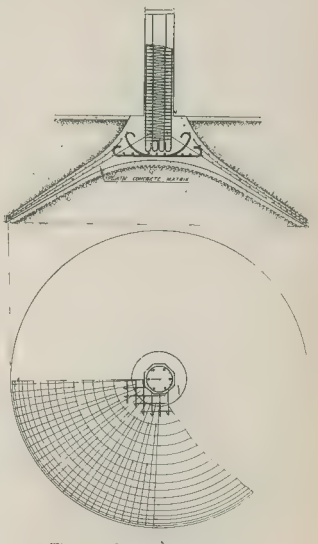

Fig. 2.—Considère System: New Type of Column Footing.

an arrangement offering efficient resistance to the shearing and tensile stresses along the longitudinal connexion.

Slabs are reinforced by two series of rods, those in one series being horizontal throughout, and those in the other series being bent up so as to pass over the compression reinforcement in all supporting beams.

Fig. 2 illustrates the arrangement of the reinforcement in continuous beams and slabs, also showing details at the connexion between a column and the component parts of a floor system. It will be noted in the drawing here given that the floor slab is reinforced in two directions at right angles to one another.

Fig. 3 includes two cross-sections of heavy beams with compression reinforcement rendered essential by the stresses to be resisted, the topmost bars incidentally serving for the attachment of the stirrups. Over the tension reinforcement will be noticed short bars intended for the uniform distribution of the stress, and fulfilling the same purpose as the analogous bars in the Coignet system. It should be noticed that the compression reinforcement is surrounded by encircling bars serving the two-fold purpose of linking the bars together and of increasing the compressive resistance of the concrete by restraining its expansion.

Columns in the Piketty system may be square, polygonal, or circular in cross-section. The reinforcement consists of longitudinal bars braced at intervals by transverse ties, each composed of a steel rod bent around each longitudinal bar, and the ends turned inwards so as to be embedded in the concrete core of the

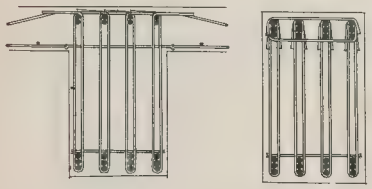

Fig. 3.—Sections of Heavy Beams.

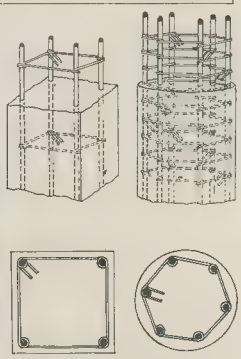

Fig. 4.—Column Reinforcement.

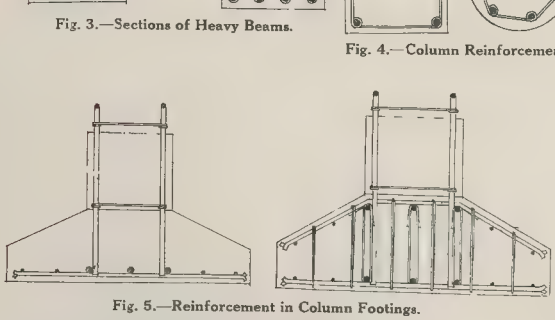

Fig. 5.—Reinforcement in Column Footings.

ILLUSTRATIONS OF PIKETTY SYSTEM.

column. Fig. 4 illustrates two arrangements of this simple method of column reinforcement.

Column bases in the system are reinforced either by a network of tension bars laid near the lower surface of the concrete, or of both tension and compression bars and vertical stirrups, as shown in Fig. 5.

The chief advantages claimed for the Piketty system may be thus briefly summarised:—

(1) That the sloping portions of the upward bent bars in beams furnish the greater part of the resistance needed against stresses due to negative bending moments near the supports of built-in and continuous beams, the remaining resistance being afforded by the upper straight bars around which the ends of the stirrups are turned.

(2) That the angular disposition of the stirrups, varied according to calculation in every case, is one offering the most effective resistance to tension on diagonal planes in the concrete.

(3) That the transverse ties in column reinforcement have the effect of bracing the longitudinal bars in their correct positions and of raising the ultimate strength by preventing the swelling of the concrete under compression.

Messrs. Paul Piketty are willing to give advice to architects, engineers, surveyors, and to their licensed contractors. Contractors for this system of construction are selected from old-established and experienced builders and contractors having reputation for excellence of workmanship, and the firm hold themselves personally responsible for all designs issued from their office.

THE NILE IN ENGLISH HARNESS.*

A COMMON device on the pedestals of the statues of ancient Egypt, more than 3,000 years old, depicts "The Binding of the Two Lands" of the papyrus and the lotus, of the Upper and Lower Nile. It is evidence to show that during the time of the Pharaohs it was recognised, as is done to-day, that whoever is responsible for the welfare of Egypt must control the Nile from its sources to the sea.

The ancient Egyptians appear to have supposed that the source of the Nile was in a cave of the granite islands above the first cataract at Assuan. But information is more exact now. The sources of the Nile are two-fold, viz., the mountains of Abyssinia and the great lakes at the Equator. The rain which falls in the Monsoon months in Abyssinia produces flood discharges in the Blue Nile, Atbara, and Saubat Rivers, and these uniting cause the flood in Egypt. When these floods subside the steady flow of the Nile in summer is maintained by the water that flows out of the Equatorial lakes into the White Nile.

In 1882 the battle of Tel-el-Kebir was fought, and the British occupation of Egypt began. In 1883 the care of the irrigation was entrusted to Sir Colin Scott-Moncrieff, who obtained four irrigation engineers from India to assist him. They found the "Corvée" or official system of unpaid labour established in this country, and one of the beneficial effects of their activity was the abolition of this form of organised slavery and the substitution of paid voluntary labour for it.

The most important part of their work was in Lower Egypt, the Delta, where Mehemet Ali had, during the XIXth century, introduced cotton cultivation, necessitating irrigation all the year round instead of a single inundation during flood time—the ancient system under which corn and cereals were grown. An attempt was made to obtain water by digging canals deep enough to draw in water from the Nile when at its low summer level; but the Corvée was not able to keep these canals clear to the requisite depth, so a river regulator was designed to raise the water level of the river sufficiently to cause a flow into the distributing canals.

The Delta Barrage.

This work is now known as the Delta Barrage. It was designed and built by a Frenchman, Mougel Bey. It consists of two fine regulators, one across the head of each branch of the river just below the point where it divides into the Damietta and Rosetta branches. Each regulator has sixty-one bays with sliding gates for regulating the river levels and discharges. It was designed to hold up 13 ft. head of water. But the foundation layer of concrete had been recklessly laid in running water and the mortar had been washed away, so that the bottom layer of the foundation platform was nothing but loose concrete metal with no binding material to make it water-tight. Consequently, after the superstructure was complete, and an attempt was made by closing the openings to hold the water up, a flow through the bottom layer was produced which displaced the sand on which the whole rested, and cracks and subsidences appeared in the superstructure of a most ominous description. The closure of the openings was therefore removed and the pressure taken off to save the work from destruction. It failed to perform the work it was designed for, and henceforth, till the British occupation, was of use only as a bridge for traffic.

In 1884 the barrage was taken in hand by the new Anglo-Indian engineers. After preliminary examination and experiments its restoration was decided on. A new floor of sound masonry was built over the old one, all springs and leaks and defects being scientifically and thoroughly treated. The new over-lying floor was then prolonged up-stream and down-stream so as to form aprons

* Abstract of a lecture by Sir Hanbury Brown, delivered at Carpenters' Hall, London-wall, on February 15.

. sound construction. The old defective ndation platform was thus covered over d enveloped with a sound exterior floor, ting it off from communication with the er. This work being completed, the rage held up 13 ft. head of water, as it s designed to do.

Cement-Grouting the Foundations.

But still there was left untouched the de- tive bottom layer of the old platform. If s in addition could be compacted together, structure would be still further secure. So e-holes were jumped from the roadway in centre of the masonry of the piers 57 ft. wnwards into the sand-bed of the river derlying the foundations. Five bores were de in the length of each pier. When a e was found to be clear, neat cement-grout, , cement and water only, was poured down bore, and the pouring continued till the e was full to roadway level. The pressure rted at the bottom of the bore by the uid column of cement-grout was 2¼ tons square foot, sufficient to force the grout o all unoccupied spaces in connexion with e bore at any point. Evidence of the travel d setting of the cement under the founda- ns was obtained when clearing bores not grouted. Altogether on the two barrages aggregate of 7⅔ miles of bore was made d over 6,000 barrels of cement poured down m.

Subsidiary Weirs of the Delta Barrage.

But, though, after this operation, the rrage was worthy of more confidence, the ect evidence of the defects in the original ndations obtained by the boring tools duced such an effect on the minds of those ponsible for the irrigation that it was cided to build subsidiary weirs down- eam of the two barrages to pond up the ter, and relieve the old work of some e duty imposed upon it. The weirs were ordingly designed to hold up 10 ft., and barrage was to hold up 10 ft. more, so at, while the head on the barrage was duced from 13 ft. to 10 ft., the total heading was increased from 13 ft. to 20 ft., giving increased control over the river at the ne time as greater security.

The method of construction of the weirs ords a remarkable instance of the employ- nt of cement-grout for subaqueous work. e main wall of the weir went down to 20 ft. ow lowest water level; the footing wall, ft. deep, was also below low water level, well as the greater part of the weir filling. account of anticipated trouble with ings, it was decided to build these weirs thout any unwatering of the foundation a. The river bed was first dredged out to foundation levels of the weir all over, d the main wall and footing wall were then in by forming a succession of blocks under ter by the employment of cement-grout. e blocks were formed by the help of a t made of two large barges with a travelling atry spanning the interval between them, low the gantry and between the barges a r-sided box was formed, the bottom of the x being the dredged bed of the river. The x was 30 ft. by 10 ft. by 20 ft. to 25 ft. ep. Four perforated pipes were fixed along axis, and the box was then filled to water el by throwing in rubble stone of all sizes. ment-grout was then poured into un- forated pipes introduced into the perforated es, and the pouring continued till the water the box had been displaced and the grout d risen to the level of the water outside box. The inner pipes were then with- wn and the box and contents left un- turbed till next morning. It was then nd that the cement had set sufficiently to d the block together, and the box frames re eased off, the sides dismantled, and the paratus moved forward, less one end, to m a three-sided box, with the block formed ving in place of the end removed. A ond block was then made joining on to the t, a third on to the second, and so on, till ntinuous wall had been made right across river. The clay and rubble filling. vided in the design, were then deposited ler water, and the remainder above water el built in the ordinary way.

Exhaustion of Natural Supply.

The old Delta Barrage having been con- dated by adding new floors and aprons, by cement-grouting its defective founda- s, and having been relieved and its ctiveness increased by the subsidiary weirs, such a command over the river had been obtained that every drop of the natural discharge of the river in summer was utilised in the irrigation of the cotton crop, and there was a demand for more.

It became therefore necessary to store some of the river's surplus of the flood and winter seasons to supplement the summer's supply. After careful study the project which involved the construction of the Assuan Dam was decided on as the best of the alternative schemes put forward.

The Assuan Dam is built on the crest of the First Cataract where the river flows over a bed of granite.

Dam Site.

During flood the river flows over the cataract as an unbroken sheet; but when the flood subsides the granite emerges above water level and the river divides itself into five separate channels. The construction of the dam along the length above water presented no engineering difficulty. It was at the five channels, running deep and with high velocity, that the engineer's skill and resource were brought into play. The method of enclosing and laying dry the area within which the permanent dam was to be built was the following.

Temporary Dams to Close Channels.

Temporary dams were made upstream and down-stream of the foundation site. The down-stream dam was first made of large stone to check the rush of water. The up-stream dam was then made, also of stone, still further checking the flow. The upstream slope of this dam was then staunched by small stone, sandbags, and sand till it was practically water-tight. The water between the temporary dams then fell to the level of the water down-stream of the lower dam. This dam was then staunched on its outer face till it, too, was water-tight. The water enclosed between the dams was then pumped out and the site of the work laid dry.

This may sound simple. But in several cases the making of these temporary dams was a formidable undertaking, stones up to 12 tons in weight being used. The Bab-el-Soghair—or little gate—had a depth of 28 ft. of rushing water. As the closing dam advanced its roaring torrent increased in violence and resisted all efforts to master it. The heaviest stone and stone encased in wire-netting was thrown in, and for a week no progress was made. The Nile demanded a sacrifice. So two heavy railway trucks were filled with stone in wire-netting, each truck with its stone weighing 25 tons. Wire ropes were passed under the trucks and over the stones, and the two trucks were bound together with wire ropes. A locomotive with steam up behind the trucks then put on full steam ahead, and shot the whole 50 tons bodily into the roaring water. This settled the business. The trucks stopped where they landed, and formed a footing for the stone which was then thrown in to complete the dam.

Excavating Foundation Bed.

The foundation area having been made accessible, the first operation was to clear away the unsound granite by pick or blasting, till a sound granite bed had been reached all over. The building of the dam of uncoursed granite rubble in cement-mortar was then taken in hand.

Details of Dam.

The dam is 1¼ miles long, it has now (after raising) a greatest height from foundation bed of 143 ft., and will ultimately support a maximum head of 90 ft. The ultimate capacity of the reservoir formed above the dam will be 2,300 million cubic metres (about 506,000,000,000 gallons, or half a million million gallons). It will have cost about 4,200,000*l*. During construction there was a population of 15,000 connected with the work. The maximum shade temperature was 120 deg.

Design of Dam.

The dam passes the whole river discharge through 180 sluices, and has no waste weir or overflow. This particular form of dam was adopted to avoid the tendency of the river to deposit its silt if its velocity of flow were to be checked during flood by material heading up at the dam.

Philæ.

The submersion of Philæ and its picturesque group of ruins is the one deplorable result of the creation of this fine reservoir, but, compared with the benefits resulting to Egypt from the construction of the Assuan Dam, the loss of beauty that the face of Philæ has suffered cannot be counted as unmitigated.

The lecture was illustrated throughout by interesting lantern slides.

THE LONDON OPERA HOUSE.—II.

Steel Construction.

THE whole of the steelwork in the new building was constructed by Messrs. Richard Moreland & Son, under the direction of the consulting engineer, Mr. A. T. Walmisley, M.Inst.C.E., of Westminster.

In order to convey an intelligible idea of the steelwork without unnecessary words we will state the nature of the construction on the different floor levels of the building:—

Stall Plan.—The only steelwork is represented by stanchions behind the stalls for the support of floor girders in the part of the building containing saloons and other accomdation for the public, and for the support of the circle and gallery girders.

Box Tier Plan.—Behind the stage one bay of flooring is carried by steel beams; in the auditorium the steel framing of the box tier is suspended from the floor above; and behind the auditorium steel is extensively used in floor framing.

Circle Plan.—Behind the stage steel framing occurs on the main and mezzanine floors; the circle framework and floor beams behind being also of steel.

Lower Gallery Plan.—In addition to floor girders and joists behind the stage, two 60 ft. span trusses carry the flies on either side of the stage, which is closed at this level by the proscenium girder, 49 ft. long; the gallery and upper boxes, as well as the floors behind the auditorium, are carried by steel framing.

Upper Gallery Plan.—The only steelwork is that of the gallery and a narrow strip of floor behind.

Roof Plan.—Behind the stage the roof frame is of the same design as for a floor; over the stage the roofing is supported by four large trusses carried by two trussed girders; the auditorium roof is carried by a series of six trussed girders extending from side to side of the building; and the flat roof over the part behind the auditorium has steel framing akin to that of a floor.

Although the whole of the steelwork was designed and executed in accordance with the most recent practice, much of it is necessarily of most familiar character. Therefore, in the subjoined notes we give particulars only of the more important details of construction.

The stanchions receiving the enormous loads transmitted by the circle and gallery girders are based on special steel grillages embedded in concrete, the largest of these being 7 ft. square in plan.

The steelwork for the thirteen boxes in the main tier at entrance level is suspended from the main girder of the circle above and the six boxes at the sides are hung from wing girders. The radial floor girders, consisting of 8-in. by 5-in. I-beams, are inclined at the required slope and connected by circular rows of 8-in. by 5-in. beams, and 4-in. by 3-in. joists, the system being completed by 7-in. by 4-in. joists in the outer ring as shown. Each main joist is provided with three slings for attachment to the floor above, the slings being concealed in the partitions between the boxes. The reason for suspending the circle was to avoid obstruction at stall level, where the only columns are two at the sides quite out of the way of the audience. By suspending the box tier as described the load on the grand circle steelwork was greatly increased, and, in consequence, the main girder of the circle tier is of unusual proportions, and is said to be far larger than any member of the kind hitherto employed in theatre construction.

Fig. 1 is a half plan of the grand circle framing. The circle is carried by sixteen raking cantilevers built up of angles, plates, and I-beams. As may be seen by the drawing, fourteen of these cantilevers are fixed into the walls at one end, extending across the main girder to the front of the circle, and two of them start at the main girder, the framework being completed by five raking beams between the main girder and another transverse girder, 22 in. deep by 9 in. wide, at the back of the auditorium. This girder is supported by six stanchions. Steel

The London Opera House, Kingsway.

Mr. Bertie Crewe, Architect.

joists are included as necessary for support of the concrete flooring.

In order to reduce the span of the cantilevers as much as possible, two raking girders of 42 ft. span, 33 in. deep by 24 in. wide, have been introduced, one end built into the side walls and the other end carried by the main girder. Each raking girder weighs more than 12 tons. These raking girders also support one end of each wing girder, 31 ft. span by 19½ in. deep by 18 in. wide, carrying the side-raking cantilevers.

Fig. 2 is a section through the steelwork of the circle showing the suspended flooring of the box tier below, and one of the raking cantilevers in the circle framework. In the same drawing may be seen the arrangement of the stepped tiers upon which the fauteuils are arranged.

The main girder forming the chief support of the grand circle, and of the box tier below, extends from side to side of the house in one span of 85 ft. without intermediate columns or stanchions. This important member is 89 ft. long by 62 in. deep by 31 in. wide, and weighs 62 tons. Fig. 1 contains a half plan, which is built up of steel plates and structural sections. It was constructed at the Silvertown Works of Messrs. Moreland & Son, and delivered in parts at the site, where it was riveted together in position, the ends being carried on stanchions built in the side walls. The load transferred to the stanchions from the girder is 500 tons, half at each end.

The last-mentioned member is carried by two stanchions built into the side walls of the structure.

Each stanchion is 22 ft. 1 in. high over all, and composed of two 15-in. by 5-in. 42-lb. I-beams, spaced 11 in. apart centre to centre, with two 18-in. by ½-in. steel plates, one on each side. The stanchions are hidden in the outer walls of the building and their bases are supported on grillages composed of four 18-in. by 7-in. 75-lb. I-beams embedded in concrete.

The lower gallery is constructed similarly to the grand circle, consisting of fourteen raking cantilevers composed of 15-in. by 6-in. by 59-lb., 16-in. by 6-in. by 62-lb., and 18-in. by 7-in. by 75-lb I-beams reinforced by flange plates, the dimensions of the rakers varying with their length and duty. The cantilevers are built into the outer wall, or secured to the transverse girder at the back of the auditorium, according to position, and pass over the main

Fig. 1.—London Opera House.

l raking girders, as in the case of the con-
action illustrated by Fig. 1. The cantilevers
connected by steel joists for support of the
crete floor slabs.

The lower gallery main girder has inclined
ls to conform with the floor ramp dictated by
ting requirements. This girder has the clear
n of 85 ft., and weighs 41 tons, its dimensions
ng 63 in. deep by 24 in. wide, and, like the
responding member on the circle below,
s built up of structural sections and plates.
raking girders of similar construction
oduced to shorten the span of the cantilevers
gh 9 tons each and have the clear span
12 ft., the average depth of 30 in., and the
th of 14 in. across the flanges.

The main girder of the lower gallery is
ported by two stanchions 45 ft. high, built
b the outer walls.

ix of the raking cantilevers are secured
the back end to a main box girder, with
span of 64 ft., 61 in. deep, 18 in. wide,
lt up of angles, channels, and plates. This
der is carried by two stanchions, and also
ports part of the floor framing at the back
he gallery.

The upper gallery, which is considerably
rower than, and practically a backward
ension of, the gallery below, is composed
nine raking girders supported at the front
by the girder to which the lower gallery
tilevers are attached, and built into the wall
the back.

The proscenium opening is spanned by a
girder 50 ft. long, with the clear span of
ft., 39 in. deep by 18 in. wide, and the fly
lleries, constructed of concrete and steel
ts, are carried by lattice girders, each
ft. long.

Over the stage the roofing is carried by four
in trussed girders of 70 ft. span, 12 ft. 6 in.
p at the centre, these members being
ported at the ends by two trusses with
span of 63 ft. and 12 ft. deep. In
ordance with the requirements of the
ndon County Council the roof is covered
h boards, finished with slates on the outside.
roof trusses also perform the duty of
rying the rib to which the whole of the
nery is slung.

The roof over the main portion of the
ditorium comprises six trussed girders. Five
these members are 10 ft. 9 in. deep by
in. wide, and the sixth is 14 ft. deep by
in. wide. The ends of the trusses are
ported on the side walls of the building.
roof covering consists of 6-in. by 3-in.
ams spaced about 3 ft. apart centre to
tre, encased in concrete and covered with
yer of asphalt. The lower booms of the
sses serve the purpose of carrying the steel
ning of the elliptical ceiling.

Over the gallery the main support of the
roof is a steel plate girder 88 ft. long,
in. deep by 18 in. wide, supported at the ends
the side walls of the building.

With the exception of the combustible roof
ering required over the stage by the London County Council Regulations, all the roofing is of fire-resisting construction, which applies also to the whole of the dressing, wardrobe, property, chorus, and rehearsal rooms.

Finally, it should be mentioned that the heavy exterior cornice of the building is carried by a special arrangement of steel members, with provision for the support of the statuary previously described.

Despite the fact that the London Opera House is in no sense of the term a steel-frame building, some 700 tons of steel have been used on the interior construction, which possesses much interest as an example of modern architectural engineering.

(To be concluded.)

"TESTING OF MATERIALS" USED IN REINFORCED CONCRETE.

On the 7th inst., at a meeting of the Society of Architects, a paper was read by Mr. A. Alban H. Scott on "Testing of Materials Used in Reinforced Concrete." In the course of his remarks he said:—

"The following is an outline procedure I would suggest should generally be adopted with regard to the testing of materials for reinforced concrete work:

All tests to be made at an independent testing and experimental works.

Testing of Cement.—The cement to be tested from samples taken from the bulk, such samples being taken from various positions of the bins at the makers' works. After the cement has arrived on the job samples again taken from various bags, thoroughly mixed and again tested. Further tests made from time to time as the material is being used in the works, the number of these tests being regulated by the quantity of the consignment and the time taken in using same.

All tests on cement should be made in accordance with the latest specification of the British Standard Specification for Portland Cement, with the further test for ascertaining resistance to thrusting stress of both neat cement and also cement and sand in the same proportions used for the tensional briquettes.

Aggregate or Coarse Material.—A sample in bulk to be delivered on to the works, a sample taken and tested:—1st. For freedom from loam and other foreign matter. 2nd. For the proportion of the various sizes of the crushed material. 3rd. For the amount of voids. 4th. For specific gravity. Tests repeated on the material being used in the works from time to time as may be considered desirable.

Sand.—Sand to be treated in exactly the same way as aggregate, and in addition a test for the amount of material that will pass a sieve of $\frac{1}{30}$-in. by $\frac{1}{70}$-in. apertures should be ascertained; this, which can be called "flour," should be rejected.

Water is tested to see that it contains no unusual or injurious properties.

Steel to be first inspected at the makers' works with a view to ascertaining:—1st. Whether welds have been made. 2nd. For surface defects. 3rd. Correctness of diameters.

Every rod of over $\frac{1}{4}$-in diameter must be stamped with a die as having been inspected. Sample lengths are taken from the actual rods, which are duly stamped and sent to the testing works for the purpose of ascertaining:—1st. Their ultimate strength. 2nd. Their elastic limit. 3rd. Their elongation and contracton of area. 4th. To observe the structure of the metal at fracture whether the same is silky or granular. 5th. Bending test.

All these tests to apply to rods and wire from and including $\frac{5}{16}$-in. diameter and upwards.

Concrete.—The test specimens of concrete should be of a standard size of 6-in. cube. Six specimens made for each test, three made in the laboratory and three on the works. The cement for each set of six specimens to be taken from the same consignment. The laboratory tests specimens should be made as far as possible on practical lines, so that the result should be such as can be reasonably expected from concrete in the actual work.

All specimen pieces made on the works should be made from concrete taken from the actual mixing platform. All such specimens should be made in metal moulds, and the concrete worked in by punning and tamping to the same degree as has actually taken place in this structure. Six test cubes should be used for each test, and the minimum tests should be made at the following periods:—Seven days, twenty-eight days, fifty-six days, ninety days, and one year.

For the purpose of record and research work such tests should be carried out at the following periods:—Seven days, twenty-eight days, fifty-six days, ninety days, six months, nine months, twelve months, two years, three years, four years, and five years.

Centering.—No mechanical tests are required for this, but when the strutting is being placed into position rough calculations should be made to see if any undue deflection or movement is likely to take place during the process of placing the moist concrete into position, and inspection made to see that the joints have been properly filled up by rubbing with hard bar soap or other material to prevent dripping of the cement and sand.

We might now consider whether the tests mentioned above are reasonably required, and before proceeding to do so a few remarks on the work the material is called upon to do may not be out of place. In reinforced concrete the concrete takes compression and shear; the steel taking all the tension and assisting for shear and compressional strains. The concrete being stressed to not more than 600 lb. per square inch in compression, and 60 lb. per square inch in shear; the steel in compression in beams not more than nine times per square inch

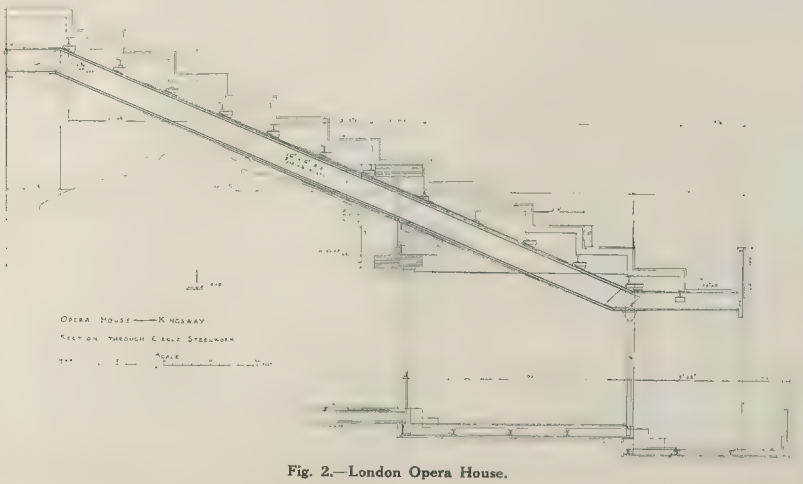

Fig. 2.—London Opera House.

that of the adjoining concrete, and in columns not more than fifteen times that of the adjoining concrete; and steel in tension 15,000 lb. per square inch, and the adhesion of the concrete to the steel 100 lb. per square inch of actual contact.

These figures being subject to various conditions, such as the efficient tying in of the steel in compression to prevent bulging of the rods, proper proportion of metal to the concrete, and spacing of the steel. In the case of columns the effective area of concrete is only taken as that part which is hooped in by the ties to the vertical steel members.

If we are working to a factor of safety of a fourth of the ultimate, the ultimate resistance to thrusting stress of the concrete should not not less than 2,400 lb. per square inch, the resistance of concrete to shear 240 lb. per square inch, and the steel 60,000 per square inch ultimate tensile.

These figures show that all the materials are called upon to be of high efficiency, and to work in harmony and simultaneously together and have been adopted in consideration not only of their ultimate resistance, but also the relative co-efficient of elasticity.

The work is designed on the assumption that the materials actually used in the construction are capable of resisting these stresses.

The following are a few reasons why the author considers the tests necessary:—

Aggregate and Coarse Material.—It has been found that most aggregates (unless washed) contain loam and other foreign matter. A sample of river aggregate recently tested gave as much as 7 per cent. of loam, and most loams have a surprising covering power, being of the very finest of "flour," and consequently when the cement is added there is a thin film between the cement and the actual silicious material, thus preventing the cementing together of the particles.

Some time ago it was advocated in certain quarters that the presence of loam in aggregate did not decrease, but rather increased the strength of concrete. A slight mistake was made there; the material which was mistaken for "loam" actually contained certain cementing properties which had the effect of making the concrete a richer mixture.

With aggregates which are practically uniform in size, or if the various sizes are not properly graded, proper bond is not obtained between the various materials as the mortar is concentrated, and thus a portion of the mixture is deficient in cementing materials; therefore it is most desirable that the grading and voids should be worked out very carefully, and, with certain exceptions, it is found, within limits, that the grading which gives the smallest amount of voids in the aggregate and sand results in concrete of greater strength. With aggregate and sand containing a high percentage of voids a greater proportion of cement is required.

It is possible to arrange these results in various ways, and the following table may be found convenient:—

Size of square apertures in ins.		1	½	⅜	⅛	¼	⅛	1/16	3/32	1/10	Not graded.
	Parts	1	1	1	1	1	1	1	1	1	
1. Thames sand	Perc. of voids	—	—	—	—	39·9	39·0	35·5	34·5	—	
2. Sea sand on shore 26 years		—	—	—	—	26·7	29·5	32·0	—	—	
3. Ordinary Thames sand...		—	—	—	—	—	—	—	—	—	23·3
4. River sand		—	—	—	—	—	—	—	—	—	32·0
5. Sand from crushed rock				—							33·2
6. Crushed rock		40·1		44·1		—	—	—	—		
7. Thames ballast graded ...		38·2	44·5	43·5	42·5	—		—	—	—	
8. Sea ballast		41·8	42·3	41·8	42·0						
9. Ballast and sand as from bank to pass only and not retained on apertures		37·0	38·0	37·6	35·6						
10. Thames sand and ballast not ground	Parts	—	—	—	—	1	1	2	2		
,,		—						32·0			
,,			—	—				28·7			
,,	Parts	1	2	3	4	1	1	2	2		
,,			42·3								
,,				29·3							
,,					25·1						
11. Sea sand and ballast ...	Parts	1	1	4½	3	1½	3½				
,,				29·6							
,,	Parts	1	1	4½	3	1½	1½	3			
,,				23·9							
12. Standard sand				34·5							

In this connexion it should be remembered that as the number or particles increase so the proportion of the cement to the whole should be also increased owing to the greater covering power required. A test cube made with a very small amount of aggregate and a large amount of sand with the usual proportions of cement gave an ultimate resistance to thrusting stress of only about 600 lb. per square inch; such low result was entirely owing to the fact that the usual amount of cement in that case was not sufficient to properly cover each particle of the sand and aggregate, and a perfectly cemented and homogeneous mass was not obtained.

The ultimate resistance of any material is its strength at its weakest point, and the actual area of the concrete is the gross area minus the area of voids at any section; it is therefore necessary that the ascertained percentage of voids in the aggregate and sand should be entirely filled up with cement, withan additional allowance for completely surrounding each particle. The usual rough-and-ready means of determining the exact proportion of the cement to the sand and aggregate has resulted in many cases of disaster.

The specific gravity of sand and cement should be taken in order to compare with the weight of the test specimens, as such weight is materially affected by the original weight of the aggregate and sand. There are at least two methods of ascertaining the amount of voids. One is by ascertaining the specific gravity of the material used; and, secondly, by allowing the aggregate and sand to absorb moisture, then to dry the surfaces without extracting moisture from the material, and then in the test tubes to add water until such time as the level of the aggregate and the water is at the same point.

Water.—The water usually obtained from town supplies can be taken as of proper quality for use in concrete work, but in country districts water obtained from wells and reservoirs often contains foreign matter, such as peat and other vegetables, and it has been found that by using peaty water it retards the setting of the cement; in one case the concrete did not set for a period of three weeks, at which stage the concrete was still very soft and was taken up.

Steel.—In no part of the steel for reinforced concrete should welds be allowed. Welds can be made in various ways, but it is impossible to test each weld, and in these joints it is not an exaggeration to say that not one weld in 500 would be of equal strength to the rest of the bar, and it has been ascertained with most disastrous results that the strength at the point of the weld goes as low as 30 per cent. of the bar adjoining. This is caused not so much by the lack of amalgamation of the material itself, but generally by the fact that large voids are left right in the centre of the joint.

Surface defects in steel are often found in the ordinary commercial bars, being indicated by most minute cracks, generally starting in the shape of a "V." Although such defects are in themselves perhaps almost innocent, yet immediately the material is subject to any stress they develop in a most alarming manner.

It has been found that the diameters of bars vary from that specified, resulting in one case of a loss of 12 per cent. in the area. Excess diameter is also often met with, and as the final measurements are taken on a basis of the correct diameter such excess of diameter will often be the solution of the difference found between the surveyor's measurements and the weight alleged to have been used by the contractor. Reinforced concrete work being designed on the assumption that the whole of the materials employed are exactly in accordance with the specification, a reduction in area of the bars is most serious.

(*a*) The ultimate strength should be taken at not less than 60,000 lb. and not more than 72,000 lb. per square inch.

(*b*) The elastic limit is also of the utmost importance, as although steel might have a high ultimate resistance, the elastic limit might be so low that in case an accidental load is placed on the work a sudden collapse might take place; whereas, by use of material with a proper elastic limit proper warning would be given before its failure.

(*c*) It is essential that steel should be of such properties as will enable it to take a gradual and uniform extension, thus indicating a uniformity of quality; and the contraction of area at fracture should not be less than 40 to 45 per cent., which will confirm the properties of equal extension.

(*d*) A silky fracture indicates a uniformity and a good mild steel so far as the metal, as metal, is concerned. Granular grain indicates brittleness and unequal quality.

Concrete.—Concrete which has its setting somewhat retarded by sprinkling with water gives generally higher results than concrete which was allowed to dry under normal conditions. The question arises here, however, as to the consistency of concrete not only from the point of view of the strength of the concrete itself, but rather as to what consistency will give the best results in actual practice from the point of view of contact with the metal, resistance to crushing, and shear; and although it is essential that as little water as possible should only be used to prevent air-holes occurring after the water has been evaporated, I would feel inclined to use a concrete slightly wetter than the average practice in France, but certainly much drier than the general present use in England.

Comparatively wet concrete will not allow of it being rammed or "tamped"; whereas, to get a drier concrete into its correct position, tamping and gentle ramming is essential. As the whole of the strength of reinforced concrete depends upon proper adhesion of the concrete to the steel, it is an essential factor that the concrete is gently rammed at every point.

The architect has therefore a much better chance of making sure that the concrete is properly placed in position and properly worked between the reinforcing metal, and the greatest trouble has been found to be with contractors wishing to make the concrete wetter than is desirable owing to the fact that a wet concrete is more easily placed in position with much less labour than a dry concrete.

The influence of the percentage of water used is shown in a diagram which is the result of a series of tests which Mr. Kirkaldy carried out for the purpose of arriving at some definite conclusion as to the very debatable point of the efficiency of wet and dry concrete.

The usual period of the first test on concrete has until recently been at twenty-eight days, but with important structures to obtain tests at twenty-eight days after the concrete is made is not going to be of very much use for early correction when the work is being rapidly pushed forward, therefore a seven-day test is essential, so as to be able to immediately detect any error in any of the materials.

At the present moment there are few tests at seven days, so that for the present the reasonable resistance of concrete at this period has not been definitely ascertained (approximately 300 to 400 lb.) Such tests in connexion with the twenty-eight days' tests will also give most useful information with regard to when it is safe to strike the centering, and when one considers the failures that have taken place owing to the centering having been removed too quickly a seven days' test will undoubtedly become a recognised factor very shortly.

The fifty-six days' and ninety days' tests are

rable, as they show what is actually taking be in the work with regard to the increase lecrease in the strength of the structure. he concrete up to about six months of age eases in strength fairly rapidly, but it is ous that from about six to nine months the easing resistance to thrusting stress is very trifling, but after nine months the strength of the concrete again continues to increase at a more rapid rate, although not so rapid as during the first six months.

For the purpose of research work, and where the importance of a job will allow it, it is most desirable that specimen pieces should be made in sufficient number so that each series of specimens are tested up to at least ten years of age. A number of specimens should always be kept, so that if anything should ever happen to any structure or part of same one is in a position to test the concrete, and the steel, of course, could be tested from samples obtained from the actual work.

By the kind permission of Mr. Kirkaldy I am able to give you the actual detailed results of experiments to ascertain the resistance of the thrusting stress on sixty-four cubes made under various conditions at his works.

You will see that there are many things to be learnt from this excellent series of tests. At twenty-eight days the highest result obtained was an average of 2,225 lb. per square inch, and at ninety days the highest result was 3,554 lb. These two results can be taken as being the greatest amount of resistance that can be obtained from concrete made under the most favourable conditions, and it should be compared with the lowest results obtained, which is 1,026 lb. per square inch in twenty-eight days, and 1,787 lb. per square inch in ninety days, with varying results between these two extremes, and the question arises as to which is the most probable result that would be obtained from work in actual practice; in determining this it might perhaps be desirable at the same time to inspect the diagrams showing the results of experiments on concrete taken from the actual mixing platform on several works.

[The remainder of the paper and some notes of the discussion which followed will be given in our next issue.

IGRAM 3.—Results of Experiments to Ascertain the Resistance to Thrusting Stress of Sixty-four Concrete Cubes, Made Under Various Conditions at these Works.

ENGINEERING NOTES.

The Design of High Dams. A meeting of the Concrete Institute was held at Denison House, 296, Vauxhall Bridge-road, Westminster, S.W., on March 14, when Mr. Reginald Ryves, Assoc.M.Inst.C.E., F.R.Met.Soc., M.C.I., read a paper entitled "The Design of High Dams." The paper was limited almost entirely to the consideration of dams more than 150 ft. clear of the ground in height, and of such length of this height that the part under consideration may be regarded as receiving no support from the parts beyond it on higher ground. The author briefly considered four types of masonry dams, one of which is the mass gravity dam, and the other three dams of spans. Of these three two are gravity dams, in which the moment of the water load is balanced by the moment of the weight of the masonry. In one of these, which the author calls the parallel slice dam, the theory of the mass gravity dam is strictly followed, with more or less concentrated water loads; in the other the weights of the spans are wholly or partly counted in calculating moments, and the application of the theory is perhaps affected by the form given to the piers. The third type of dams of spans is the author's thrust buttress type, first designed for a height of 200 ft., but suitable, it is submitted, for much greater heights. It differs essentially from the other types, for instead of balancing moment against moment the author balances direct thrust in the masonry against the direct thrust of the water load.

The Drainage of Egypt. The correspondent of the *Times* sends to our contemporary information of the new scheme of drainage in Lower Egypt inaugurated by Lord Kitchener. As a result of the discussions of the projects which had been prepared—discussions in which, among others, Sir William Garstin and Mr. Webb, former advisers to the Ministry of Public Works, took part, it was decided that a start should be made in the western portion of the Province of Behera and in Central Gharbieh. Schemes dealing with these two portions of the great work have been approved by the Council of Ministers, and the first sod of the first new drain has just been turned by Lord Kitchener. The principal object in view is the improvement of lands where a system of drainage already exists. Incidentally, the execution of the work will lead to the reclamation of nearly 130,000 acres of land at present under water. It is reckoned that the work will be completed in four years, and the cost of execution for each of the two districts is estimated at 1,250,000*l.* This sum suffices only for the work of drainage, and does not include the cost of irrigation of the new lands which will have been dried.

THE BUILDING TRADE.

ACCIDENT POLICIES.

THE case of Allen *v.* London Guarantee and Accident Company, Ltd., recently heard in the King's Bench Division, is of considerable importance to those insured against accidents. The plaintiff, a builder, was insured under what is known as a third party policy—that is to say, against claims by third persons from accidents caused by the plaintiff's servants. An accident occurred, caused by a cart driven by one of the plaintiff's servants, and two men were injured, who both instituted proceedings against the plaintiff to recover damages for the personal injuries which they had sustained.

Under the policy the plaintiff was insured "whenever the insured or a paid and duly authorised driver in the regular employment of the insured was in charge of any horse or horse-drawn vehicle, and injury or damage was caused by such horse or vehicle. . . ." But the policy also contained clauses to the effect that the total aggregate liability of the company was to be limited to the sum of 300*l.* for all claims to compensation and costs, charges, and expenses paid either to the assured or any claimant in respect of any one accident or occurrence, and the company was enabled either to pay down the maximum sum in respect of such liability or at the election of the insured to defend any action, in which case all costs and expenses occasioned by the defence were to be borne by the insured.

The jury awarded 200*l.* to one injured person and 175*l.* to the other, and the legal costs of these persons amounted to 218*l.*

The questions raised in the case were—(1) Whether there was one accident under the policy so that the liability of the company was limited to 300*l.*, or whether the insured was liable for the extra 75*l.* (2) Whether the insured could recover the 218*l.* costs from the company. The Court held that there were two accidents, but only one occurrence, and that the limit on the liability of the company therefore applied. As regards this point, in 1891, the Court of Appeal in South Staffordshire Tramways Company, Ltd. *v.* The Sickness and Accident Assurance Association, Ltd., held that where the overturning of a vehicle had injured several persons there was more than one accident under a policy where the insurance was against "accidents by vehicles," but a limit was expressed to "one accident." The policy we are considering was, however, especially worded with a view to exclude that decision, and the Court has held that that object was attained.

As regards the second point, the Court held that, as the company had defended the actions on its own initiative without the consent of the assured, they were liable to pay the costs incurred by the third parties.

The Insurance Company had not pressed their counterclaim for the extra 75*l.*, so in the result the plaintiff succeeded, but this case illustrates the necessity for careful consideration of the terms of insurance policies—a point which we are always impressing upon our readers.

SAFETY SCAFFOLDING FOR STEEL-FRAME BUILDINGS.

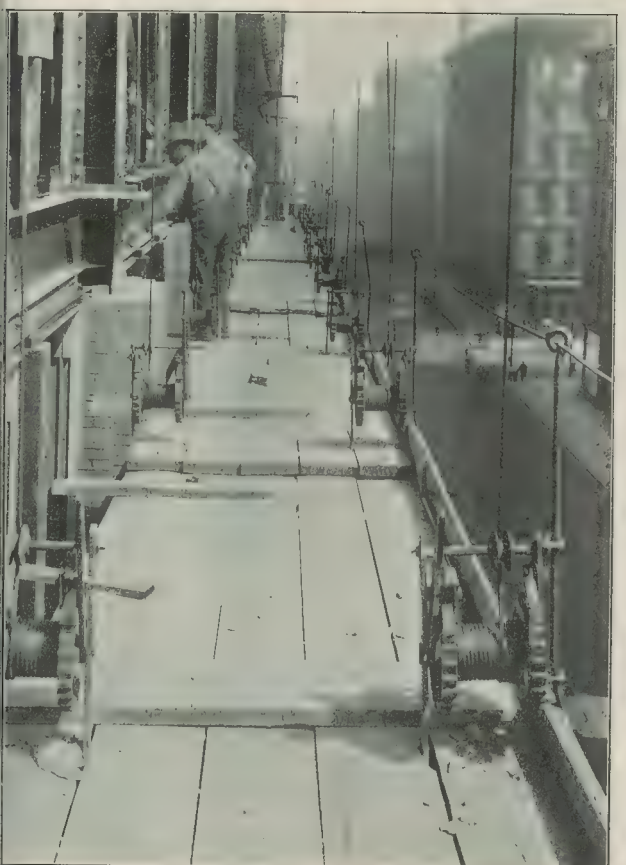
IN an article published on March 10, 1911, we described various improved types of scaffolding for steel-frame buildings, including one devised by the Patent Scaffolding Company, of New York. There is nothing particularly new in the underlying principle, as the scaffolding is merely a development of the well known painter's boat. However, the manner in which this form of scaffolding has been evolved from a rudimentary appliance is quite ingenious and deserving of commendation. The two illustrations now produced will enable our readers to realise the convenience of the apparatus to builders, and the security it affords to bricklayers and labourers.

Fig. 1 represents the construction of curtain walls at two different levels by the aid of suspended scaffolding, and Fig. 2 is a view along the latter, showing the working platform, guard ropes, and winches used for adjusting the height of the platform. The scaffold is formed of sections, each 10 ft. long, suspended by wire ropes bolted at the top to outriggers, and secured at the bottom to a pair of hand winches. To the drum of each winch, ratchet wheels are fitted, these being actuated by a lever enabling the men to raise or lower the section of scaffolding as required. Thus the scaffold is virtually equivalent to a connected series of painter's boats, forming a continuous working platform, providing ample space and conducing to safety and economical construction.

THE FAIR WAGE CLAUSE, CARDIFF.

A DEPUTATION of the Cardiff Master Builders' Association waited upon the Cardiff Public Works Committee recently to protest against the new fair wage clause in Corporation contracts proposed by the Cardiff Trades and Labour Council. The deputation was headed by Mr. J. Gibson, the President of the Association, the other members of the deputation being Messrs. J. E. Turner, William Thomas, T. Price, and Isaac Watkins, the Secretary.

The deputation contended that the proposed alterations were unreasonable and unnecessary, and that there existed at present ample machinery for settling any grievances that might exist as between the master builders and their employees.



Mr. Gibson, who was the first speaker, dwelt upon the first clause, which stipulates that the contractor shall employ only *bonâ-fide* trade unionists for the purpose of executing the works contracted for. This clause, declared Mr. Gibson, was tantamount to asking the master builders to become agents for trade unions, to which they strongly objected. The proposed alterations were unnecessary and unjust.

Mr. William Thomas said that they as builders strongly objected to be made a machine for the purpose of increasing the number of trade unionists, and he did not think that any contractor of any standing would accept a contract under such conditions. There was already in existence a Board of Conciliation set up for South Wales and the West of England, and also a National Board to deal with disputes, and he could not recall a single case where an amicable agreement had not been arrived at by one or other of the Boards since their establishment in 1905.

Mr. J. E. Turner said that the ground upon which the master builders took their stand was that (1) the present clause in the contract agreements met all reasonable requirements; (2) the inspection of the employers' books was altogether unnecessary; (3) that the stipulation that notices of wages should be posted up was also unnecessary; and (4) that to allow the recognised trade union to be the sole arbitrator in cases of dispute was totally unreasonable. The deputation further informed the Committee that new regulations governing

Fig. 1. Patent Safety Scaffolding.

[Photo. by Fuller & Osborne.

Fig. 2. Patent Safety Scaffolding.

ges and conditions of employment would e into operation in May.

aving thanked the Committee for hearing r objections, the deputation withdrew, and matter was referred to a sub-committee for sideration and report at the proper time.

GENERAL BUILDING NEWS.

NEW CHURCH, ROTHERHAM.

r. James Totty, of Rotherham, is the archi- for this church which has been erected in ard-road at a cost of about 3,675*l.* The ding is in the Gothic style, and provides mmodation for over 500 persons.

NEW BUILDINGS IN LONDON.

veloping estate, Putney-hill, S.W.; Messrs. Parry & Co., contractors, Howard's-lane, ney, S.W. Proposed building for East ney High School, Putney-hill, S.W.; ney Public Day School Trust, Ltd. Exten- to Isolation Hospital (3,000*l.*), Barnet, N.: Pill, architect, of Messrs. White, Son, ill, 13, High-street, Barnet, N. Public dry, Kensal-road, Paddington, W. 0*l.*); Mr. E. B. B. Newton, Surveyor, n Hall, Paddington, W.

NEW HOTEL, BLACKPOOL.

new building, to be called the York and caster Hotel, is to be erected on the Pem- e Estate, Claremont Park, and is expected ost about a quarter of a million sterling. architects for the work are Messrs. Charles g & Son, of Spring-gardens, Manchester.

TRADE NEWS.

essrs. Jno. Birch & Co., Ltd., of 2, London -buildings, London Wall, E.C., have ntly secured the order for materials in exion with a new drainage scheme for the City of Fortaleza, Ceará, Brazil. The order includes some 16,000 tons of cast-iron pipes and about 4,000 tons of stoneware pipes, together with the requisite valves, sluice gates, and accessories. The value of the contract is, approximately, 160,000*l.*

Under the direction of Mr. Harold R. Hooper, architect, Ipswich, Boyle's latest patent "air-pump" ventilators have been applied to the theatre, Harwich.

The additions to the Farnham Workhouse are being supplied with Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

We are informed that Messrs. Stephens & Carter, of Paddington Green, ladder and barrow makers and scaffolding contractors, have purchased the old-established business of Messrs. Ell & Co. They are transferring the business recently carried on by Messrs. Ell & Co., at Bridge Wharf, Paddington, to their Paddington Green-yard, but are keeping on and enlarging the yard at Kennington-road.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses) :—

Finsbury, East.—Erection of a building on the eastern side of Dingley-road, Finsbury (Messrs. Yetts, Sturdy, & Usher for Messrs. T. Wallis & Co., Ltd.).—Consent.

Finsbury, East.—Erection of buildings upon a site abutting upon the southern side of City-road, the western side of Nelson-street, and the eastern side of Dingley-road, Finsbury (Messrs. Yetts, Sturdy, & Usher).—Consent.

Fulham.—Bay-windows and porches to houses on both sides of Ellaline-road and Larnach-road, Fulham (Mr. F. L. Poole for Messrs. Allen & Norris).—Consent.

Hampstead.—Erection of buildings on the south-western side of Haverstock-hill, Hampstead, south-eastward of Belsize-lane (Messrs. W. Woodward & Sons).—Consent.

Hampstead.—Erection of a motor garage at the rear of No. 53, Hollycroft-avenue, Hampstead, next to Ferncroft-avenue (Mr. S. C. Lathbridge for Captain G. A. Ballard, R.N.).—Consent.

Hampstead.—Addition to a one-story motor house at No. 8, Lindfield-gardens, Hampstead (Messrs. L. Solomon & Son for Mrs. B. Rosenfeld).—Refused.

Islington, West.—One-story shop in front of No. 257, Caledonian-road, Islington, abutting also upon the northern side of Freeling-street (Boot's Pure Drug Company, Ltd.).—Consent.

Islington, West.—Projecting entrance gateway at the entrance to Albion-yard, on the western side of Albion-street, Islington (Mr. G. Langford).—Consent.

Kennington.—Three one-story shops on the southern side of Lansdowne-road, Kennington (Messrs. Hulbert & Haysman).—Consent.

Marylebone, East.—Iron and glass hood at No. 21, New Cavendish-street, St. Marylebone (Mr. J. P. Williams for Dr. Forbes Ross).—Consent.

Norwood.—Addition to the General Post Office sorting office building on the northern side of Cornwall-road, Brixton (Messrs. E. Evans & Sons).—Consent.

St. George, Hanover-square. — Projecting clock at No. 34, Old Bond-street, Westminster (Greenwich Time, Ltd., for Messrs. Dodson).—Consent.

Wandsworth.—Erection of porches and gables, with bargeboards, in front of twenty-three houses on the south-eastern side of Longstone-road, Streatham (Mr. H. H. Foster for Messrs. Humphreys & Allen).—Consent.

Wandsworth.—Bay-windows and gables to houses on both sides of Salterford-road, Wandsworth, southward of Welham-road (Messrs. Swain & Selley).—Refused.

Westminster.—Projecting one-story shop at No. 165, Victoria-street, Westminster (Messrs. Z. King & Son for Mr. R. T. Raikes, Mr. H. Hiscox, and Louise Lean).—Consent.

Width of Way.

Bethnal Green, South-West.—Erection of buildings on the western side of Coventry-street, Bethnal Green (Mr. P. K. Allen for Messrs. Allen & Hanburys, Ltd.).—Consent.

Lines of Frontage and Projections.

Chelsea.—Erection of a cottage at the rear of Nos. 111 to 115, Fulham-road (Messrs. Elms & Jupp).—Consent.

Chelsea.—Erection of a building on the western side of Little Cadogan-place, Chelsea, at the rear of No. 65, Cadogan-place, and at less than the prescribed distance from the centre of the roadway of Little Cadogan-place (Messrs. W. D. Hodges & Co., Ltd.).—Refused.

St. George.†—Two one-story buildings on the eastern side of Hungerford-street, Commercial-road East (Mr. A. Calver).—Consent.

Width of Way and Lines of Frontage.

St. George, Hanover-square.—Addition at No. 9, Lyall-mews, Westminster (Messrs. C. Bowden & Co.).—Refused.

Width of Way and Construction.

Greenwich.—Open shed of a temporary character on the northern side of North-street, Charlton (Mr. F. Elleston).—Consent.

Lines of Frontage and Construction.

Holborn.—Iron and glass shelter at the entrance to the British Museum Tube Station, High Holborn (Mr. E. P. Grove for the Central London Railway Company).—Consent.

Mile End.†—Projecting crane at Crown Works, Bancroft-road, Mile End (Mr. J. M. Knight).—Refused.

Line of Frontage, Space at Rear, and Projections.

Kensington, North.—Erection of houses on the western side of Highlever-road, Kensington, northward of Oxford-gardens, with a flank abutting upon Oxford-gardens (Mr. G. Holmes for Mr. W. Osborn).—Consent.

Alteration of Buildings.

Chelsea.—Additional story at No. 103, Cheyne-walk, Chelsea (Messrs. Webster & Cannon).—Consent.

Kensington, South.—Alterations at No. 21, Church-street, Kensington (Messrs. C. Spreckley & Co., Ltd., for Messrs. Hookins & Johnson).—Consent.

Deviation from Certified Plans.

City of London.—Re-erection of No. 7, Lovelane, City (Mr. H. E. Quick for Mr. H. P. Edwards).—Consent.

Formation of Streets.

Kensington, South.—Formation or laying-out of a street for carriage traffic in continuation northward of Abbotsbury-road, Kensington (Messrs. Drivers, Jonas, & Co., for the trustees of the Holland Park Estate).—Refused.

Newington, West.—Formation of a new street for carriage traffic to lead from Albertastreet to Delverton-road, Newington (Messrs. Briant & Son).—Consent.

Cubical Extent.

Marylebone, West.—Conversion of the Portman-market, Church-street, St. Marylebone, into a garage (Mr. P. C. Middleton).—Refused.

Uniting of Buildings.

Camberwell, North.—Use of double doors of special construction in lieu of double iron doors to openings in a division wall at premises in Blucher-road, Camberwell, adjoining the London, Chatham, and Dover Railway (Messrs. G. Trollope & Sons and Colls & Sons, Ltd.).—Consent.

City of London.—Formation of an opening between Nos. 7 and 8, Aldgate High-street, City, at the first-floor level (Messrs. C. Spreckley & Co., Ltd.).—Consent.

City of London.—Uniting of No. 6, Edmundplace and No. 11, Hamsell-street, City (Mr. J. Farrer for Messrs. W. Wood & Son, Ltd.).—Consent.

Clapham.—Formation of openings between Nos. 26 and 28, High-street, Clapham, at the ground, first, second, and third floor levels (Mr. J. W. Stevens for Messrs. Williamson & Cole).—Consent.

Hampstead.—Uniting of Nos. 247 and 249, West End-lane, Hampstead, at the basement level (Mr. J. Luck for Messrs. Morrell Brothers).—Consent.

Holborn.—Formation of openings in the party walls at the first, second, third, and fourth floor levels between Nos. 100 and 101, and between Nos. 101 and 102, Hatton-garden, Holborn (Mr. J. Sawyer for Mr. A. W. Gamage, Ltd.).—Consent.

Hoxton.—Uniting of Nos. 265 and 267, Hoxton-street, Shoreditch (Mr. H. Shienberg).—Consent.

Kensington, South.—Uniting of Nos. 3 and 5, Bedford-gardens, Kensington (Mrs. I. Barrett).—Consent.

Marylebone, West.—Formation of openings in the party wall, between Nos. 75 and 76, High-street, St. Marylebone, at the ground and first floor levels (Mr. A. J. Hopkins for Messrs. J. A. Michell, W. Eastman, and Messrs. Biscuits Guillout).—Consent.

Paddington, South.—Uniting of Nos. 44 and 46, Inverness-terrace, Paddington (Mr. W. L. Gimson).—Consent.

Strand.—Uniting of Nos. 57 and 59, Regent-street, so far as relates to alterations with regard to the staircases and staircase approaches (Messrs. Emden, Egan, & Co.).—Consent.

The recommendations marked † are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ALDERSHOT.—Hippodrome; Mr. Bertie Crewe, architect, 75, Shaftesbury-avenue, W.C.

Bangor.—Workhouse infirmary (15,000*l.*); Mr. B. Lumb, builder, Todmorden.

Bedford.—Rebuilding furniture warehouse; Messrs. Usher & Anthony, architects, 81, St. Paul's-square, Bedford.

Bognor.—School; Mr. W. T. Barlow, architect, Arcade-chambers, Bognor.

Bournemouth.—Savoy Hotel; Messrs. Creek, Gifford, & Oakley, architects, Hinton-chambers, Bournemouth; Messrs. George & Harding, builders, St. Paul's lane, Bournemouth.

Bradford.—Proposed extensions to Central Baths Hall (9,000*l.*); Mr. R. G. Kirkby, architect, Town Hall, Bradford.

Brighton.—Workhouse nurses' home; Mr. J. W. Hawker, Court-chambers, North-street, Brighton. Picture palace, also additions to hotel; Mr. A. Carden, architect, 75 and 76, North-street, Brighton.

Caerphilly.—Council offices; Mr. J. H. Phillips, architect, Pembroke-terrace, Cardiff.

Clydebank.—Carnegie library (10,000*l.*); Messrs. Gardner & Whyte, architects, Glasgow.

Croydon.—Extensions to mental hospital (35,000*l.*); Mr. George F. Carter, Engineer, Town Hall, Croydon.

Doncaster.—Lecture hall (2,650*l.*); Messrs. Sprakes & Sons, builders, 37, East Laithgate, Doncaster.

Dunblane.—Hospital and gymnasium at Queen Victoria Military School (6,500*l.*); Mr. Bernard Reynolds, builder, 27, Randolph-terrace, St. Ninians, Stirling, N.B.

Easington.—Extensions to Thorpe Hospital; Mr. J. M. Lougden, Surveyor, Easington Rural District Council.

Eccles.—Extensions to boiler house at Electricity Works (2,035*l.*); Mr. N. H. Hacking, architect, Derby-chambers, Blackfriars-street, Manchester.

Folkestone. — Harvey Grammar School (7,510*l.*); Messrs. G. Castle & Son, builders, 2, Broadmead-road, Folkestone.

Hastings.—Medical baths; Messrs. Richardson & Gill, architects, 46, Great Russell-street, W.C.

Hove.—A plan has been passed for alterations and additions to No. 201, Church-road for Messrs. J. Parsons & Sons for the London and Provincial Bank. Plans have been lodged for a theatre, Holland-road, by Messrs. Gilbert & Constanduros, and for a bakery, Kingsthorpe-road, by Messrs. Price Brothers.

Ilfracombe.—Free library (2,000*l.*); Mr. O. M. Prouse, Surveyor, Town Hall, Ilfracombe.

Langley (Bucks).—Bacon factory; Messrs. Fassnidge & Son, builders, 42-4, St. Andrew's, Uxbridge.

Leatherhead.—School (8,090*l.*); Messrs. Roll & Taylor, builders, High-street, Epsom. School; Messrs. Jarvis & Richards, architects, 10, Queen Anne's-gate, S.W.

Liverpool.—Cathedral chapel, Blackburn-place (10,000*l.*); Mr. Matthew Honan, architect, 36, Dale-street, Liverpool.

Manchester. — Enlargement of Council chamber; Mr. Henry Price, architect, Town Hall, Manchester.

Rotherham.—The following plans have been passed:—Seven houses, Albion-road and William street, for Dr. J. W. Fox; alterations and additions to 306, Doncaster-road, for Messrs. Tennants Brewery Company, Ltd.; Empire Palace, Masborough-street, for the Masborough Empire Palace Syndicate; variety theatre, Masborough-street, for the Masborough Palace of Varieties, Syndicate. A plan has been lodged for six houses, Hatherley-road and Selwyn-street, for Mr. J. H. James.

Rutherglen.—Manse, Parish Church (2,500*l.*); Mr. H. E. Clifford, architect, 225, St. Vincent-street, Glasgow.

Salford.—Extensions to workshops, stores, and booster-room (1,075*l.*); Mr. John Ramsbottom, builder, Church-street, Pendleton.

* See also our list of Competitions, Contracts, etc., on another page

LONDON COUNCILS.

Battersea.—The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted for a supply of ¾-in. sectional hardwood blocks at 12*l.* 5*s.* per 1,000 for paving the carriageway of St. John's-road between Northcote-road and Messrs. Arding & Hobbs' premises. The estimated cost of this work is put at 2,075*l.* The footways of the portion of the road mentioned are to be repaved with 2-in. artificial stone at an estimated cost of 448*l.* The Borough Surveyor has been instructed to prepare an estimate with a view to the making-up and paving part of Clapham-common, West Side, with tar slag macadam for the carriageway, and 2-in. artificial paving and tar-paving for the footpaths. Repairs are to be carried out to a portion of Wycliffe-road at an approximate cost of 100*l.*

East Ham.—Plans submitted by the Engineer have been approved for constructing an underground convenience at the junction of Barking-road and Green-street at an estimated cost of 1,800*l.* Plans have been passed for Messrs. Clemens Brothers for the conversion of premises, Poulett-road, into a factory. Mr. G. A. Smith and the Rev. Chapman have lodged plans for an addition to "Denmark Arms" public-house, High-street North, and for an assembly hall at the rear of St. Edmund's Church, Halley-road, respectively.

Greenwich.—The London County Council is to be asked to consider as to preparing a town-planning scheme to embrace the whole of the undeveloped land within the Borough. Plans have been passed for Mr. E. Mills for the erection of additions to the Kentish Steam Laundry, Charlton-lane.

Hackney.—Plans have been passed for Messrs. Edmondsons, Ltd., for four houses in Stamford-hill. For the erection of a building at No. 210, Lower Clapton-road, plans have been lodged by Messrs. J. Garey & Son on behalf of Messrs. F. W. Glover & Son.

Lewisham.—Tenders are to be invited for paving and forming Sangley-road-passage. The tenders of Mr. J. T. Gloag and the Atlas Stone Company, Ltd., have been accepted, the former at 489*l.* for kerbing, channelling, and making-up the roadway of Collingtree-road, Sydenham, and the latter for paving the footways of such road with artificial stone at 3*s.* 9*d.* per yard super. Plans have been passed for Mr. G. H. Paine for the erection of four houses in Perry Rise.

FOREIGN AND COLONIAL.

Building in Austria-Hungary.

The following notices are taken from the *Zentral Anzeiger für das öffentliche Liefer ungswesen* (Vienna) of March 3:—The Town Council of Vienna have approved the plans for the erection of a large mixed school in the 14th district at a cost of 960,000 kronen (40,000*l.*). A company has been formed, under the ægis of the Anglo-Austrian Bank, with a capital of 5,000,000 kronen (208,300*l.*), for the purpose of erecting a sugar factory in Cservenka (Hungary). Work is to be begun in the autumn.

Business Opportunities in Western Canada.

The following remarks form part of a letter from a well-known municipal official in one of the largest and most progressive towns of Western Canada, which was received lately by Mr. Beecher Smith, of Manchester:—"Our building for 1911 exceeded five million dollars, and I am safe in saying that this year building will be considerably greater. Now, in the past, our chronic difficulty has not been to provide work for men, but to provide men for the work, and the problem promises to be more acute than ever during the coming season. We can do with all the good tradesmen that you can send. There is always a good opening for a good tradesman in this western country, and his best plan would be to come out here and call upon me immediately he arrives. I shall then have pleasure in taking him by the hand and doing what I can for him. He is quite safe in coming. Our Home Re-Union Association reduces to quite a trifling consideration the separation from his wife and family of the honest working man who has only sufficient means to bring himself out here. Lots of men have children of working age who could earn in this country five or six times the wages paid them at home. In addition to his own good wages and sure work, a tradesman can now bring his family here, and by means of the united effort make a very handsome living and save a great deal of money. We know that you will send us nothing but the right class of people, and I feel satisfied that you know that these people will be helpfully handled into good situations."

Opera House, Wellington.

H.M. Trade Commissioner for New Zealand reports that arrangements are being made for the erection of a new opera house at Wellington, at a cost of about 25,000*l.* Plans are being prepared for the construction of an up-to-date theatre, capable of accommodating between 1,700 and 2,000 people, at Wanganui.

Theatre, Russia.

With reference to the notice on p. 580 of the *Board of Trade Journal* of December 21 last relative to the proposed construction of a theatre at Yurieff (Dorpat), H.M. Consul at Riga (Mr. V. H. C. Bosanquet) reports that according to the local press, the Artisans' Union at Yurieff have resolved to construct a new building, including premises for a theatre, at an estimated cost of about 210,000 roubles (about 22,000*l.*). The address to which communications should be sent may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall street, London, E.C.

Building in British Columbia.

The Imperial Trade Correspondent at Vancouver (Mr. P. G. Shallcross) reports that by-laws have been passed in a town in British Columbia authorising expenditure as follows:—High school building, 103,000 dollars (about 21,000*l.*); public schools, 97,000 dollars (about 20,000*l.*); general purposes, 165,000 dollars (about 34,000*l.*); sewerage works, 115,000 dollars (about 23,600*l.*). The name of the municipality in question may be obtained by British manufacturers and contractors on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

SCALE OF FEET

OPOSED RESIDENCE FOR UNIVERSITY MEN.

has been suggested that the bachelor ent of Oxford and Cambridge men in Hon might be profitably drawn together he provision of a residence on the out- s of the metropolis similar in plan and estic administration to that of the col- s, and in which the cost of living would omparable with the average cost of board lodging in London. The social advan- s of the community system, the oppor- ty for athletics, the freedom from the ries of catering and a foreknowledge of expenses involved, would, it is believed, al to many undergraduates about to com- their university careers, to whom the tion and uncertain character of lodgings ent an outlook that is by no means active.

ne improved and extending facilities for sit in London and its suburbs admit at present time of considerable freedom in choice of a place of residence, and there- the field for the venture in question is h wider than has hitherto been the case.

order to obtain information as to the ncial status of the scheme it has been ssary to prepare more than usually com- e sketch plans to a scale of $\frac{1}{8}$ in. to 1 ft., ing the floors and elevations of the ding throughout. Initially a design was ared in the Tudor style of architecture, finally a quiet Georgian treatment was ted. The buildings, simple and sym- ical in arrangement, form three sides of urt 170 ft. square, open on the south, consisting of two floors above the nd. The main entrance is upon the n front, and on this façade, some ft. in length, are placed the adminis- ve and public rooms, while facing the on the south, and extending the e length of the building, is a cloister to the hall, smoking-room, and common- , and therefore forming an agreeable enlargement of these rooms in the summer months. The first floor of this block is occupied by sets of residential apartments. On the attic floor some similar suites and a billiard-room containing two tables find a place on the west, while, duly isolated, on the east are the servants' quarters and porter's flat.

The two wings of the building, entirely devoted to residential quarters, contain sixty out of the total seventy-five suites of apartments. These rooms are approached by staircases from the court, and resemble in arrangement ordinary college buildings, good sanitary accommodation and separate access to the bedrooms being provided. The desirability of a lavish supply of bathrooms throughout has been realised, and the supply of hot water direct to the bedrooms should do much to reduce the cost of domestic service.

All the rooms contain open fireplaces, though a limited amount of supplementary heating will be effected, where necessary, by hot-water radiators.

The kitchen premises adjoin the hall on the ground floor, and the necessary cellarage is provided under the servants' hall and pantry on the north-east.

The area occupied by the building, including a margin of 10 ft. between the boundaries and the building frontages, is $1\frac{1}{4}$ acres, and the court laid down with grass will provide for three lawn tennis courts and for bowls.

One and a half acres are, however, included in the estimates, the additional ground giving room for two cricket nets and a fives court to be subsequently erected if required.

The building includes seventy-five sets of keeping and bedrooms, the former averaging about 13 ft. by 12 ft., and the latter, perhaps, 12 ft. by 12 ft. Bathrooms in the proportion of nearly two to every three residents, some private, others common to two suites, adjoin these rooms. The dining-hall and common-room each measure 38 ft. by 18 ft.; the smoking-room 26 ft. by 16 ft.; the billiard-room 38 ft. by 24 ft., and the remaining provisions include some spare rooms for guests, rooms for the bursar and housekeeper, and good kitchen and servants' quarters. The cost of furnishing throughout has been considered, but it is thought that it might perhaps be desirable to let unfurnished a certain small proportion of the residential apartments.

THE ENGLISH HOUSE FROM THE NORMANS TO THE TUDORS.*

Houses of the XIVth Century.

"The majority of the lesser houses of the XIVth century are built upon the same or similar lines to those that preceded them.

That at Markenfield, Yorks, an almost perfect example, for which the licence to crenellate was granted in 1310, somewhat resembles Little Wenham. It consists of two blocks built at right angles to each other. The one has the kitchen and cellars on the ground floor and a hall and great chamber above, with appendant garderobe block, and the other the servants' department, with a chapel and another chamber above. This chamber, which can also be reached by a vice from the courtyard, seems in later times to have been made into two stories, and the same has happened to the great chamber. But the original aspect of the house is otherwise maintained, and the beautiful tracceried windows that lighted the hall and the chapel are still quite perfect.

Another house, somewhat later in date, but of similar plan, exists at Meare, in Somerset. In one block is the hall, over a cellar and servants' hall, and in the other the kitchen, with a large solar above. Brinsop Court, Herefordshire, is another interesting house with a fine upstairs

* In continuation of a lecture by Mr. W. H. St. John Hope, delivered at Carpenters' Hall, London-wall, recently, the first part of which was given in our last issue, p. 303.

hall of early XIVth century date, but it is at present somewhat obscured by later additions. The open timber roof is of peculiarly striking character.

The prior's house at Ely, now the Deanery, is an example of intermediate date, having been built by Prior John Crauden in 1325-6. Its principal remaining features are the hall, etc., and a very beautiful chapel, all raised upon sub-vaults disposed at right angles to each other.

The house, now also the Deanery, of another Benedictine dignitary, the Abbot of Westminster, belongs to the class under notice. It consists of the Norman solar and chapel, raised above the vaulted entry to the cloister, and having attached to it on the south-west the old hall and its kitchen. The latter now serves the new hall, built over cellars along the west side of the court by Abbot Nicholas Litlington, between 1370-80; the house was at the same time remodelled and connected by a gallery with the Jerusalem or great chamber at the north end of the new hall. The Jericho parlour and rooms over, now forming the north side of the court about which the house is built, were added by Abbot John Islip early in the XVIth century.

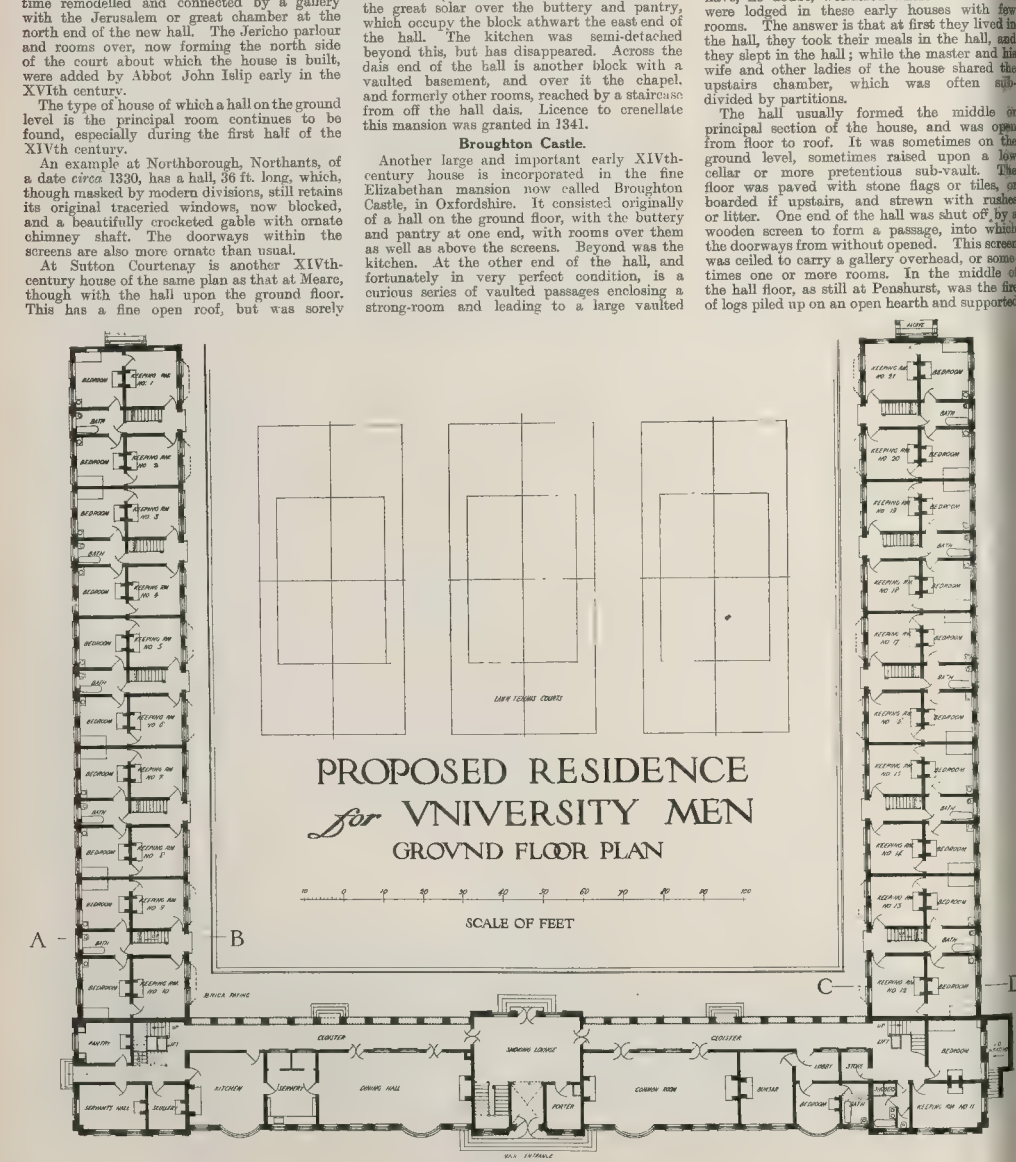
The type of house of which a hall on the ground level is the principal room continues to be found, especially during the first half of the XIVth century.

An example at Northborough, Northants, of a date *circa* 1330, has a hall, 36 ft. long, which, though masked by modern divisions, still retains its original traceried windows, now blocked, and a beautifully crocketed gable with ornate chimney shaft. The doorways within the screens are also more ornate than usual.

At Sutton Courtenay is another XIVth-century house of the same plan as that at Meare, though with the hall upon the ground floor. This has a fine open roof, but was sorely maltreated a few years ago, when the original windows and other features were destroyed. At right angles to its upper end is a contemporary wing with rooms on the ground floor, and the solar and other rooms above. The solar retains its windows and roof, but is now sub-divided, and the roof is in the last stage of decay through being eaten by worms. There is a corresponding wing of later date at the opposite end of the hall, which contains the kitchen and offices, with chambers over, but these have been much altered.

Penshurst.

Lord de Lisle's magnificent house at Penshurst has for its heart an almost complete dwelling of the middle of the XIVth century. It consists of a fine hall on the ground floor, intact even to its roof and the hearth for the fire, with porches covering the doorways at each end of the screens. The north porch has a chamber over. The south porch contains a large staircase to the great solar over the buttery and pantry, which occupy the block athwart the east end of the hall. The kitchen was semi-detached beyond this, but has disappeared. Across the dais end of the hall is another block with a vaulted basement, and over it the chapel, and formerly other rooms, reached by a staircase from off the hall dais. Licence to crenellate this mansion was granted in 1341.



Broughton Castle.

Another large and important early XIVth-century house is incorporated in the fine Elizabethan mansion now called Broughton Castle, in Oxfordshire. It consisted originally of a hall on the ground floor, with the buttery and pantry at one end, with rooms over them as well as above the screens. Beyond was the kitchen. At the other end of the hall, and fortunately in very perfect condition, is a curious series of vaulted passages enclosing a strong-room and leading to a large vaulted sub-hall beneath the great chamber. Next to this is a broad flight of steps up to the chapel, which joins on to the north end of the great chamber. The chapel has a beautiful east window, and retains its stone altar. The great chamber has rooms west of it, over the vaulted divisions below, and another block on the south-east with garderobe tower attached. All this end of the house, except the chapel, which is carried up to the full height, has an upper story as well, and on the space, formerly open, east of the chapel staircase another three-storied block was added in the XVth century. The upper part of the hall has given place to an added Elizabethan story, and has been otherwise altered.

How Houses were Used.

This seems a convenient moment for saying a few words about the way in which such houses as I have described were used. Some of you have, no doubt, wondered where the servants were lodged in these early houses with few rooms. The answer is that at first they lived in the hall, they took their meals in the hall, and they slept in the hall; while the master and his wife and other ladies of the house shared the upstairs chamber, which was often sub-divided by partitions.

The hall usually formed the middle or principal section of the house, and was open from floor to roof. It was sometimes on the ground level, sometimes raised upon a low cellar or more pretentious sub-vault. The floor was paved with stone flags or tiles, or boarded if upstairs, and strewn with rushes or litter. One end of the hall was shut off by a wooden screen to form a passage, into which the doorways from without opened. This screen was ceiled to carry a gallery overhead, or sometimes one or more rooms. In the middle of the hall floor, as still at Penshurst, was the fire of logs piled up on an open hearth and supported

Design by Messrs. A. W. S. Cross, F.R.I.B.A., and Alan E. Munby, A.R.I.B.A. *(See previous page.)*

fire-dogs, or burnt in a metal brazier; the ke ascended to the roof and escaped as best ould through an open lantern above the fire. he lesser halls there was a chimney for the in one of the side walls, having over it a e or plaster hood, or sometimes an orna- ntal "chimneypiece." At the upper end of larger halls was the dais, a platform one or steps high, on which stood the high table the master and his family and persons of lity. The other tables were arranged along side walls, and were long and narrow, tding upon trestles and set in front of nches against the walls. The hall roof was pen carpentry work, according to the fashion he time, and covered with tile, shingle, or ch. The windows were generally of two oled lights, with tracery in the head, and ded part way up by a transom. Above this openings were glazed, either in frames ged into a rebate or, in later times, in grooves in the stonework, while the lower part was ttered only. The sill had a deep recess cut of the middle, so as to form a seat on each . The walls were plastered and lime- hed or ochred, and sometimes decorated n colour, or covered up to some height n wainscoting, which was almost always uted.

r the entrance passage, or "screens," as it and still is called, were doorways opening the buttery and pantry, with a passage ween leading to the kitchen; the kitchen f was generally semi-detached in order to in plenty of room with ample height and t. Over the buttery and pantry was the r or great chamber of the master and his ily; but in course of time this was transferred he other end of the hall and enlarged in ous ways, and its former place taken by a n or rooms for the servants.

Fortifications.

uring the XIIIth, XIVth, and XVth uries few houses of importance were built out being fortified in some way, either by houses or walled enclosures or by merely ing battled parapets. Before this could be a formal "licence to crenellate," or fortify building with *crenelles* or battlements, had e obtained from the Crown. Since these n refer to buildings still existing they are pecial interest as giving the approximate s when such were bogun.

Castle-like Houses.

the last quarter of the XIVth century ngs a group of large castle-like houses built n an entirely new plan, consisting of ranges chambers disposed about a rectangular tyard, with lofty towers at the outer corners. earliest in date seems to be Scotney, in t, the owner of which obtained licence to ellate in 1377. Other notable examples are on, in Wensleydale, dating from 1379-80; ling, in Kent, and Wressle, Yorks, from 1380; iff Hutton, in Holderness, from 1381; ham, in Kent, from 1385-6; and Lumley, Durham, from 1392-3. It is interesting ote that the moated Kentish examples have ded corner towers, while all the north- try unmoated examples, like Bolton, ssle, and Lumley, have the corner towers angular. Middleham is another example e type, but singular in having the ranges of nbers built about the great tower of the nan castle. This contained a fine hall and r good rooms on the first floor, which inued in use. Whether and in what way e fine and well-defended houses were ved from great towers like those at Middle- and Hedingham it would take too long now iscuss, but they were certainly a great nce in the direction of more comfort and acy, and carefully planned to that end. of them, unhappily, are more or less ruined, penalty for the part they were able to play ng the Great Rebellion, but Lumley has s been lived in, and is still perfect. Bolton, is nearly perfect, and in part retains its s and roofs. In the east side is a strong ouse, and the basement stories about the were massively vaulted throughout. hall occupied all the north side of the first and had the kitchen in the tower east of Opposite the hall was the chapel. The es were three stories high, and the towers ined four stories of chambers above the ed basements. There was thus ample for the lord and his family, his guests, he servants.

land, in his "Itinerary," writes of Bolton "the castell standithe on a roke syde; and all the substaunce of the lodgyngs in it be included in four principall towres. Yt was an eighteen yeres in buildynge, and the expencis of every yere came to 1,000 marks," or 12,000*l.*, an enormous sum for the time. Leland continues: "One thinge I much notyd in the haulle of Bolton, how chimeneys were conveyed by tunnells made on the syde of the wauls betwixt the lights in the haull, and by this meanes, and by no lovers, is the smoke of the harthe of the hawle wonder strangely convayed." This curious contrivance, which may yet be seen, does not seem to have been tried elsewhere, and henceforth the great chimney in the side of the hall became general. The contract for building one-half of Bolton still exists, and was made between Sir Richard le Scrop and John Lewyn, mason, in 1379. The work was to cost 100*s.* a perch, measured by 20 ft. to the ell.

Houses of the XVth Century.

The lesser houses of the XVth century differ but little from those of the preceding period, except in the greater importance of the ranges of chambers at either end of the hall and the frequent addition to the hall itself of a new feature in the form of the bay window. This was usually built out at one end of the dais, but in large houses a second was often added opposite the other. The bay was square or half octagon in plan, and its ceiling frequently a richly-groined vault. The recess contained a sideboard for the display of plate and for carving at, and often served also as a passage to rooms behind the hall or to the cellar beneath it.

The oriel window was another charming architectural feature which became common in the XVth century, though introduced earlier. Two beautiful examples may be seen at Great Chalfield. It was perhaps suggested by the sill seats of the XIIIth and XIVth century hall and solar windows, and the mere corbelling out of such windows would produce a common type of oriel. Rounded and half hexagon oriels also occur; but, whatever their plan, they are always, like the bay, most ornamental features to the outside of a house.

We have, happily, an abundance of examples of XVth century houses of all dates, and it is somewhat difficult to pick out typical illustrations of them.

Houses of the hall type are still to be found. Great Chalfield, Wilts, is a beautiful example, *circa* 1440, as is the similar planned house at Norrington in the same county. South Wraxall, another fine Wiltshire house, was built about 1450, and has a detached chapel and later additions. The gatehouse has a good oriel.

The Courtyard House.

In the XVth century is also to be found, in its full development, the courtyard house. This delightful type, in which our country is so rich, was brought about by an interesting process of evolution.

Starting with the early form of house of simple rectangular plan, of which the principal room was the hall, we have seen it expanding into a T-shaped or L-shaped block by the growth of the chambers over the buttery and pantry. Next comes the transfer of the solar with its undercroft to the far end of the hall, and its extension by the addition of a chapel and other rooms. We thus get a house occupying three sides of an open court. The joining of the ends of the wings by a wall turned the court into a courtyard, which was often entered through a gatehouse. It only needed the addition to this of flanking chambers extending to the side wings to complete the type of courtyard house at which we have now arrived.

This type differs materially from the Bolton and Bodiham group in being more strictly domestic, for though the larger houses continue to be protected by walls and gatehouses, or by moats and ditches, the invention of artillery had long made these but a pretence at fortification. Even the frowning front of Hurstmonceux could not have withstood for long the destructive pounding of cannon shot.

The size of these houses varied with the social status of the owner, and many had entrance gateways of considerable architectural merit.

Haddon Hall.

The most fascinating, perhaps, of all our courtyard houses, apart from its delightful situation, is surely Haddon Hall, in Derbyshire.

It had its beginnings in a Norman chapel, which still occupies its southern angle. This chapel adjoined the house of the lord of the manor, who had leave from King John to enclose both with a wall. The original house was apparently taken down in the XIVth century, and the courtyard sub-divided by building across it the existing hall and its perfect set of offices. The entrance was through a strong gatehouse on the north, and by degrees both courts were built about with two-storied ranges of XVth and XVIth century lodgings, forming as a whole such a combination as cannot easily be paralleled.

Winfield Manor House.

Another fine house of similar plan also exists in Derbyshire, at South Winfield. Unlike Haddon, which is still perfect and quite habitable, though not so used, Winfield Manor House is only a ruin, but it is nevertheless of very considerable interest. It has a large outer court, entered through a gatehouse, and built about with stables and farm buildings, some of which are standing. The inner court is entered through a second gatehouse set in the middle of a transverse range. Opposite to this, and forming the north end of the house, is the great hall and its adjuncts. The hall has a beautiful porch, and an equally fine bay window, within which is the stair down to a vaulted cellar extending under the hall. Within the screens are the usual doorways to the buttery and pantry, above which was the great chamber, reached from a vice attached to a second porch beyond the screens. The kitchen is in the usual place, but surrounded by buildings of several stories, all full of lodgings. Other ranges of lodgings occupied the east and west sides of the court; but the former have disappeared, and of the latter only the outer wall and a lofty garderobe tower remain. A fragment of the chapel, which was semi-detached, as at Haddon, is left at the north-east angle. This fine house was built by Ralph Lord Cromwell, and Lord Treasurer, about 1450, and deserves to be better known than it is, especially since it is all of one date, and was planned by a master mason who must have been a notable craftsman.

Hurstmonceux.

Hurstmonceux Castle, in Sussex, is another great courtyard house, begun before Winfield Manor House, but not finished till long after. Unlike all the houses hitherto described, this was built wholly of beautiful brickwork. It consisted of three courts, within a quadrangular enclosure, set about with towers and surrounded by a moat. The entrance was through an elaborate gatehouse, reached by a drawbridge. The house is now a mere shell, all the buildings within it having been destroyed about 1800 to gratify the spite of a lady!

Icomb Place.

Icomb Place, Gloucestershire, is a good example of the application of the courtyard type to lesser houses; it is, moreover, as complete as Haddon Hall. The entrance is through a gatehouse of quite modest pretensions, leading into a small courtyard having the hall opposite the entrance. On the right is a parlour, with a bay window in the corner which masks a doorway into the gatehouse block. On the left are offices joining on to the rest of this block. The hall has a fine open roof, with two large windows on one side, and on the other a window and a chimney. The screens contain the usual doorways to the buttery and pantry, and form a passage to a second court beyond, surrounded by the kitchen, brewhouse, bakehouse, etc. All the ranges except the hall are two-storied, and there is no lack of proper accommodation for the master and his household. The gatehouse front has a fine open roof like that upon the hall. Icomb Place dates from the middle of the XVth century.

Oxburgh and Falkbourne Hall.

Oxburgh Hall, Norfolk, is another fine example of a late XVth-century courtyard house, built throughout of beautiful brickwork. The licence to crenellate is dated 1482. The house is still surrounded by a moat, but the hall range was pulled down about a century ago. The most striking part now is the stately gatehouse.

Falkbourne Hall, in Essex, began probably on the issue of the licence to crenellate it in 1439, was originally a small courtyard house, peculiar in having a large and prominent tower of good brickwork at one corner.

There are two other houses of this period of remarkable plan and construction that must be described, if only to show how completely the mediæval masons could surmount difficulties.

The tower that originally crested the Norman mount of Warkworth Castle, Northumberland, was replaced early in the XVth century, probably between 1435 and 1440, by a cruciform house of three stories, which, though a mere shell, is still practically complete throughout. The King's Commissioners in 1538 described it as "a marvellous proper dongeon of eight towres all joned in one howsse togethers," and a survey of 1567 says it "ys buyld as a foure square; and out of every square one towre . . . and in the same conteyned, as well a fare hall, kychinge, and all other houses of offices, verie fare and aptely placed, as also great chambre, chapell, and lodgings for the lord and his trayn. In the middle thereof is a peace voyd, which is called a lanterne, which both receyveth the water from diverse spowtes of lead, and hath his conveyance for the same, and also geveth light to certaine lodgings in some partes. And on the part of the same at the top ys raysed of a good hight above all the houses a turret, called the watch-house; upon the top whereof ys a great vyew to be had, and a fare prospect, as well towards the sea as all parties of the land."

Tattershall Castle.

The other house to which I desire to call your attention is the noble brick tower of Tattershall Castle, perhaps the finest of its kind in existence. It was built for the same Ralph Lord Cromwell who owned Winfield Manor House, and it is instructive to compare his Derbyshire mansion of stone, quarried from the hill on which it stands, with the great tower of brick in the Lincolnshire fens. The latter is oblong in plan, with an octagonal tower at each corner, and an internal area of about 50 ft. by 25 ft. Although floorless and roofless, it was, until a few months ago, structurally complete from top to bottom. It consists of a low basement, with four stories of chambers above and a low lantern-like top-story projecting between the towers as a gallery carried on a four-fold series of corbels. The height thus far is about 100 ft. The towers were carried up a stage higher and capped by conical spires. The ground story is entered by a doorway at the same level, and the other floors by a vice, or spiral staircase, in the south-west turret, with doorways opening into a wall gallery on each floor. The four principal stories formed each a separate room, with its own richly-carved chimneypiece, but there were also smaller chambers opening from them into the corner turrets. The tower thus contained four large rooms and at least sixteen small rooms, exclusive of garderobes, or the five divisions of the basement, wherein was also the well. The kitchen and offices were in a semi-detached building to the south-west, now destroyed, communicating with the tower by a doorway on the first floor. All the brickwork is of the highest excellence, but the doorways and windows are wrought in stone, as are the splendid chimneypieces which were so scandalously torn out and sold a few months ago.

So few of you probably have ever been to Tattershall Castle that you will no doubt be interested in seeing the chimneypieces in question. You may also wonder, with me, why the National Trust, which so easily raises enormous sums for buying headlands and fields such as abound on every side of us, thought 2,000*l.* too much to pay for one of the stateliest and most perfect brick towers in Christendom.

The fine brick tower, which, with the inner gatehouse, is practically all that is left of the once magnificent palace of the Bishops of Lincoln at Buckden, was obviously copied from the great Tattershall tower by Bishop Russell (1480-94), who, no doubt, had often seen it and admired it. This gatehouse is remarkable for having the Bishop's arms over the arch worked also in brick with coloured glazes, and the roses carved in stone.

Both Warkworth and Tattershall, with but little alteration, could be made into what would be deemed comfortable residences, even under modern conditions, and the same may be said of the majority of XVth-century houses. In proof of this one may point to the number that have been continuously lived in since they were built.

Carpentry Work.

The wooden halls and houses of early Norman times for which we have historical evidence have long since perished, as have the lesser dwellings of the same period. The tradition of them, nevertheless, continued after the introduction of stone buildings in the wooden pillars that formed the divisions, and if those once at Waverley and Kirkstall, and Westminster and Wells, have gone, a Norman fragment remains at Farnham and the whole construction in the Norman hall of Leicester Castle. Even so late as the XVth century there were set up the wooden pillars still to be seen in the Guildhall at York. On the manor of the Moor, near Uxbridge, formerly belonging to the Knights Templar, is a complete wooden hall, *circa* 1230, now converted into poor tenements, and at Tiptofts, in Essex, are some interesting remains of a pillared hall, likewise wholly of carpentry work, of the end of the XIIIth century.

Of the continued use of carpentry work in the XIVth century, in districts where stone could not easily be had, some useful examples exist. At Solihull, in Warwickshire, is a complete wooden house, *circa* 1330, with a hall and porch, and a transverse kitchen wing with solar, etc., over, reached by a stair within the porch. At Baggiley, in Cheshire, is a fine hall of carpentry work, *circa* 1330-40, and another good early example at Malvern was destroyed so lately as 1838. In Windsor Castle there are still considerable remains of a long and narrow cloister, set about with ranges of two-storied lodgings, all of carpentry work, built in 1351-2 for the thirteen canons of the Order of the Garter and their vicars. At Nursted, in Kent, there was till lately another instance of a stone hall, *circa* 1330, with a good open roof carried by wooden pillars. The general absence of early kitchens and offices belonging to stone halls that have survived suggests that they were usually only of half-timbered construction.

In Lancashire and Cheshire, and in Shropshire, Herefordshire, and Worcestershire, as also in Suffolk and Essex, and to some degree in Sussex and Kent, and in other districts where stone was scarce and timber easily obtainable, houses built wholly of carpentry abound. They range from those of the largest size to the humblest cottage, and extend in date throughout the XVth, XVIth, and XVIIth centuries. Those in the West Country, as at Bramhall, often have the intervals between the main timbers filled in with quatrefoils or other ornamental forms, or with a number of curved braces. In the eastern and south-eastern counties the construction is much simpler, but ornament is supplied by traceried barge-boards and carved and moulded beams, and by carved corner posts and spandrels.

The fine XVth-century manor house at Ockwells, Berks, is another good instance of half-timbered construction, and the style prevalent in Suffolk throughout the XVth and XVIth centuries is well exemplified by the guildhall at Lavenham, which has also a good carved corner post and oriel windows. The actual construction of these buildings can be seen in an interesting house at Boxford, also in Suffolk, which has lately been partly dismantled, preparatory, I fear, to its "restoration," a fate it does not deserve."

LEGAL COLUMN.

Compulsory Purchase.

Sect. 92 of the Lands Clauses Consolidation Act, 1845, provides that "no party shall at any time be required to sell or convey to the promoters of the undertaking a part only of any house or other building or manufactory if such party be willing and able to sell the whole thereof."

In the case Regent's Canal and Dock Company *v.* London County Council, the County Council, for an improvement scheme, served notices to treat on the plaintiffs for two pieces of "land and wall," which consisted of a narrow strip running parallel with the Regent's Canal and certain approaches to New North Road Bridge. The plaintiffs claimed 822,000*l.*, and unless this sum was agreed to they required the Council to take the whole of the canal and lands and works appurtenant thereto, which they valued at some 2,030,057*l.*, on the ground that the land which the Council sought to acquire formed part of a "building or manufactory" within the meaning of the above section. The Court held that the land sought to be acquired did not form part of a "building" within the section; but the learned Judge pointed out that there appeared to be no decided case on the meaning of the word "building" in this section.

Illegal Action by Societies: The Trade Disputes Act.

In the present crisis of the coal strike the Press are commenting on the peaceable attitude of the men and the absence of outrage. We are far from wishing in any way to belittle the conduct of the men, but the fact must be pointed out that this absence of outrage is really due to the strike being universal and there being no necessity for the exercise of "peaceful persuasion." Only two small mines continued working after the declaration of the strike, and at these two mines there were scenes of violence, the strikers, under pretence of "peaceful persuasion," intimidating the few men working, by hostile demonstrations in force. It would be a serious mistake to consider that the present strike in any way weakens the case made by nearly all classes of employers against the Trade Disputes Act. If the strike ceases to be universal, if some workers in mines desire to return to work and to dispose of their labour as they have a right to do, the demon of "peaceful persuasion" will at once be raised, the men will be intimidated, and the property of their employers will be damaged, and sect. 4 of the Trade Disputes Act will serve to protect the funds of any union which has incited the men to acts of violence from being attached to answer for the damage done.

In this connexion we may point out that the case for the repeal of the Trade Disputes Act has received support from an unlooked-for quarter. A political society, "in contemplation or furtherance" of its objects, has seen fit to "peacefully persuade" the citizens of the metropolis by indiscriminately breaking shop windows. The Government have recognised the seriousness of such a conspiracy, and universal approval has been given to the principle that the funds of the society should be made liable for the damage done. Public sympathy has at once been accorded to common sense and common law redress being applied to such criminal action. Surely the public may now also ask that common sense, common law, and common justice may again apply in the case of trade unions? No wonder that a large section of the community is asking why these trade societies should be so privileged.

LAW REPORT.

COURT OF APPEAL.

(Before the MASTER OF THE ROLLS and Lord Justices FLETCHER MOULTON and BUCKLEY.)

Painter's Claim against Builders and Decorators under Workmen's Compensation Act: Richards *v.* Sanders & Son.

THIS case was heard on Saturday, the 16th inst., upon the appeal of the respondent from the award of his Honour Judge Selfe, sitting at the Marylebone County Court, as the arbitrator under the provisions of the Workmen's Compensation Act.

Mr. Ellis Hill appeared for the appellants and Mr. Jacobs for the applicant, the workman.

Mr. Ellis Hill said his clients appealed from the award of the County Court Judge upon two grounds—first that there was no evidence before the learned Judge entitling him to hold that the applicant was incapacitated by the accident; and, secondly, appellants asked for what was practically a new trial upon the ground that the learned County Court Judge admitted certain statements in certificates as evidence which were not evidence and which induced the learned Judge to believe that a *bonâ-fide* accident had happened to the applicant, and that the man was really suffering from the effects of the alleged accident.

The facts of the case were these:—William Richards, the applicant, alleged that on May 8, 1911, he was working for the respondents, a firm of builders and decorators, in a kitchen of a house in Bryanston-square. Richards was a painter, and on the day in question he was working with another man in the kitchen of the house. Richards' story was that the work being high up a painter's tressle was put near the wall, that a board was put through the tressle, and that the other man with whom he was working got up the tressle and on to one end of the board that projected, and that he was instructed by the foreman to hang on to one end of the board as a counter-weight and while hanging on in that way he (applicant) strained his heart and was taken very ill. Richards was undoubtedly taken very ill at the time, but his own story was contradicted by nearly everybody at the hearing. He made no complaint until after he had been to St. Mary's Hospital. If it was a *bonâ-fide* case the evidence from the hospital was of primary importance as to how Richards was treated. He (Counsel) could not help feeling that the applicant's advisers must have thought that the evidence from the hospital would have put an end to the applicant's case, because they subpœnaed Dr. Wilcox, one of the physicians at the hospital—a gentleman in a very high

LAW REPORT—*continued on page 346.*

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

MARCH 25.—**Colchester.**—SCHOOL.—Limited to architects practising in the borough.

MARCH 30.—**Edinburgh.**—MEMORIAL TO KING EDWARD.—Limited. See Competition News, p. 151, February 9.

MARCH 31.—**Manitoba, Canada.**—PARLIAMENT BUILDINGS.—The Government of Manitoba invite designs for the new Parliament buildings to be erected in the City of Winnipeg. See advertisement in issue of February 9 for further particulars

APRIL 13. — **Ormskirk.** — CLUB-HOUSE.—Competitive plans are invited for proposed clubhouse for Ormskirk Golf Club. See advertisement in issue of March 1 for further particulars.

APRIL 20.—**Birmingham.**—BLUE COAT SCHOOL.—Limited to local architects. Assessors, Mr. J. H. Hunt, F.R.I.B.A., and Mr. C. E. Bateman, F.R.I.B.A. Particulars from the Secretary, the Blue Coat School, Birmingham.

LAW REPORT—*continued from page 344.*

position in the medical profession—who would not be likely to and could not be expected to attend upon a 1*l.* 1s. subpœna. Dr. Wilcox did not attend, and then, on behalf of the applicant, the certificates were tendered as evidence, and although he (Counsel) objected, the learned County Court Judge admitted them as evidence. There was no reason why the house-surgeon who acted at the hospital under Dr. Wilcox could not have been called as a witness. If their Lordships ordered a new trial he (Counsel) would undertake to call Dr. Wilcox as a witness. The County Court Judge held upon the evidence that Richards was incapacitated by an accident arising in the course of his employment, and made an award in his favour for 17s. 6d. a week compensation during incapacity. He submitted that in the circumstances the case ought to be remitted to the County Court and be retried.

Mr. Jacobs, for the applicant, said he could not contend that the certificates were properly admitted as evidence by the County Court Judge. He submitted, however, that there was ample evidence to justify the finding of the County Court Judge. It was due to the solicitors instructing him to say that they had done all they could to get Dr. Wilcox to give evidence; but the latter was prevented from doing so on account of being compelled to attend an inquiry at the Home Office.

In the result their Lordships held that in the circumstances the case must be referred back to be reheard by the learned County Court Judge.

Order accordingly.

PATENTS.

APPLICATIONS PUBLISHED.*

3,937 of 1911.—Frederick William Campbell: Removable cores for forming hollow piles, columns, and the like, and for forming holes in concrete structures generally.

4,421 of 1911.—Frederick George Jones: Conveyor rollers.

4,906 of 1911.—John Hugh McCoy: Concrete water tanks.

5,000 of 1911.—Alfred Charles Blackmore: Mechanism for connecting doors so that the opening of one simultaneously effects the opening of the other.

5,402 of 1911.—Herbert Abraham and Harold Woodbury Haines: Waterproof cement, mortar, and miscible pastes for making the same, and processes of making such pastes and making waterproof cement, mortar, and concrete.

7,016 of 1911.—Fred Watson: Back boilers for use in connexion with domestic fireplaces.

7,047 of 1911.—Frederick Marshall: Fire-escapes.

7,929 of 1911.—James Henry Birtwistle: Grates and fuel holders.

8,186 of 1911.—Frank Wilford Mellows and William Arthur Price: Mode of and means for use in glazing windows and the like.

8,689 of 1911.—John Alexander Parker and John Wright: Chimney and ventilating shaft tops.

9,310 of 1911.—Herbert Linwood Sleigh: An attachment for use in connexion with motor-car and other doors, and folding windows, to prevent rattling and slamming.

9,350 of 1911.—Alfred Acroyd, Percy Churchfield Larmuth, and John Reynolds: Ventilators and the like.

9,382 of 1911.—James Henry Bennett and George Richard Leadsom: Apparatus for operating casements, fanlights, and the like.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than 6 p.m. on Wednesday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

*Denotes *accepted.* †Denotes *provisionally accepted.*

Mr. Arnold Mitchell, F.R.I.B.A., Architect.

A LESSON FROM AMERICA.

THE contemporary architecture of America is a manifestation of the modern spirit of progress in a newer and less restricted country to which we who live and work amidst more firmly-established traditions might more often direct our attention.

The recent discussion at the Architectural Association showing so much appreciation, and, we think, discriminating appreciation, of the great progress recently achieved on the American Continent is a hopeful sign that we are beginning to realise the necessity of bestirring ourselves.

As Mr. C. C. Brewer points out, a country progressing at the speed of America needs competent and vigorous architects, and forces them to the single purpose of erecting the best possible building in the shortest possible time, and that the architects are rising with almost incredible success not only to meet the practical and commercial needs of the community, but to work out artistic problems with a certainty, a dignity, and a breadth the equal of which it would be hard to find in any other period.

This is probably no exaggeration. Nothing is more interesting and instructive than the way the architects have organised themselves and their methods to cope with the situation. These methods might not suit this country; they may even appear to us to be quite inadequate for the production of those special qualities of design to which we attach so much importance, but there is no doubt they are exactly suited to the special circumstances of the case, and have resulted in what might justly be described as the architecture of efficiency.

Whatever limitations this architecture may have from our point of view, or by comparison with the great periods of the past, it would probably be safe to say that in no other country at the present day does architecture more readily respond to the demands of the moment.

The demands of a comparatively new and rapidly growing community are different, and in some respects may be less exacting than those of an older and more settled civilisation. In the rush of material progress something of value may have to be left behind, subtleties may possibly be overlooked, but the essentials necessary to that progress are demanded, and American architecture never fails to supply them.

It seems to us that so long as the architects of America continue to answer to these demands, to attack every new problem as it arises in the same fearless spirit of practical efficiency, and to keep pace with the progress of the country, there is no fear for the future or for the evolution of a characteristic style. When America finally arrives her architecture will arrive with her.

There are those who consider that a definite style is as much a matter of temperament, of mental standpoint, or of method as of features and details, and expect that the immediate future is more likely to produce a cosmopolitan style with slight national or racial variations, than such differences of form as we have seen in the past. Such may be inclined to think that the first indication of characteristics distinctly and typically American has already made its appearance.

There may be those also who will hold that the very limitations of the conditions under which American architecture has been compelled to develop have not been altogether detrimental to its progress. To the student of every form of art the time study is of inestimable value. Whether in drawing a figure or designing a building, the time limit teaches the necessity of going straight to the heart of the problem, of grasping and expressing its essentials to the exclusion of its non-essentials. A generation or two of practice in such studies, with a short time limit and so exacting an instructor as practical necessity, is no bad preparation for the more leisured maturity which the future seems to promise to American architecture.

Although the time limit is not altogether unknown here, particularly in relation to our commercial work, it would be impossible to say that English architects have so thoroughly learnt the lessons it is capable of teaching, or that the work produced under its influence is comparable in the broad handling of the essentials of a problem to that produced in America.

Making all allowances for the native genius of the American architects, there is no reasonable doubt that their success in rising to the occasion and in turning the disadvantages of their environment to the ultimate advantage of their art is due to their superior education and to the system of training based upon that of the École des Beaux-Arts. Unless we are to own ourselves inferior to the Americans in natural ability, it is only reasonable to suppose that our comparative failure in this respect is due to our lack of a similar training. The pressure of a time limit does no doubt demonstrate the necessity of being able to immediately grasp the essentials of a problem and present them lucidly and forcibly, but only a sound theoretical and technical training such as this will enable us to do it. It is here that we are so lamentably deficient and altogether behind the times.

Nowhere is this deficiency more apparent than in our competitions, yet nowhere is this special facility more in demand.

Here we have a system which, if rightly conducted, is admirably adapted to enable the young architect to obtain that continuous practice in the instantaneous grasp and broad presentation of essentials which is so necessary to ultimate success, yet from lack of proper training in a right method of procedure he is unable to take advantage of it. The result is that the average competition design is chiefly remarkable for the painstaking but useless elaboration of irrelevant and non-essential details.

In no class of work perhaps would the benefits of a Beaux-Arts system of training be more promptly and profitably realised.

It is not a question of "Orders" or of forms and features, it is a question of the whole mental outlook towards architecture, of the right attitude of mind or the right direction from which to approach a problem; a question of principles and of the continual practice of a right method of applying them to every known type of building.

It is here that the English architect is so hopelessly outclassed in international competitions. Pitted against opponents with specially-trained minds, and the general arrangements and main characteristics of every type of building at their finger-ends, English architects under the same time limit have no chance whatever to do justice to their undoubted good qualities.

But, although national vanity may find some consolation in the reflection that for all this we still lead in domestic architecture, it will soon be necessary to ask ourselves how long this consolation will be ours. Domestic sentiment and the love of home are characteristics of every branch of the Anglo-Saxon race. In that branch which is most highly trained will this sentiment find its most complete expression in the future.

KING EDWARD MEMORIAL.

WHEN the site in the Green Park now apparently finally adopted for the King Edward Memorial was first selected we ventured to point out that the Committee were by no means at the end of their troubles, as the site presented inherent difficulties and would create problems not easy to solve.

The report of the recent meeting of the Committee at the Mansion House and the publication of the sketch designs for the Memorial prove that our fears were only too well founded. The difficulty with the vista and with the unfortunate fact that a statue cannot face both ways at once have proved so far insuperable. In answer to Sir Squire Bancroft's objection to King Edward's back being turned on Piccadilly, Sir Vezey Strong could only endeavour to console him by suggesting that, though the monument did turn its back on Piccadilly, that back would be a very attractive one. Should anyone ever be so rude as to turn his back on our late Lord Mayor, we trust it will be an equally attractive one, and that Sir Vezey Strong will find in its attractiveness sufficient justification for the lack of courtesy.

We have already expressed our opinion that the right way to obtain the best design would have been by open competition, and our fear that "unless such a course is adopted it can only be a lucky fluke if the memorial escapes being counted as another of our too numerous failures in this direction." So far as we are able to judge from the sketch designs, our forebodings were not without a certain measure of justification.

But, although it must be admitted that this sketch design is far from successful, and that it hardly represents the best that contemporary talent could produce, it must not be forgotten that it is not the first choice of either the architect or the sculptor, and that no artist is at his best when he has been put off his stroke or has been persuaded to work on lines with which he may not be altogether in sympathy. We understand that a more comprehensive and distinctly architectural scheme was originally submitted, which unfortunately failed to meet with the approval of the Committee.

This, in the circumstances, appears to be particularly unfortunate. If the Committee were influenced in their decision to select artists in whom they had confidence by the hope that they would be able to leave the matter entirely in the hands of these artists, and so save themselves much trouble and anxiety, this hope appears to have been frustrated, and any advantage which the method of selection may be supposed to possess in this respect over that of open competition does not appear to have been realised.

We notice that Mr. Christopher Head suggests that, as the park at Shadwell is the only scheme upon which they were all agreed, they should spend 10,000*l*., instead of 20,000*l*., on a statue only in the West-end, and devote the rest of the money to Shadwell. This is one way of dealing with the problem that has something to commend it. If the site cannot be properly treated, the less that is done the better; and if only a statue is required, it might be more easy to find a suitable site.

In a city like London that has grown up haphazard, however, sites are made, not found. It is perhaps one of the reasons of the present difficulty that the Committee has all along been expecting to find one ready-made, and has not realised that if a satisfactory result is to be obtained a good deal of money must be spent in the formation and preparation of a site. But as Sir Vezey Strong has stated that this site is irrevocably fixed, it is useless to discuss the question further.

The only thing left now is to try and make the best of a bad job. If it is definitely determined to place a monument of this description so that it spoils the vista from Piccadilly to the Queen Victoria Memorial, and turns its back on Piccadilly, it might perhaps be well to

rry the idea to its logical conclusion
r ignoring Piccadilly altogether. We
lieve the suggestion has already been
ade that the monument might close
e vista from Buckingham Palace and
backed up by trees screening it
tirely from Piccadilly, and we think the
ea might be borne in mind.

We do not know whether the fact that
e Committee has to divide its funds
tween the Green Park and Shadwell
d any influence on the rejection of the
tists' original and more expensive
heme. We long ago expressed our
rs that with energies divided between
o schemes justice would be done to
ither, and we seem to see in the ap-
oved design just another example of
at spirit of compromise which is sup-
sed to have such happy results in
blic affairs, but which in art is generally
disastrous.

The result is a monument which is
ither one thing nor the other. Neither
le fine architectural lay-out proposed by
e artist, nor the single statue suggested
Mr. Head; neither the great
vereign of a mighty empire, nor the
mple, kindly friend of the least among
s people.

NOTES.

The Newest Responsibility of Architects.

We have heard a good deal lately about the newer responsibilities of the architect, but, how-
er indefinite they may be, we hardly
nk they can include the architect's
bility to be held up to scorn by
turesque writers in the daily Press
r sins he has not committed. We
ite sympathise with the feelings which
idently prompted Mr. Philip Gibbs to
ite so forcibly in the *Daily Chronicle*
the housing accommodation provided
r the ironworkers of Dowlais. His in-
gnation does him credit, but let him be
st in his wrath. Dowlais, we fear, is
t a pleasant place. "As I climbed up
e steep road," says Mr. Gibbs, "I
mped up a crescendo of awful squalor,
ding in hideous triumph. The devil
uld not have built Dowlais with more
blime effects of ugliness." After this
e are not surprised to hear that "In
owlais it is difficult to be decent, and
me of the people have given up trying.
or here, in narrow streets and alleys,
raggling up the hillside, are rows of
ualid hovels, of two, three, and four
ooms, built eighty years ago, in many
ses, and never repaired since then.
ne stones are loose in their walls. The
ndow-frames have warped. Tiles have
llen from the roofs. Their gutters are
isted. Their front doors hang loosely
their hinges. They were built before
nitation was a word in the spelling-
ook of life. The architect did not
orry about drains. Whoever he was,
his utter callousness to human needs
did not worry about anything better
an a sty in which to herd the slaves of
dustry." Whoever he was, we feel
re he was not an architect in any sense
the word; but whoever he might have
en, the callousness was his employer's,
d he certainly is not responsible for the
esent state of these pigsties after
ghty years of neglect. "Through the
ll-mouths of those blast furnaces,"
says Mr. Gibbs in the final climax to a crescendo of awful indignation, "would I toss the men who built these human pigsties!" If justice demands that anyone be tossed into a blast furnace, we suggest the person who is making a profit out of their present condition, or those who are responsible for the fact given by Mr. Gibbs, though we are not responsible for his statements, that whereas whole rows of them have been condemned by the local authorities as unfit for human habitation, yet "most of those condemned houses are still inhabited, and the tenants take in lodgers." This should interest someone at the Local Government Board.

Old Buildings and Street Widening.

From various parts of the country come appeals from lovers of the fast dwindling old-world buildings against street-widening schemes which, devised chiefly in the interests of the motorists, threaten to abolish all that is characteristic in our country towns, and to reduce everything to the commonplace. Certain of the inhabitants of Lyme Regis are strenuously opposing a scheme for widening the foot of the main street, which will sweep away a well-known old-world building known as the Fossil Shop, situated on a still more ancient bridge, and which will destroy the character of this part of the very picturesque town. The majority of the Borough Council favour this scheme, no doubt only regarding the narrowness of the thoroughfare, but a considerable number of ratepayers are opposed to it, and probably outside public opinion might be invoked in their favour. Nowadays it is not sufficient to advocate the retention of the beautiful on æsthetic grounds alone; the practical side has also to be regarded; but in this instance there are also some practical reasons against the scheme. The piece of the road it is proposed to widen resembles the neck of an ordinary wine-bottle; the road is wider where the body of the bottle would be, and within a few yards there is a very dangerous right-angled corner. At present the narrowness of this short piece of the street compels motor traffic to slow down and approach the corner carefully but if this short neck of the bottle be widened motor-cars can approach the corner rapidly, and a thoroughfare which so far has been the scene of no serious street accident will be rendered more dangerous. Thus for once the æsthetic and the practical seem to combine. If town authorities would only realise in time that in modernising their towns in ways which have no direct bearing on sanitation or health they are destroying one of their most valuable assets we should hear less of acts of vandalism throughout the country.

Up-to-Date Bruges.

Lovers of the old-time charms of Bruges will be distressed to learn that electric trams on the trolley system are being arranged for, possibly on the track of the noisy steam one, or "light railway," between the station and the docks and canal—at least, as a beginning. Should it pay its way, no doubt "widenings" will take place to enable cars to run down the Rues Longue, Ste Cathérine, and Aux Laines, and along the Rue des Pierres, and across the Grand Place, and possibly along the charming old Dijver. One thing in its favour may be mentioned, and that is that many will be glad of a lift over the cobbles. Another less unwelcome item of Bruges news just to hand is that restorations are in progress at the Grunthuys, and a public garden being laid out round it, enabling a splendid view to be obtained of the apse of Notre Dame Church, old houses overlooking the canal, and so forth, which was impossible before. We know those "public gardens"!

The Building and Cost of Manchester Schools.

We gather from a letter by Mr. Geo. H. Willoughby in the local Press that the schools erected for the Manchester Education Committee are not designed by an architect, but are carried out by the Director of Education with the assistance of draughtsmen and a clerk of works, with the natural result that they are below the standard in design and construction, and cost more than similar buildings in the neighbourhood. We must confess that it sounds well-nigh incredible that in a great commercial centre like Manchester such unbusiness-like and inefficient ideas and methods should be tolerated. As Mr. Willoughby pertinently remarks, the University and the Municipal School of Technology both encourage the study of architecture. The Corporation makes itself to some extent responsible for the production and the training of the architect, and yet when produced and trained it denies him the opportunity to work in connexion with its own school buildings. The hardship to the profession is obvious; but Mr. Willoughby, rightly enough, we think, does not unduly press this point. While looking forward to the day when the advantages of a high standard of architectural excellence will be the strongest argument with the public, we have no doubt that in the meanwhile Mr. Willoughby is well advised to concentrate on the question of cost. This argument, at all events, should appeal to Manchester.

Forest Fire Prevention.

On previous occasions we have alluded to the appalling waste caused by forest fires in America, Australia, and New Zealand. Incalculable damage has been and is still being done by the thoughtless actions of settlers, campers, and others. In Montana and Northern Idaho alone the losses from fire in a single year have reached the total of 6,000 million feet board measure, with the estimated value of 4,000,000*l*. The Forest Service of the United States are doing their utmost to prevent devastating fires, and it is satisfactory to learn that considerable success has attended the inauguration of preventive measures. Among the modern aids now being employed for the purpose the telephone has been found most valuable, enabling observers on watch-towers to communicate almost instantly to other members of the service the position of any outbreak within a circle of some 30 miles radius, and so to ensure the prompt concentration of men and material for extinguishing the fire in its early stages. The work to which we allude is of direct interest to architects and builders, who

have good reason for desiring the conservation and intelligent management of the world's timber resources.

Ancient Villages in Lake Gatun.

In autumn next the filling of Lake Gatun for the Panama Canal will submerge several early villages which, although not possessing the same interest as Egyptian ruins which suffered by the construction of the Assouan Dam, are, nevertheless, directly associated with the history of America since the discovery of the Continent. Some of the villages are mentioned in Esquemeling's account of his adventures under Morgan, and through them passed the main route to Peru in the time of the Spaniards. In later days they formed the home of gold diggers, and subsequently were occupied by those engaged on the canal works inaugurated by De Lesseps.

ART EXHIBITIONS.

Of recent art exhibitions there is none more interesting than the display of old glass panels at the Fine Art Society's Galleries. There are altogether 149 pieces of stained and painted glass, which are effectively shown in small groups of panels at a time, so that the light shines through the glass pretty much as it would *in situ* if it were not for a greater sharpness of contrast of dark background. The vast majority of the panels go back to early mediæval, mediæval, and Renaissance times, and the collection as a whole comprises examples of English, Flemish, Swiss, German, and Dutch craftsmanship. If the specimens are observed in chronological order the consideration is almost inevitably forced upon one that the earlier periods of the art were its finest; the quality of the glass possessed a deeper brilliancy, the tones were richer and blended into finer harmonies. It is curious to note that one of the most interesting specimens is one of the earliest—a grisaille taken from Salisbury, an almost perfect example of the art with a pattern evolving out of a geometrical design. We have later designs dealing with religious subjects, also of great interest. And then, as we proceed, the artists seem to strive after the expression of merely anecdotal ideas which have been expressed equally well, or better, in the arts of painting and carving of the same period. Examples such as these, apart from the virtuoso's and collector's point of view, and from the point of view of technical accomplishment, have not the same artistic importance as the earlier pieces. In view of the modern use of stained glass in domestic work the exhibition should not be missed.

At the same Society's galleries there are still a few of Mr. Walcot's pictures remaining on view, which make us regret that we did not see the whole of his recent exhibition. From those which are left—water-colour drawings of the Palais de Justice at Brussels, the old Ashmolean at Oxford, and a view of Messrs. Lanchester & Rickards' new building at Westminster, among other subjects—we were, however, able to discover a talent that apprehends the importance of the essential qualities of architecture and architectural detail in pictorial composition. We understand that Mr. Walcot also exhibited some reconstructions of classical work, which adds to our regret at not having seen the larger collection. Mr. A. Wallace Rimington, whose pictures now occupy the same gallery, is not indifferent to subjects connected with building; he is more definitely absorbed in the traditional view of the picturesque than Mr. Walcot, but this does not lead him to preclude subjects of definite architectural interest. In his more ambitious architectural studies, when he gets away from the quaint bits, we detect the influences of the school of Prout without, however, the precise knowledge which Prout possessed, for his time, of architectural proportion and form. Mr. Rimington's water-colours suggest something of the labour of the processes of the material in which he works; but if he is a little too conscientious in this respect, his sympathies are broad, and he obviously takes a sincere delight in various aspects of nature and portrays them with a certain lyrical appreciation.

So far as architecture is concerned, "The Pencil Society" (at Mr. Paterson's Gallery) has little to tell us. We do not quite know why it is called a society in any case. Millet and many other artists have shown us the possibilities of pencil-drawing. There is plenty of good work here, but it is not very serious. The drawing by Mr. Spurrier of St. Paul's Cathedral is free and correct; the compositions of Mr. Frank Gillett are interesting; Mr. Joseph Simpson is under the influence of certain phases which find expression in the Quartier Latin; Mr. Ross Burnett's attempts to discover an emotion in old cowsheds and old barns, not quite successfully; Mr. Cecil King catches the spirit of Paris in an English manner in two topographical drawings; Mr. Fergusson, in another type of subject, also suggests Paris in three drawings of considerable breadth and power. Mr. Hedley Fitton's "London Bridge" and "Site of the County Council Hall" are characteristic of his admirable work. The drawings of Mr. George Belcher, Mr. H. M. Brock, Sir Charles Holroyd, and others have all points of interest, but they are outside the purpose of the present commentary.

Mr. Gerald C. Horsley presided on Monday at Tufton-street over a combined ordinary general meeting of the Architectural Association and of the Camera, Sketch, and Debate Club.

Mr. Hall, Hon. Secretary, announced that the sixth spring visit will take place on March 30, to the new Wesleyan Church House, Westminster. Members to meet at the building at 2 p.m. He further announced that the annual Smoking Concert and Revel of the A.A. Athletic Club will be held on March 26 at the Pillar Hall, Victoria Station Restaurant. Tickets, price 2s. 6d., may be obtained in the office or from Mr. C. G. Boutcher, 40, Great James-street, W.C.

Scrutineers were appointed in connexion with the election of officers for 1912-13.

The President proposed the following votes of thanks: The R.I.B.A. for the following—Annual grant of 100*l.* towards the educational work of the Association; grant of 25*l.* towards the publication in the Sketch Book of some of the R.I.B.A. prize drawings, and 21*l.* subscription to the Royal Architectural Museum; to Miss Lynam for her kindness in presenting a number of books from the library of the late Mr. T. M. Rickman; to Mr. W. A. Pite for his kindness in providing tea upon the occasion of the fifth spring visit, to King's College Hospital, on March 16, and for conducting the party over the building; and to Mr. G. A. Audsley for presenting three numbers of Allen's Technic and Art Manuals to the Association library.

Mr. C. A. Voysey then read the followin paper on

PATRIOTISM IN ARCHITECTURE.

"If we make no effort to discover t foundations of our taste, we shall be easi borne away on the flood tide of fashio And association appealing more to the hea than the head will override reason a leave sensuous emotion to carry us to t bottomless pit of Post-Impressionism. It only a matter of degree how narrow or based our taste may become if we lose th balance of the senses—that is, the proportio ate use of reason and emotion, whether it on the side of emotionalism or intellectuali of spirituality or materialism.

The human pendulum is for ever slow swinging from one extreme to another, a we are for ever struggling to arrive at happy mean.

The present age shows a strong emotion tendency to swing towards the development our imitative faculty, leading to conformity a collectivism, and away from the individua creative, and idealistic manner.

In this collectivist attitude we see a va amount of deadly conventionalism, which a form of tyranny oppressing the young an old alike. It is too easily assumed that th majority are like sheep to be penned in a controlled, and that it is not safe to lea them free in any direction.

In matters of art conscience is no longer t be our guide, but some Cabinet Ministe with his satellites of self-satisfied adviser In short, a Minister of Fine Arts is to be s up to impose the Order of the Parthenon.

A desperate endeavour is now being ma to dominate men's conduct and to crea what its advocates call a "national style, by imposing a definite Order of architectu on the young, and likewise upon the unfort nate competitor for public buildings.

Foreign Architecture and English Students.

Our educational system is based on th assumption that some foreign architecture a fit study for an English student. And h is given every encouragement to travel foreign lands, and by such means to ga fluency in the language of architectural form without the laborious study of the nationa character and conditions that have given the birth. These are the gentlemen that writ books to prove from whence certain characte istic forms are derived, absorbing attentio in superficial likeness and missing the deepe points of difference, which, when examine in conjunction with climate and characte will be found to constitute the only vita and enduring qualities worthy of our study It cannot be denied that it is far more im portant to know from what general principle good work is produced than to have a know ledge only fitted to reproduce given examples How certain forms and methods have bee introduced by the importation of foreig workmen is important enough, but wha should concern us much more, is how far an importations are fitting and desirable, sincer and true.

Now we must observe that in all the fines examples of architecture throughout th world we find that the qualities we admir are due to the faithful use of local material and conditions, the sincere expression o national character and aspirations; both o which qualities are strongly influenced b climatic and also geological and geographica local character.

The climate of a country affects the ligh and the light affects our enjoyment of tex tures and colours quite as much as of ligh and shade. Who has not felt the unsui ability of highly polished marbles, mosai and highly-glazed surfaces in England, an their absolute fitness under Eastern skies Do we not readily associate bright surface and colours with strong sunshine, and ric sombre colouring with our cloudy skies?

The effect of climate on the character of people has been proved by many scientif writers, and needs no repeating here. It enough to observe the characteristics of loc material as evidenced in our own country Even different counties and districts will sho a marked difference in character. Compar

instance, the colour and texture of the erials in Westmorland with those in t. Let us mark well this characteristic he finest architecture—viz., that it grew nly out of national conditions and national racter, and was never a foreign importa- And a national style can grow up in other way. We must recognise our con- ions, material and intellectual, if we would the Divine law of fitness.

re we working now on this principle? we not setting up a model drawn from ign lands, and endeavouring to squeeze requirements into it? Only recently in lic an architect was holding up to the iration of his audience photographs of erican railway-stations designed (as he) as closely as possible on the lel of ancient Roman Baths. Should therefore, design Roman Baths on model of American railway-stations? at wonder if ignorant people buy old ns and convert them into houses, getting that if they are good barns they st be bad houses, and if good houses very barns! As if good architecture were not direct product of the purpose of the lding. The general custom is to set the rt on a symmetrical façade and then eeze our plan into it, making dark passages lobbies, rather than upset our symmetry. we not often use draughty, rattling wood hes instead of stone windows and iron ements, in order to produce a Renaissance racter in our building? Do we not give same size window to a closet that we give our banqueting hall if it happens to come our main front? How often do we see ny little villas aping the manners of a al palace, porticoes and empty niches, nices and broken pediments provided for villa rented at 70*l.* or 80*l.* per annum! owing clearly that the outside comes first our calculations and the plan afterwards, d that we are wedded to a form that is born of the parent of practical require- nts, but the foster-child of a foreign-bred icy. The structure is designed from with- inwards, not, as it should be, from within wards. I will not plead for either Gothic Classic, but only that conditions and uirements shall dominate inside and out, d, above all, that the expression of thought d feeling shall be national and sincere. do not want Chinese national character pressed in Piccadilly any more than ecian or Italian character. We do not nt the poor man's villa to ape the stately me of the wealthy.

The more we go to Rome the less we shall ow of London. The freshness and charm foreign lands has belittled our reverence our own country. And we are apt to get that our Maker has given us a climate d country different from all other nations. e cannot ignore this fact without loss of triotism and national dignity.

English Thought and Feeling.

Fitness is a Divine law, and the more we vestigate Nature the more we become im- essed by its fitness: therefore we do wisely work on the same lines and strive dili ntly after fitness. Can it, then, be fit to use reign styles to express English thought and eling? The English architect down to the d of the Tudor period was content to learn d understand all the conditions of his own ntry, to understand the character of his n countrymen and to express their emotions d aspirations. He was keen to learn the ssibilities and limitations of his material, d, in order that we may benefit by his periences in this direction, we should study the pure English examples we come across, ver forgetting that it is only unalterable chnical qualities which we most need to arn, and not those accidents of passing shion, or the changing manners and stoms of different periods. It is very portant that we should notice, for stance, the way the stone in different dis- icts was used, rather than the existence battlements or moats, which tell not of e history of building so much as of the anner of life of the people.

In our admiration for ancient examples e are apt to imitate the forms of obsolete atures and miss the practical and essential uths concerning the fitting use of material. e are fascinated by the marbles and osaics of foreign countries, and fail to perceive how they expressed the quality of mind of the nation; the quality of light in their native land, no less than the geographical and geological conditions out of which they have grown. This disregard of national character and national needs and conditions is the foundation of nearly all our unpatriotic conduct and sentiment.

How few of the rising generation know to what extent the old Gothic builders in England revelled in colour and rejoiced in rich displays of harmony and human emotion! Those were the men who had never travelled abroad—never journeyed to foreign lands with any adulterous intention or made love to foreign examples of their craft, but created noble buildings out of the bounty of their own land and the brotherhood of their own national character, and their own history, hopes, and aspirations, exactly as the Greeks and Romans, Italians, Japanese, Chinese, and all the nations that ever produced a national art have done.

But, alas, the later Englishman has been unfaithful; he has turned his back on his own climate, and hardly speaks of it except to abuse it! And he has opened his arms to all the foreign material he can lay his hands on. And he raves about the most un-English architecture he has got, regarding it as so magnificent that all practical considerations must be waived for the purpose of providing an æsthetic approach to it.

Men are quicker to discern likeness than difference, and any trivial likeness between one object and another in our memory is carefully treasured, especially if that memory gives us pleasure. We are content with trivial pleasurable sensations without troubling to look for more sterling qualities of fitness.

The fact that our St. Paul's is well proportioned and gives us a pleasing sense of light and shade, and is big, justifies its existence in many people's eyes. But that it is a clever man's copy of a foreigner's expression of his own national character—albeit a foreigner's wise and clever use of his own conditions and requirements—never seems to be considered as in any way a proof that St. Paul's is an exotic and not a national growth. It is not the product of our climate or the outcome of our national life. It is a theatrical falsehood of the most prolific period of profligacy. The few wealthy who could afford to travel were intoxicated by what they saw, and they quickly lost their hearts to foreign beauties. And the universal law that we strive to reproduce what we love and admire led them to tear down their English houses and erect Italian, Renaissance, French, and other foreign examples in imitation of what they had seen and in boastful proclamation of their foreign experiences. We are only now gradually awakening to the consciousness that the ravishing beauties of foreign architecture are always due to their being true and noble expressions of national character, governed by reverent regard for local conditions and materials.

Nature's Material Qualities.

As a general principle we may reasonably assert that Nature's material qualities are more beautiful than anything that man can produce, though man may add to and enrich the beauty of Nature by the addition of his own beautiful thought and feeling. The recognition of this will vastly strengthen our patriotic feeling, and, while encouraging a true appreciation of our own country, it will likewise help us to appreciate other countries more rationally.

It is of very great importance that we should get at the truth of this matter, because our present method of education and the practice of our profession is steadily leading to an artificial mode of expression independent of the practical necessities of life. Our town halls, banks, public and private houses are all stereotyped bastard children of foreign parentage. And there is an effort being made to coerce the shopkeepers into the same mould. No matter what their trade may be, they must manage their business as best they may behind the Renaissance shirt-front. As if true architecture were the expression of a cultured traveller, rather than a stay-at-home craftsman's endeavour to use local material fitly, to minister to individual needs and requirements.

Town Planning.

The town-planner is a collectivist; his idea is to drill humanity into line and regulate his outward movements regardless of his inward needs. He, too, regards the general aspect and ignores individual necessities. He must have building lines and symmetry, regardless of individual tastes and requirements. He would have our tastes and requirements regulated by Act of Parliament—the deadliest machine ever invented when used to coerce taste. Acts of Parliament we need to protect the weak against the strong—to guard an Englishman's true expression of his love for his own country, not to force him to adopt the language and manners of a foreigner.

The vista may be a fine model to emulate and a suitable place for strutting human peacocks and peahens, but for a strenuous practical Northern people it is not a fit and true expression of their needs to be introduced into every speculative suburb. The revival of any style or period of architecture, whether English or foreign in origin, is an evil which tends to retard the due consideration of fitness in all its aspects.

Planning a House.

If we start a plan for a house with any preconceived example of a Classic temple or a Georgian mansion, a Roman bath, or even a Gothic monastery, we shall be the less influenced by the peculiar characteristics of the site, the building owner, or the purpose of our building. And it is from the consideration of these conditions alone that all the finest architecture throughout the world has ever sprung. Moreover, consider how immensely stimulating it is to all human powers to have to evolve your building from such sources. The delight, too, of searching for moral qualities worthy to be stimulated by our building is untold, necessitating also an interest in contemporary life and feeling, so keeping our work alive and growing, and avoiding the stagnation of stereotyped conventions of ancient times. But the present method is to accept first a Renaissance conception and then ingeniously squeeze your accommodation into and behind the shell, and classify your requirements to suit your thirst for symmetry. It is like a Chinese puzzle, a *tour de force*, a clever exercise in cunning, leading to all manner of subterfuges, and as such demoralising to all concerned.

English Domestic Work.

It is generally admitted that our English domestic architecture of recent years has advanced much more than the architecture of our public buildings and monuments. And I fearlessly assert it is because much of our domestic work has been produced by the method herein advocated, whereas our public buildings are invariably produced on the method condemned. And why? Mainly because the authorities who have to vote the money to pay for them are trying to please their electors, and they know that if they put up a hall-marked building—that is, something colourably like St. Paul's—no one will venture to criticise their choice or their taste. The word has gone round that St. Paul's is all right, and it has been repeated so often that Mr. Brown and Mr. Robinson find it a very convenient sample of good taste by which to gauge their public buildings; the architecture, according to the Alderman, being the outside jacket, and the added inside embellishments the gilt on the gingerbread, in fact, not one of them ever dreaming of the question—Is St. Paul's English? Is it a patriotic expression of our national character?

Public Buildings and Dirt.

If the importance of a careful study of national character and conditions were fully realised a student would have little time for travelling abroad; and if by the time he reached the age of forty-five he had made good use of his own country, foreign travel could do him no harm. But forty-five years is not enough time in which to learn everything about the resources and history of our own country. The more intelligent a man is the more he will feel how much more there is to learn than he can ever accomplish. If our modern public buildings are the outcome of foreign travel, who can defend it? Surely they are the deadest, uninspiring piles of wasted labour and material that any country can

show. Successful as dirt-traps and dust-catchers, emphasising the grimy nature of our town atmosphere. Here, then, we surely find in the rustications of our wall surfaces clear proof that the desire to adapt foreign detail has outweighed all considerations of fitness to our dirty town atmosphere. Innumerable are the examples of similar conformity to foreign styles, preventing due consideration of practical fitness; durability and cleanliness are sacrificed to imitative convention. The true mathematical proportion and placing of the Orders is regarded as far more important than the adequate lighting or convenient placing of our chambers. We ought no more to teach the five Orders to students than to train them in Chinese. Many will say that without the five Orders no sense of proportion can be taught. I do not think that with any Orders you can teach proportion. Proportion is a matter of feeling dependent on general culture and temperament. You may notice that every man's sense of proportion varies as much as the proportions of his body and limbs; and when he is sincere in the expression of his sense of proportion it is a reflection of his own bodily frame.

We can very well teach the character of materials and their proper use and limitations, but the less we try to teach art the better. Teach ethics instead, and make men think, and art will take care of itself.

It would surprise many of us if we were to consider the amazing effect on modern architecture the one study of cleanliness would produce. If we are to avoid dirt-traps inside and out we must concentrate our ornament and produce breadth and simplicity, both of which qualities demand good material and good workmanship. So by omitting conventional Renaissance detail we should be driven to devote much thought and feeling to the enrichments we have, and in the plain broad surfaces we should feel the necessity of well-chosen, genuine material and a high quality of workmanship.

Tyranny of Styles.

We can never arrive at these qualities if we are working to a definite style of the past. Use the past to supplement your experience of the use of materials, their possibilities and limitations, but do not be a slave to it. Do not depress young students by telling them they cannot possibly excel the noble men of old. Our increased experience ought to make us more able to excel anything that has gone before. The cultivation of patriotic feeling should make us devote more attention to English material, English conditions, and English character, and free us from the stigma of being called the most inartistic nation on the face of the globe.

Art, being the manifestation of human thought and feeling, must always be individual and national. Furthermore, the emancipation from the tyranny of styles would open the door to brother-craftsmen. We should feel the necessity for the work of the painter and sculptor in our buildings if we omitted the acres of machine-made Renaissance ornament. And brotherhood between the arts is what we need to stimulate, and it must necessarily follow the growth of patriotism in architecture.

The strongest argument in favour of creating buildings from requirements and conditions, rather than in obedience to any preconceived style or mode of expression, is that it opens the way for the appeal to our higher nature and stirs up the emotions and moral sentiments. It forces us to consider moral principles and work on definite lines of truthfulness, fitness, and fidelity. We at once see the necessity for investigating and making full use of local materials, or the economic conditions that justify imported goods. We are stirred to investigate all new inventions and fresh methods. This state of mind is one of perpetual alertness—on the look-out to seize every new advantage of modern times—and this healthy living condition is the most fitting wherein to recognise the true enduring qualities of life, viz., the moral sentiments. In our admiration for ancient buildings we forget that it is their manifestation of the spirit wherein they are great. The material we see is perishable and illusory. But in the spiritual significance and expression of moral sentiments they are indestructible. In our familiarity with materials we forget that it is always the spiritual essence that is the life and soul of our work. Not the form of our expression so much as the deep thought and feeling it betrays.

Can we not emulate Shakespeare in our architecture, and by patriotic feeling express and encourage what is best in our national character?"

Mr. Arthur Keen also contributed a paper, and said:—

"Let me say first how much Mr. Voysey's presence here this evening is appreciated by us. He has not hesitated before now to tell us frankly that he did not approve of our methods of education, but by coming to speak to us to-night he shows that he is moved by no narrow or dogmatic spirit, but is anxious to help us in our study of the art for which we share his affection. The position he takes up is a strong one, for, although he perhaps will not admit it, his appeal is to our feelings rather than to our judgment; and he speaks with the seriousness of conviction because it is well known that to the extent of his opportunity he has carried into effect in his own practice the views that he holds of the possibilities and limitations of architectural art in the present day. But that he is right in his main contentions I cannot agree. If he had put them forward thirty years ago they would have been received with enthusiasm, for the spirit of the mediæval past had a strong hold on the architectural imagination at that time; but the Gothic Revival has passed. And what has it taught us? It has taught us that it had to fail because we are no longer Gothic; that the Gothic tradition ended long ago, and cannot be conjured back to infuse our work with the vitality and personal quality that belongs to the old because our character and disposition have changed, our social conditions have altered, and our attitude towards all things has become one of doubt and inquiry in the place of submission and faith. Why should we live in a fool's paradise and imagine that things are other than they are? It never has been any use, and it never will be. We are eager and self-seeking we have acquired education, we have travelled and seen the world; we have facilities for the interchange of ideas and commodities; our methods of life and industry, our political views, our very religion has altered—we are the products of an eager, ambitious civilisation, dominated by science, by competition, by individual liberty, and by aspirations, hopes, and ideals different from, and opposite to, those of the past.

In many directions, however, there seems already to be a more general concensus of feeling, a broader basis of authority, a more definite conviction as to wide principles; and is not this coming about in the matter of art as in other things? Are we not already weary of each man doing that which is right in his own eyes, and is not the cry for a Ministry of Fine Arts the outcome of a desire for peace and good order, sobriety and restraint?

Convention.

Convention, social restraint—call it what you will—is it possible, human nature being as it is, to get away from it for long? Man is a social animal, and is, and always has been, ruled by convention, by the general acceptation of right and proper usages. It is an inborn sense, and collectively he cannot get away from it. However much an individual here and there may kick against the pricks, our architecture must be conventional if it is to represent us truly; and it should be of such an order that it can yield good results to a formal, academic method of expression that is able to associate itself with science and orderly civilisation, and with the commercial and social conditions that now obtain. An architecture that depended on the detached and original attitude of each individual would be intolerable. Wise restraint is almost always to be preferred to uncontrolled individualism. In the best days of architectural art and of the development of that art convention was universal—buildings, whether temples or churches, as much as ships and fortifications, were made on orthodox lines. Growth along those lines, not departure from them, was the constant characteristic. Indeed it is difficult to reconcile the design of a Greek temple with what one knows of the artistic aspirations of the Greeks, except on the principle of overmastering convention. A somewhat rude, ungainly type of building, impressive and dignified in its simplicity, but lacking the resource and imagination that we associate with Gr sculpture and decorative design.

There certainly seems now to be a desire impose a definite and generally recogni method of architectural treatment, because struggle has gone on long enough, and we that in unity of effort lies our only hope achieving in any worthy way a form of exp sion that can be considered national; so t by these forms and these methods shall th who follow us know that this was the work of British nation in the XXth century.

Revivals.

What is the logical outcome of the object to sending the young man out to see the wor This, as well as the suggestion that he sho work only in the material of his district, is echo of the time when no facilities for travel traffic existed. It would make the student i a kind of ancestral beaver, secure in his lod protected by his dam, snug and self-satisfi without incentive or imagination or horiz Are we not to take the world as it is, and are to try and force our part of it back into position it has left long since? I agree w Mr. Voysey that the revivals that he deprecat are lamentable enough, although in a meas they express faithfully the national attitu towards things; but I submit that the cou we have had our attention directed to by h involves a greater revival than any we have h before—a revival of former social conditio rather than one of mere architectural form and I think that to be successful it involves t architect in becoming a mason, or a sculptor, a carpenter again; for, if I understand aright t qualities that Mr. Voysey desires, they are to obtained in no other way. We have had ca enough, and to weariness, of endeavours aft texture and local character, and the appearan of "craftsman" art, obtained by laborio detailing and by close supervision of the wo man, and I say, without hesitation, that su efforts are wrong artistically.

We have to produce our architecture at t drawing-board and by means of specificatio and letters and bills of quantities; for Heaven sake let us be honest and admit it, and not t to pretend that we are treading in the steps our ancient brethren when we are beset abo with contracts and by-laws, with Coun Council applications, with party walls, and wi all the appliances and products of science a commerce. I was shown recently on a lante screen two pieces of brickwork—one a genui piece of XVth-century work with all the char of irregularity and texture upon it and in t the other was confidently put forward by t lecturer as the best bit of modern brickwork had ever seen; it aped the characteristics of t old work in its irregularity, but to me it was slovenly, untidy, rough bit of work that wou have been a disgrace to the bricklayer if one ha not known that the poor man, no longer fr to work in the accepted way, had been made do it, by the architect, as a deliberate piece affectation. We are not mediæval bricklaye or masons; why should we pretend that we are I do not think that Mr. Voysey wishes us to so, but I do submit that what he suggests to really involves us in something of this kind, f he claims that architectural character is to gro again out of the nature of the material, and right uses in order to meet the needs of t time and express the ideals of the individual: I understand it, this is the mediæval attitud and involves the mediæval method.

We are to make our work national again, b when was it ever national in the sense of exclu ing foreign influence? It has been in a consta state of change since the beginning of o civilisation, and I think it would not be difficu to show that most of the change has been due foreign sources.

The Saxons came from over the sea; o Norman architecture was an importation Westminster Abbey itself is on a French mode Mr. Lethaby has been making startling sugge tions lately as to architectural beginnings, a the transfer of features and of methods of co struction from one part of the world to anothe And why should not this transference tak place? Does the delightful little bridge Prior Park fit less well into the English land scape because it is in a sense an exotic? A not the bridges at Cambridge or Bath home and natural, although they may be based foreign models? Is not Stamford a chara teristic English town, although it is full Palladian work? In every age and place th art of the native craftsman has been tinged ar

used with the foreign influence. Here in gland it has proceeded side by side with that he professional architect for many genera- is, "stealing and giving" charm.

National Character and Style.

The "sincere expression of national character aspirations"—what is it? What does it an in these days? I am reminded of a oon that appeared in *Punch* some years ago wing a servant coming to Lord Beaconsfield h the announcement of a deputation below iring information as to the Conservative gramme. "Tell them," was the reply. at we propose to rely on the sublime incts of an ancient people." It was a well- nding phrase, but had it any real meaning? d what does the sincere expression of ional character mean? And what does atriotism in Architecture" really mean in se days? Does it really mean anything ept that we are to use everything that comes us in a reasonable way to suit our own ticular needs?

Ve need be under no misapprehension that a le of architecture that does not faithfully e the national need will endure. Mr. sey is severe on our town halls and banks railway-stations, but to the extent that ir architecture does not meet its require- nts it already stands condemned. Is he not tuly severe with these buildings? He seems deprecate symmetry in design, but surely a n hall is essentially a building that calls for h design; its plan must be simple and ular; the requirements of it suggest and ose uniformity and repetition. The axial tment is the right one. And is not metry in the design of domestic buildings a at factor of beauty? Are such houses as ntacute and the great Jacobean mansions the house in West-street, Chichester, the se for it? I submit that house planning never more sound and serviceable than to- ; but when have we had more striving after larity and balance than at the present time?

ecognition of Materials and Conditions.

Ir. Voysey says that a national style can grow up by a recognition of our con- ons, material and intellectual; that we must y the Divine law of fitness. Nothing can be e true or better expressed; but this does not us off from foreign influence; on the con- y, it leads us to it, for we are Cosmopolitan these days—not hide-bound, prejudiced nders. No doubt an architect may be ng if he makes his railway-station resemble Roman bath he has seen in his travels; but is no argument against travel. He would be ally reprehensible if he made it resemble ham Cathedral; but, on the other hand, a sound conception like the front of King's ss Station may be the direct outcome of ething seen in Spain or Constantinople.

think it is a fair claim that most architec- al students are, as a matter of fact, being ght to recognise all material and intellectual ditions, and to observe particularly the reme law of fitness. But it is on this point t the issue really depends, for the schools ocate the use of certain well-known archi- ural forms and features in design that is to ply with these principles, and Mr. Voysey ms that these forms and features are not issible; that they have no connexion with onable design, and that in fact they used for their own sake. I think he is it here to a very great extent, and that ures are commonly used in a wrong and itous way; but surely features of some are admissible, and why should not suitable s be adopted from old work, either native or ign.

fully agree that we must master, as far as can, as Mr. Voysey says, the unalterable anical qualities, the uses and character of erials, and the essential truths relating to r handling; but, as we have been told before , this leads us only to "pleasant building"; but a small part of architecture. Indeed, is architecture at all? Is not architecture ething added to building, something ressed through building, but in no way ntial to it?

Education, etc.

Ve have been told that our present methods ducation are steadily leading to an artificial de of expression, independent of the practical essities of life. Now, I doubt this very ch. I believe our education is endeavouring keep step with other education, and to equip the student to meet what must be regarded as the practical necessities of modern life. I do not want to be misunderstood or to put myself in a false position. I admire and love the old things; I would rather go out of my way than let an old bridge or a Whitgift Hospital be pulled down; I would look through wavy old glass rather than have it replaced by plate; but the methods and the ways of life that produced them belong to the time that is gone for ever, and can no more be called back than the Psalms of David can be written again.

I think Mr. Voysey is quite sound when comparing the past with the present. It is too true that, while we have gained knowledge, we have lost insight; we have got experience, but lost imagination; good taste is no longer spontaneous; the unerring instinct and judgment of the craftsman are gone, and we can no more work with the methods of the past than we can regain the blind unreasoning faith of our Calvanistic forefathers.

There are all sorts of questions about durability and cleanliness and colour on which I should have liked to join issue with Mr. Voysey if there had been time; let me merely interject here that in places where smoke and soot predominate the rougher and not the smoother a building is the better; for even soot will reflect light if it is in irregular lumps, but not when it is a smooth greasy skin over a polished marble or smooth ashlar surface.

It is to the main characteristics of sound and scholarly design that we must look in these days, not to the touch of the craftsman. To breadth and proportion, to light and shade, to balance and composition and contrast, to sound and obvious construction, to fitness, to beauty of detail, to cheerfulness and light. We are not German, or Italian, or American, or French, and everything will be done in our own English way; if we are all soundly taught, and taught on similar lines, our architecture will be worthy and dignified, free from vulgarity or untruth, and we need not fear that it will not be national. But to begin the whole thing anew and invent our architecture again or evolve it anew out of methods of building, while turning our backs on what the past has to offer us, merely because it may not be of English origin, seems to me to be to invite disaster and chaos; just as wrong as to destroy all our pictures and to learn painting again.

But let me conclude as I began, by expressing appreciation of the service Mr. Voysey has rendered to us by what he has been saying. He has initiated the discussion of a mater of great interest. He has condemned all that is mean or vulgar, sordid or dishonest; he has held up to us an ideal of the highest kind—an ideal that I believe myself to be incapable of realisation by reason of the conditions that now control us, but an ideal that he has put forward with sincerity and conviction; an ideal that we may always keep before us to correct our judgment, to form our character, and improve our aims. If we do not perhaps see eye to eye with him in the method of its attainment, we all share his hope that the architecture of our future shall be noble, pure, and inspired, worthy of its past, and in the highest sense national and expressive of national aspirations."

Mr. Harrison Townsend

said he thought Mr. Voysey would have done well to have given a definition of "patriot" at the beginning of his paper. Dr. Johnson said that a patriot was one whose real passion was a love of his country, and, although the dictionary might give that definition, it did not quite read into the word what Mr. Voysey had read into it, nor did it read out of the word that which Mr. Voysey had excluded. A patriot was a lover of his own country, but he was not necessarily a despiser of another country. Dr. Johnson had also said that "that man is little to be envied who would not gain force upon the plain of Marathon." There was a wider patriotism which did not exclude what could be gained from the teaching of other countries. He once asked a gentleman to go to Italy, and he said that the work was dreadful. His reply was, "If you don't go to look for what is good in it, go and see what is bad in it." The more evils one left uncommitted the more virtuous one was, and the more evils one sought to avoid in our work the better the working. After all, the whole sum of their knowledge was not great, and if they were to confine their knowledge to their own country, why not go further and make it a parochial thing and simply confine it to a district? He held that if they could increase their sum of knowledge by travelling abroad the better Englishmen they would be when they came back and knew how to apply their knowledge. It had been said that "Home-keeping youths have ever homely wit." Mr. Voysey might score on him by saying that was exactly what he wanted, but it was not the sense in which Shakespeare used the word. He did not think Mr. Voysey could have put a worse witness in the box for his own case; but out of thirty-nine plays which Shakespeare wrote not a third of them dealt with English subjects. Shakespeare went to Greece and Rome, and he transmuted what metal he brought back into a finer metal of his own English thought. Shakespeare did exactly what they wanted their young men to do when they went abroad; they wanted them to come back richer for what they had seen, but none the less Englishmen.

Mr. A. T. Bolton

said he was afraid the sentiment of the meeting was very much against Mr. Voysey's attitude, but at the same time they ought to realise the great influence which Mr. Voysey's work had had on people. It was extraordinary how men like Mr. Voysey with his intense convictions, and doing work of the character he did, had influenced the work of other people. When Mr. Voysey's work first attracted attention it raised great interest in him personally, because so much of it seemed to him influenced by the grand old cottages there were in Sussex. But much as one admired Mr. Voysey's buildings, he did not think they could accept his gospel. What may have answered very well in his own case might not answer in the case of others, and the basis of the whole thing, which was that they might do work without reference to what had been done in the past, was historically untrue. The more they came into contact with old buildings the more they realised that right into the heart of the Middle Ages the influence of Rome existed to a considerable extent. Many of the Romanesque builders were trying to do real Roman work. The remains of Roman work scattered all over Europe haunted the imagination of these builders. They went to Rome and came back, and thought they were building things in the Roman manner, and the importation of marbles and things of that sort went on constantly. Kent was a very bad county for Mr. Voysey to mention, because they had only to scratch the soil to find Rome. Seriously he believed that those students who had travelled most were those who best understood their native work. When they had spent any time in a country, as a rule they found out the local attitude and understood how certain features were the outcome of local conditions, and when they came back to England they generally understood better what the English peculiarities were. He thought foreign travel was positively beneficial in enabling people to understand their own country. The question of climate was a difficult one, and seemed much more plausible than it really was, because in France, for instance, the climate varied enormously, and so it did to a considerable extent in this country, and therefore they could not classify climate and say there was a definite English climate and an Italian climate, and so on. When one honestly tried to do a building which simply met the requirements of the case, giving the light and convenience, and using the material at hand, as a rule, people would say the general effect was dull, and they wanted something more. It was like the question put as to the arcades to old cathedrals. They were simply put there because people liked them. It was the same with these Orders and things which were introduced. It was easy to say they were not necessary, but if people liked them, and they gave a certain flavour to a building which did not otherwise exist, and they found they were used everywhere, then they must come to the conclusion that there was some human necessity for them. He could not sympathise with Mr. Voysey in his dislike to St. Paul's Cathedral, and he thought that gentleman had made an unhappy selection, because it derived its plan from Ely. Wren had a knowledge of Gothic architecture, for which he was not sufficiently accredited, and he understood the spirit and ideas of Gothic architecture. In St. Paul's Cathedral they had an extraordinary adaptation of English ideas with true Renaissance detail, and Wren was triumphantly justified in what he did, because St. Paul's

received the homage of a third of the population at the present day. When Turner said that St. Paul's made London he was expressing the sentiment which every Londoner had always felt. St. Paul's was not a mere copy of some Renaissance church, but it was in its way a very English design. The reason why they taught the five Orders was just this, that they taught the student a great deal about proportion. The Orders by thousands of years' use had arrived at certain results, and no student could possibly lose anything by studying a system of Orders which had been practised by so many distinguished men in succession. They taught also a certain independence for the moment of dimensions, and it was not a bad thing for the student to work out a design which was all related to one figure as it were. He obtained the idea that all details were related to the general result, and he learned a great deal if by applying the Orders to a design he learned to bring all the parts of the design in relation to a certain standard. As to the teaching of ethics in relation to architecture, Ruskin had tried to do it, and where he failed he did not think they would do much good.

Mr. Allan Potter

said he had a great deal of sympathy with Mr. Voysey's point of view if he read it aright, viz., that he was up against students going abroad and being struck with something pretty, coming back here and reproducing it in England with no direct relation to English architecture. That was as far as he went in sympathy with Mr. Voysey. When Mr. Voysey said they ought not to teach the Orders, he believed he was absolutely wrong. They ought to teach the Orders of architecture just as they taught Latin and Greek. It was not that they should write Dog-Latin, but that they should write good English. They wanted free thought and logical and scholarly study of the architecture of the past. They did not want to study either the Parthenon or St. Paul's in order to copy them. Westminster Abbey was inevitable in its day, and so St. Paul's also was inevitable in its day, owing to changed circumstances and changed social conditions. But because St. Paul's was suitable to its day it did not mean that it would be suitable for to-day. They ought to look to St. Paul's and to Westminster Abbey in order that they might produce equally fine architecture and suitable to the present day, as were these buildings to the day in which they were built. The Greeks started with what their ancestors left them, and discarded that which was inharmonious and unsuitable, and the result was that they produced style. An intense study of Greek architecture would teach them what was meant by style.

Mr. H. W. Brittain observed that what Mr. Voysey was really against was the spirit of the times.

Mr. A. E. Bullock

remarked that in all things this country depended largely on foreign importations, and if they had to depend solely on their own productions they would starve. They had adopted a great deal in classical architecture, but there was one thing they had yet to adopt, *i.e.*, interior decoration. If they could treat style of foreign work, thoroughly understood and produced, they would find their architecture would put on clothing which would make it more presentable and satisfactory.

Mr. C. G. Boutcher

said Mr. Voysey had told them that fitness was an essential. That being so, if they depended for their teaching on this country alone they would have to adopt the old Moot Hall for their town halls, and he thought Mr. Voysey would hardly say the old Moot Hall was suitable for the new London County Council offices. They had no tradition of their own in public buildings, and therefore they must go abroad and get the best they could.

Mr. A. Smithers

asked what would be considered local material in London, and also if Mr. Voysey would allow ferro-concrete to be faced up.

The President

said he must admit that his sympathies were really with Mr. Keen. Mr. Voysey, in the expression of his strong individuality, had really quite over-ridden some facts of history. He did not think they could argue from the local material standpoint so strongly as Mr. Voysey endeavoured to do, because the Greeks always disguised their materials. The early English craftsman always whitewashed his church or cathedral. He thought, however, that they would all agree with the noble ideals the author had put before them.

Mr. Voysey,

in reply, said he was surprised at the courtesy he had received, seeing that he had come to throw mud at their idols. They had all shot at him, but he did not feel the least killed. The point he wanted to make was that they should get their architecture from within, and not apply it from without. It was true that there was always chance except in one thing, and that was in moral sentiments, and those were the things they had to hold on to if they wanted to help one another, and it was out of those moral sentiments that the finest architect had ever come and ever would come. The whole trend of the discussion seemed to be that they had far better go on crutches than try to walk alone; and if they had only one leg perhaps they had better.

It was announced that the next meeting would be held on April 15 when Mr. Laurence Weaver will read a paper on "Some Scottish Houses of the Renaissance," and the election of officers for the Session 1912-13 will take place.

THE CARPENTERS' HALL LECTURES:

THE CRAFT OF THE BRICK AND TILE MAKER.

THE ninth of the present series of lectures at Carpenters' Hall on the Arts Connected with Building was delivered on Wednesday last week at Carpenters' Hall, London wall, by Mr. W. R. Hoare, whose subject was "The Craft of the Brick and Tile Maker."

The lecturer, who showed a collection of bricks and tiles, said:—In considering effects of brick and tile he would presume that his hearers were only interested in what can produce a true artistic effect, and he would therefore eliminate all methods of producing bricks and tiles by machinery on the ground that, while it may be possible to produce a building or a group of buildings with machine-made bricks or tiles, which may have a not unpleasing effect at a distance in a dull light, it is only in the hand-made goods that the craftsman's art appears; he would therefore deal with the hand-made, sand-faced brick and tile as it had been made in the South of England since the days of the Romans

Materials.

To deal first with the materials, clay exists in varying quantities in big beds or in "pockets" in a great many places in the South. The best clays for the hand-maker are those on the surface, which are mined to a depth varying from 6 ft. to almost 40 ft. The clay is dug in the winter, exposed as much as possible to the disintegrating forces of the weather, must be totally free from any gravel or lime, and, when fit for use, must be tempered with water by hand or machinery to about the consistency of mortar, when it is fit for use in the mould.

The other main material is sand. This was used, in the first instance, quite dry and sharp, in order to enable the moulder to disengage the warp of the clay from the mould without damage to the sharpest arris of his brick. It plays a very important part in the subsequent colour and texture of the brick. It is perhaps necessary to point out that where the best clays are used no sand is mixed with the clay; it is only applied to the surface of the brick in the mould.

The moulds are all made of the finest beech of at least four or five years in plank, shod with hoop-iron. In the old days wood and gorse were almost exclusively used for burning, but with dearer labour and improved transport coal has become the only possible fuel.

In making, bricks can be divided into two classes—those which can be made and dried in the open air from about April 1 to October 10, and those which must be made in the sheds and dried evenly without extreme variation of temperature. The first class includes all bricks which are used in the main body of a building from 1¾in 2⅜ in. thickness.

These are made in a slip mould which no bottom or top, only a case with four s fitted on to a stop on the brickmakers' ta The "frog" is on the stop, which is sand face of the brick, the surplus clay b struck off the top of the mould with a woo strike; it follows that if bricks are requ to be laid flat showing a sand face they r be specially made in a mould with no f a fact which is not always borne in m These bricks are then put down to dry in open air on long wooden hack boards protected from the sun, wind, and rain "caps" and "lewe" boards until they dry enough to stand the weight of n tiers in the kiln; generally speaking, it quires about a month for this. Needles say, frost is the one enemy against w it is impossible to guard in the outdoor cess, as it ruins any bricks which are comparatively dry.

Any bricks or tiles thinner than this to be made in sheds, because too rapid ing, either from heat or wind, causes t to crack.

This also applies to delicate-mou bricks in which the thin edges, if allo to dry more rapidly than the body of brick, crack and spoil.

Under the stress of modern conditions effect of the brickwork in the main of the building is quite as important as finish of the detail, and in one respect moulder's work is perhaps the most portant.

Texture is produced entirely by moulder; in the first place, the way in w the warp of the clay is handled, giving big wavy lines, and secondly in the free of dry sand, which produces the mino equalities on the sand surface of the to be seen after burning when the free comes away. Apart from this, it is n sary that every brick should be the r of a uniform amount of pressure into mould, or else there will be an uneven sh age in the drying and burning.

In a stack of bricks sixteen courses it is quite easy to identify those made big, strong man using much force those made by a small man; there wi 2 in. or 3 in. difference in the height o stack. It is also essential to guard ag sand flaws; a slovenly workman in shapin warp will allow the sand face to get r into the brick, at which point the brick be unsound and part.

The other all-important feature is colour of the brick, and this lies in department of the manufacturer. C depends upon three things—judicious m materials (clay and sand), the kind of and the amount of fire given to each vidual brick in the kiln.

Colour Effect of Materials.

Roughly speaking, it is the amount of of iron present in the clay and sand w determines the colour of red bricks, an this varies with the beds of clay, the b maker has to adjust the other circumsta to suit the materials. We have been u to determine how far sand, used only ternally for moulding, can effect the c of the bricks. This much is certain, th is possible by use of a good sand to colour an appreciable distance into an ini clay; further, that, by using a great different sands for moulding, you can pr quite distinct shades of colour in the kiln, but there is no evidence to show what lapse of time this colour effect wear off the brickwork. In any case, quite clear that the prime necessity is a foundation colour in the clay itself, v will stand the test of all time and onl prove with age. Whatever sand be use body of colour in the clay will show w ever a brick is chipped, and predom eventually in a large face of the brick We look, therefore, to the inherent colo the clay for the main effect of colour can vary it to a limited extent by th of sand.

Pigments.

Perhaps this is the right place to me the use of pigments. It may be possible these to produce an effect which is fo time pleasing. There are in particular

ned tiles which seem to stand the test of e, but the whole question turns upon a 'h larger one, *i.e.*, the period at which architect wishes his building to arrive naturity. Often it may be necessary, for ance, to match old work in an addition to existing building; or the juxtaposition mellow brickwork may make it impera- to anticipate nature. At the same time, submit that fire judiciously applied can an effect which will satisfy the require- nts of the present and be infinitely more utiful to the generations to come. For reason he passed over as unworthy of highest craftsmanship the use of pigments rickmaking.

Kilns.

There were three classes of kilns which d be considered (burning bricks in clamps ht be dismissed from consideration as aining solely to the realm of cheapness hout a chance of beauty) :—The Scotch , which was a square case with fire-holes el with the ground, the fire passing up- ds through the bricks; down-draught kiln, h a domed roof, in which the fire, applied ough fire-holes as in a Scotch kiln, is ried up in chimneys inside the kiln above bricks, and descends through them to a in the centre of the kiln, thence under- und to a shaft close by; continuous kiln, which the main principle was a succession chambers, the heat from one chamber ng used to dry the bricks in the next with reat consequent economy in fuel.

There are still in existence a few old kilns which wood can be used for burning, with result that you obtain a fine glaze on brick, which is accentuated by the use furze in the final stages. But these are uneconomical that they have practically d out; one man can only burn about 000 bricks at a time, where he can burn 000 to 60,000 in a Scotch kiln, and a much ater number in a continuous kiln.

till, we must recognise the fact that the k, if not all, of the beautiful old brickwork the South of England was produced from is fired with wood at the time when the nsport of coal must have been a serious blem. Now, however, coal is the uni- sal fuel.

n dealing with this question of colour, by the best results are obtained from Scotch domed kilns, which do not suffer from deleterious effects of steam from the dry- bricks. The bricks in the kiln nearest fire will contain a large proportion of ed bricks, which can be set so as to ive the flare upon either the header or tcher side. Through the middle of the a are obtained good dark and medium- oured bricks, while there must always be ertain proportion of light bricks furthest m the fire.

t follows that when a certain range of our is required it can be obtained by ulating the place of the bricks in the n, and great variety can be obtained in the ual setting of the bricks, as, for instance, bars of flare which come when the bricks placed crosswise over the fire-holes.

f the bricks put into a kiln are reason- y dry, the first part of the burning, "the ing," should not take more than forty- nt to seventy-two hours. This is done wly with small fires until all the steam been driven out of the bricks. The burn- proper then begins and may take any- ng from fifty-six to 100 hours, till the ole kiln is one incandescent mass of light rnrose fire. At the proper moment the -holes are damped down with clay, as cold entering a hot kiln will crack everything h which it comes in contact. The kiln ains closed for about forty-eight hours, after this time is cooled quickly.

A Scotch kiln can be emptied within one k of burning, kilns with domes or mbers taking neessarily longer to cool.

rom what has been said it will be seen t the whole process, allowing for about three s to set a kiln, takes between six and en weeks. This applies to normal weather circumstances. In the winter, when all ks have to be dried artificially, or when the beginning or end of the season there ery little drying weather, longer time will required. Any order for bricks requiring cial attention should be given ten weeks dvance. This should allow time for them to be given their proper place in the right kiln.

Shrinkage.

There is another question in view in that of colour, *i.e.*, the shrinkage of the brick. Happy is the brickmaker who has to work only one class of clay with shrinkage at a constant ratio.

The bulk of the shrinkage takes place before the brick reaches the kiln. To take the case of my own bricks, these will have shrunk from 13½ in. as they leave the mould to 12½ in. when they are fit for kiln; fired to medium colour, they will emerge from the kiln at 12 in. Should it be necessary, however, to fire them harder, anything up to an extra ½ in. will be added to the shrinkage.

Many clients who desire bricks with all the various shades of blue that fire will give are apt to forget that this involves a greater contraction.

It is especially necessary to note that if perfectly true results are required in moulded bricks they must all be burned to one colour on the light side of medium.

Any attempt to impart special colour to moulded bricks burned over a series of kilns will inevitably involve some inequality in shrinkage. Uniformity is quite easily obtainable, but at the expense of appearance. He was personally of opinion that the slight play given to a medium-covered brick through the centre of the kiln rather adds to than detracts from the charm of the gauged brickwork.

Moulded Bricks.

The slip mould is a square box, costing from about 5s. to 30s. The difficulty of dealing with moulded brickwork lies in its complexity. To start with, we make bricks in varying thickness from 1 in. to 2⅝ in. In many of the ordinary patterns we have to stock these in various thicknesses with internal and external angles of different degree, of which very few will be used at a time. A moulder, however heaven-born a genius, always takes some time to adapt himself to each fresh mould.

It is very much cheaper to make each section by the 1,000 than the 100, or by the 100 than in units. The cost of moulds also becomes a much less serious consideration if 100 are made out of a mould costing 1*l.*, than if only four are, as is sometimes the case. What I am driving at brings me on to difficult ground, but the whole future of moulded brickwork seems to me to turn upon it—that is, the recognition by architects of the fact that the interests of their clients demand some alterations in the etiquette of the business. It is extremely difficult, with the best intentions, to draw the line at what is or is not the private copyright of any man ordering a design. The time will come, if brick designing is to go ahead, when each designer will feel justified in accepting designs in existence and not, as often now, go through the farce of some trifling alteration which may involve a whole set of new moulds.

Limits of Moulded Bricks.

It may be desirable at this point to mention what are the reasonable bounds of possibility in moulded bricks; whereas plain straight bricks and tiles can be made 18 in. long, and made quite true and sound, it is not desirable to make ordinary moulded bricks more than 14 in. in length. The dimensions are finally governed by the weight of clay that a man can lift to put into the mould.

It is difficult to realise how seldom the moulder has the opportunity to see his handicraft in the building when complete. In one of the first moulded houses we undertook the lady client invited all the party to tea and see the work. It was quite touching to see the pleasure given to old moulders in tracing their bricks through the building and seeing how they came in.

It is regrettable to find that the old race of hand-moulders is dying out; whereas it used to be the custom for all the boys of the family to help the fathers in the yard from very early years, it is now the rarest thing to find a boy. There will in ten years be a great scarcity of men coming on. The life is a hard one, but a good man can earn good money at it.

Some system of apprenticeship will be necessary if the trade is to survive.

Matching Old Work.

It would be impossible to pass over what is a most important feature of the craftsman's work, *i.e.*, the suiting of his material to its surroundings. It is quite a common thing nowadays to ask the brickmaker to match a building 100 to 200 years old. This is all very right and proper where an addition has to be made to an existing building, but it is open to doubt whether it is a sound art to aim at producing ready-made what is really the effect of centuries. It provides the brickmaker with much of his most interesting work, but often taxes his ingenuity and the resource of his yard and district beyond endurance.

THE INTERNATIONAL SMOKE ABATEMENT EXHIBITION.

An International Smoke Abatement Exhibition, organised under the auspices of the Coal Smoke Abatement Society, was formally opened on Saturday last week at the Royal Agricultural Hall, Islington, by the Duke of Argyll, the President of the exhibition.

At the subsequent Luncheon, at which Sir William Richmond presided,

Sir William Ramsay, K.C.B., LL.D., D.Sc., F.R.S., President of the British Association, in proposing "Success to the Exhibition," suggested that just as deposits of salt were worked, not by mining the salt, but by pumping in water which was recovered as brine, so it would be ideal, instead of mining coal to have retorts in the bowels of the earth for the production of gas. A boring might be put down to the coal strata, the coal might be lighted where it was, and air and water might be passed down so as to produce hydrogen and carbon monoxide. The resulting gases might be used in gas engines at the pit mouth for the production of electricity, which might be distributed by high-tension currents to any desired point. That would settle the strike problem, and he suggested that the miners should consider very carefully what they were doing, lest it should be found that the country could do without them. The resources of science were not exhausted, and a plan such as he had suggested might enable electricity to be used for heating, at a price of perhaps one-hundredth of a penny per unit.

Sir William Richmond, K.C.B., R.A., President of the Coal Smoke Abatement Society, in reply, said what we had to do was to enlist public opinion upon the subject—to interest it and to remove if possible a certain apathy which belonged to the strength of the English character. The Exhibition ought to enlighten the public, for the appliances shown were numerous and ingenious and not unlovely. However firmly they might be attached to science, they would admit that Beauty had, independently of other things, a great function to perform in the world—a function which was ennobling and refining. The English people once had it in a large measure, and he believed they would again possess it. Through their efforts we should have again a white city and a healthy people.

Dr. H. A. Des Voeux then proposed the toast of "The Visitors," which was responded to by Mr. Goff, L.C.C., Dr. Shaw, Director of the Royal Meteorological Council, and Dr. Bostock Hill, President of the Medical Officers of Health.

SMOKE AND BUILDINGS.

In connexion with the Exhibition during the present week a series of conferences have been held dealing with the whole subject of smoke prevention and abatement. The first sitting was held on Tuesday, under the Chairmanship of Mr. W. Whitaker.

Mr. L. W. Chubb (the Secretary of the Smoke Abatement Society) said there were seventy-one public authorities taking part in the conference, of whom twenty-one were Metropolitan Borough Councils. There were also representatives from the London County Council, from the Swedish and Dutch Governments, and from America. They had arranged visits to the Becton Works of the Gas Light and Coke Company, which was the largest gasworks in the world; to the Lots-road generating station of the Underground Railways Company; and to the Greenwich power house of the London County Council.

D

Effect of Smoke on Building Stones, etc.

Sir Wm. Church, in a paper on "The Action of Coal Smoke on Building Stones and Mural Paintings," said it might be affirmed that whatever be the injurious effects of the carbon and mineral waters in smoke upon the processes and functions of organic nature, it was not to these constituents, were they unaccompanied by other substances, that the damage done by coal smoke to building stones, to mural paintings, and to objects of metal could be attributed. They soiled and disfigured, but they did not, *per se*, corrode and disintegrate and alter. The offending constituents of soot were those which were associated with having been absorbed by the carbon which formed its basis. It had been estimated that the sulphur present in the coal annually burnt in London gave rise to an amount of oxidised sulphur compounds corresponding to half a million tons of sulphuric acid, or oil of vitriol. This compound soon oxidised with sulphuric acid, which was the chief destructive agent present in urban atmospheres. He might cite many instances of decayed stonework to prove this pointby the analysis of samples from buildings in Oxford, Canterbury, and London. For instance, the outer face of the Sheldonian Theatre at Oxford contained no less than 19 per cent. of gypsum, all save the veriest trace formed from carbonate of lime by the attack of atmospheric sulphuric acid. Magdalen College tower gave him more than 11 per cent. The interior walling of Westminster Chapter House contained just 18 per cent. of the same product, while St. Paul's Cathedral furnished a most striking instance of the destruction wrought by the suphuric acid in London air and rain. There was a blackish stalactitic incrustation hanging to the under side of the cornice above the colonnade and below the dome. This was some inches deep in places, and contained nearly 74 per cent. of gypsum or hydrous calcium sulphate. Whence did this deposit derive its sulphuric acid constituent if not from the sulphuric acid wasted out of the London air by falling rain. Soot falling upon some stones other than those which contained or consisted of calcium carbonate exerted upon them also a destructive action. If granite or other allied stone practically escaped corrosion, stones like serpentine, of which the main part was a hydrous magnesium silicate, were rapidly corroded, soluble magnesium sulphate being found to be washed away in the first shower. Sulphuric acid, again, was the chief culprit where paintings in true fresco were concerned, but there was one advantage which fresco enjoyed in comparison with the methods of oil and spirit fresco, viz., that when besmirched with tarry matter from soot and smoke this discoloration might be removed without interfering with the pigments. To show how the most solid gilding failed to preserve metal from corrosion, he might cite the gilt bronze screens at either end of the reredos at St. Paul's. These had been subjected to an atmosphere polluted with sulphurous acid escaping from stoves burning coke in the basement of the Cathedral. Modern research had shown how difficult and how well-nigh impossible it was to form an absolutely non-porous and continuous coating of one metal upon another. If cracks and other breaks in continuity were at first imperceptible, yet the unequal expansions of the two metals in consequence of temperature changes might soon develop them. In some such way one might account for the thick bluish-green crust, containing copper sulphate, which disfigured the gilt bronze grilles or gates in St. Paul's.

Mr. Noel Heaton

then dealt with the actual effect of damage from smoke on decorations which had come under his own practical knowledge. With regard to windows, stained glass should be little affected by smoke if properly executed. The gradual decay of the glass which was so noticeable in old windows was due to several causes, and although these were decidedly aggravated by contamination of the atmosphere, there was no real excuse for the premature decay one noticed in some modern windows, which was due to the use of improper materials and the improper use of materials. Both the glass and enamels used in properly executed modern windows were extremely resistant to decay, and the constant changes of temperature necessitated by modern needs in the way of warmth and light were far more potent factors in decay than smoke, the effect of which was practically limited to the dimming effect of the actual dirt. Passing to the question of the effect on the exterior painting of houses, he pointed out that the National Association of Master House Painters recently conducted a series of practical tests of paints, and whilst these tests could not be looked upon as in any way final, yet the general conclusion one arrived at was that smoke is by no means the most potent factor in the actual disintegration of the paint film which took place more rapidly in pure air and bright sunshine of the seaside than in the great cities. They must, however, remember that the surface of oil paint was by no means impervious to moisture, and smoke might under such conditions exercise a very insidious destructive action on the pigments mixed with the paint and the surface which the paint film was intended to protect, whilst leaving the paint itself undamaged. The effect of the smoke was more clearly felt in the case of works of art which form the permanent decoration of a building. In order to be seen properly in the comparatively dim light of the interior, mural paintings must be clean, and in a smoky atmosphere constantly depositing dirt this necessitated constant washing. The smooth, varnish like surface which alone would resist the adhesion of dirt and admit of being washed without mechanical injury was, however, extremely objectionable in a work of mural painting decoration; and, on the other hand, the matt absorbent surface which enabled the design to tell to the best advantage offered such a foothold for dirt of the adhesive nature derived from smoke that it was practically impossible to clean it efficiently. Decay of the pigments of a mural painting should not fairly be attributable to smoke, however, for it is quite possible to execute any internal painting or decoration with pigments that were perfectly stable and proof against attack, given sufficient technical knowledge and experience on the part of the artist. When they considered paintings executed on the plaster of the wall itself, either in oil or tempera, the effect of smoke was more disastrous, for the active agents of corrosion passed through the paint and attacked the plaster behind, with the result that one frequently saw such paintings peeling from the wall in places owing to the disintegration of the surface of the plaster. The destructive effect of smoke was, however, seen at its worst in the case of fresco paintings, for there they had of necessity a surface composed almost wholly of carbonate of lime in a porous condition, to which the dirt adhered so tenaciously as to be almost impossible to remove, and which was, moreover, attacked by the dilute acids in the same way as limestone, only more readily, because of its comparatively soft condition. Under normal conditions fresco was the most permanent, as well as the most beautiful, form of decorative painting, but under modern conditions some preservative treatment, such as impregnation with wax, which inevitably resulted in the loss of some of its charm, was absolutely necessary to protect it from rapid decay. It was scarcely too much to say, in fact, that the smoke nuisance had in towns rendered the execution of a satisfactory and permanent work of decorative painting one of the most difficult problems of applied chemistry.

Mr. H. Redfern, F.R.I.B.A.,

said the architect knew very well from experience that if he built in the country, right away from towns, his building from the time it was finished began to improve in appearance, and so long as it stood continued to improve, for Nature, if left alone, harmonised everything with herself. On the other hand nowadays he knew also that if he built in a town, his building never looked so well as when it was just finished. Legal prohibition of the use of sea coal in towns continued in force up to the middle of the XVIth century, and after the lapse of these Acts limewhite and pure colour little by little disappeared from towns, and so at length they came to take on the dingy, sooty, and dejected aspect which they now presented, for the use of either pure white or colour was impracticable in the towns of to-day. As in towns, the exercise of man's function of colour vision on natural features was im possible. He instinctively made an effort t supply the deficiency by applying to the sur faces of his buildings fresh and brigh colours, low-toned in large masses, and high toned in small, but always luminous. Fo many years now, however, the effort ha been abandoned in despair, for in towns to day no colour, however bright or highl glazed, would keep its purity for more tha a brief season. For the architect coal smok made pure colour effects impracticable, and fo the expression of his art he was confined both in mass and detail, to play of light an shade and variety of outline. But even i these means of expression he was, by th curse of coal smoke, very straightly limited In London no less than 650 tons of soot fe per annum on the square mile. To the archi tect the news came with no surprise, bu he had always been conscious that it was thing which constituted a serious facto among the many things which imposed re strictions upon his use of the means of ex pression of his art. It was evident, from th example they had had in such cases as th York Water Gate on the Victoria Embank ment Gardens, that soot deposited on archi tectural features must in time cause a con siderable alteration of their original form filling up recesses and marring the purity o the outlines. A much greater evil, however was that of erosion arising from the by products of coal combustion. From th moment the live stone was exposed to th influence of smoke-polluted atmospheres began to deteriorate. It was clear that th architect who considered the future appear ance of his stone buildings must take int consideration the two factors of soot depos and erosion, and that unless he made up h mind to forego all effects which might b attained by undercutting, delicacy of incise line, and sharpness of angular forms, hi building would very soon lose its origina force of expression, and would degenerat into a mere mass of dirty and shabb masonry. It was in stone that the trouble were chiefly in evidence, but woodwork an metalwork was affected, and in this regar the appearance of their public statues an monuments would speak for him. He sub mitted that by this curse of coal smoke th architect and the sculptor suffered the mo grievous restrictions in the exercise of h art, for not only was he subjected to th malign influence of the smoke on hi materials, but by the smoke pall he wa robbed of light of the quality required fo definition of form. Dealing with what th architect was doing to mitigate the evi which arose from coal smoke, Mr. Redfer said the method at present chiefly in u for limestones was the Baryta treatment. fir advocated by Sir Arthur Church, and it wa the method advocated by the Society fo the Protection of Ancient Buildings, an lately used by the Architect of the Londo County Council in consultation with th Chief Chemist of that body. The Societ for the Protection of Ancient Buildings al advocated the use of repeated coats of th limewash, made by slaking lias lime wit boiling water. Fourteen years ago M Thackeray Turner coated decaying stone Hatfield Church with slaked lime in a th liquid state, and so far it had shown no sig of further decay. When Baryta was use the Society strongly advocated finishing wi one or two coats of limewash, particularly i porous stones, and in cases where the u of Baryta had resulted in an unpleasa colour. The author spoke at some length o the methods adopted with regard to the Yo Water Gate, where recourse had to be ha to watering with a solution of caustic so and spraying with a jet of steam to get r of the bituminous deposits on the ston After cleansing, Baryta water was appli until the stone would take up no more; t average number of coats given was eightee About four weeks after the completion the work an analysis of the stone disclos that the Baryta had entered into combinati with the stone for a depth of at least ½ i from the surface, having the effect of co verting the decayed stone into a weathe resisting substance. Building stones oth than limestones were not so much affect chemically as mechanically by the soot, whi encouraged the absorption of rain water in the joints and held it under projecti features, with the result that frost caus

amage. To these stones the Baryta water reatment was not applicable, and water-roofing must be resorted to. Most of the ompositions on the market for this purpose ere not permanent, but the old method of coat of soft soap followed by a coat of lum dissolved in water was efficacious. nother method was a solution of ceresin ax in petroleum solvent, applied whilst ne stone was warm and dry. Statuary was idly affected by smoke, and all that could e done was to keep it clean by washing, nd protect by a thin layer of some water-roofing solution, such as the ceresin wax ith perhaps a little copal added to prevent ickiness; but in these cases surface tex-ures had to be carefully considered. In onclusion, Mr. Redfern directed attention the obstacle presented to an appearance f cleanliness by the presence of the bitumin-us deposits, and said the effect of the deposit as plainly apparent in cases where white-azed brick surfaces on painted buildings ad been washed down. Therefore, so long s coal smoke continued even building in azed brick or faïence could not, in the long m, retain it original purity of colour.

r. S. Rideal

ollowed with a paper on "The Effects of own Air on Metalwork," in which he ealt with a number of remedies for the ril adopted in this country and abroad.

Ir. Walter Reid, F.I.C.,

ought that architects were to be blamed mewhat for using the materials they did nder the existing conditions. There had een a good deal of money raised lately for onuments to King Edward, and he was rry to see that most of the designs included ich things as bronze and marble, which ere the very things which should be oided, for their climate was not fit for ch materials. He remembered when the ivoli, in the Strand, was built there were me beautiful marble columns and some onze work above, but in a year it could ot be recognised. They could also see that e limestone on which the Gladstone statue the Strand stood was turning a bright een. In Berlin they had carried out a rious movement with regard to building ones and bronzes, and had taken a leaf ut of the book of the ancient Greeks, who evoted two days in the year to rubbing eir statues with oil. As the result of the periment in Berlin they had found that imal oil was the thing which gave the best sults. Paraffin wax was very well while lasted, but it did not last long on metal. was better for stone, and he preferred it Baryta water. He understood that at anterbury Cathedral they had experimented ith arsenic acid to protect the stone with ccessful results.

r. Kinnaird,

the Battersea Borough Council, said he as a practical builder, and only the previous ay he had been called to see the side of a ouse which had been painted and which d turned black owing to the effect of the lphur in the air. There could be no doubt at the great loss of money arose from the tion of sulphuric acid on paint in London the way of changing the colour.

r. Watling (Bedford)

id that most of the public build-gs in the West Riding of Yorkshire ere of sandstone, and there had been a nsiderable amount of blackening. He ould like to know what Sir A. Church ould suggest should be done to restore them their original colour without damaging e surface of the stone.

r A. Church

id he did not know whether the process of turation would be of any use with sand-one, but with paraffin wax they could render e surface non-absorbent.

At succeeding meetings a large number of pers were read on different aspects of the estion of smoke prevention. These in-ded the following:—"Progress of the noke Abatement Movement in Germany," Herr I. Wies; "Smoke Abatement in nerica," by Mr. T. E. Donnelly; "Solid okeless Fuel," by Mr. W. D. Scott-Moncrieff; "Proposed Legislation," by Mr. J. W. Graham; and "Smoke and Fog," by the Hon. Rollo Russell.

[*** Some notes of the exhibits will be given in our next issue.—ED.]

TESTING OF MATERIALS USED IN REINFORCED CONCRETE.*

IN our last issue we gave the first part of a paper by Mr. A. Alban H. Scott on the Testing of Materials used in Reinforced Concrete, read before a meeting of the Society of Architects. We now give the remainder of the paper and some notes of the discussion which followed:—

TABLE 4.—RESULT OF GRADING OF SAND.

Sand.	Retained on 30 × 30	Passed 30 × 30, Retained on 50 × 50	Passed 50 × 50	TOTAL.
Sample 1	29·0 p.c.	15·5 p.c.	55·5 p.c.	100·0
Sample 2	48·2 p.c.	14·0 p.c.	36·8 p.c.	100·0

Effect of "Flour" in Concrete.—The question has often arisen as to the effect of very fine sand, or so-called sand, on concrete, and we have had two series of tests carried out on materials of this nature.

Table 4 shows the result of the grading of sand. Table 5 shows the test on cement used for the specimen pieces.

Table 6 shows the result of tests to ascertain the resistance of thrusting stress on standard sand and cement.

Table 7 shows the result of tests on the briquettes containing the very fine materials.

TABLE 5. TEST ON CEMENT USED FOR TENSILE TESTS.

Briquettes 1 in. by 1 in.

Neat Cement.	3 parts Standard Sand to 1 part Cement.

178
180
170
191
164

Mean 177·4 lb. per square inch.

Proportions. 3 Sand 1 Cement.
Age. 7 Days.

It will be observed from these tests that the average strength of briquettes with standard sand and cement gave a mean of 204·6 lb. at seven days, whereas the sand (Sample No. 1) gave only 105 lb. per square inch, and sand (Sample No. 2) which contained a less amount of flour gives an average result of 177·4 lb. per square inch.

On Table 5 the extraordinary different weights per cubic foot of cement is given. The same cement was used, but different methods of filling were adopted. It certainly confirms the necessity of most carefully considering whether the cement for all work should be measured by weight and not by cubic measure.

Another test made, as shown on Table 8, shows that with standard sand we get 182·2 lb. at seven days and 234·6 lb. at twenty-eight days; whereas with the test on "flour" sand as described on the Table we only get 53·2 lb. at seven days and 104 lb. at twenty-eight days.

A word with reference to the testing of the finished structure may not be out of place.

Specifications often provide for the work to be tested with one and a half times the load for which the work has been designed to carry. A factor of safety of four is taken in the calculations to provide for inequalities of workmanship and materials, for allowance for fatigue of material under strain, and for isolated accidental excess loading; considering that with one and a half times the safe load the concrete in compression is working up to 900 lb. per square inch, adhesion 150 lb. per square inch, 120 lb. in shear, and steel varying up to 22,500 lb. per square inch in tension; that by the application of such loads the parts so tested may be permanently injuriously affected.

If the materials are tested as suggested in this paper, and professional supervision is given

Received 8th Oct.

The Rock Dust used was that which passed through the 30 × 30 sieve. The Standard Sand was passed through 20 × 20 sieve, and retained upon 30 × 30 sieve.

The tensile strength of the Cement used in making the above briquettes was 480·0 lb. per square inch at 7 days and 583·0 lb. at 28 days.

Residue upon sieve 50 × 50, 0·0; upon sieve 76 × 76, 0·9 per cent.; and upon sieve 180 × 180, 15·9 per cent.

99, Southwark-street, London, S.E.
Nov. 6th, 1908.

DAVID KIRKALDY & SON.

to the work, tests on the finished structure are not necessary; if it is desirable, then only the safe load should be applied; and if no undue deflection takes place no further loading can serve any useful purpose."

Professor Henry Adams, M.Inst.C.E.,

in proposing a vote of thanks, said when they spoke of a factor of safety of 4 to 1 there was really no such thing existing; the factor was merely to provide for things that one knew would happen but which could not be exactly measured, and he was of opinion that in at least 50 per cent. of cases a factor of safety of 4 to 1 was in reality only 2 to 1. The author was to be commended for emphasising the need for tests being made in accordance with actual practice rather than under laboratory conditions. It was for practical use that tests were wanted, and in such cases the conditions in actual practice should be taken into consideration. The testing of aggregate to ascertain its specific gravity was only required as an alternative means of estimating the amount of voids, otherwise he did not know that it was of any practical value. The testing of the water, too, he thought, was only necessary when the source of supply was doubtful or when there was some reason to suspect the impurity of the water. In paragraph 14 the author had stated that the cement for each six sets of specimens should be taken from the same consignment. He (the speaker) thought that that should read "each set of six specimens," because it was necessary in all tests to have a number in order to get a reasonable average; a single test would not do. The perfect set of tests would include such a number of specimens as would give practically a continuous curve passing through each of the groups, which was one of the values of putting tests down to curves. He supposed that the welds referred to in the paper were end welds, *i.e.*, for the purpose of lengthening a bar; but there could be no possible objection to the electric welding in the crossing of the various bars. It was where tension came in that welding was objectionable. As a rule, the strength of a weld was 80 per cent. of the original bar. The 30 per cent. referred to by the lecturer must have been an exceptional case. With regard to the consistency of concrete, the general preference among specialists was for it to be in such a state that, after being tamped, the water just floated on the surface and no more, and the concrete itself was in a quivering condition. The author apparently advocated a drier mixture, but there would then be a greater difficulty in getting it into actual contact with the rods, especially underneath them. A cubic foot of "Ferrocete" cement was said to weigh 76·2 lb., and the weight of standard cement, the author stated, was 90 lb. The specific gravity was specified to be 3·1, which meant 3·1 times the weight of an equal quantity of water; so that if a cubic foot only weighed 90 lb., 3·1 times sixty-two and a half was 180 lb., then there must be 50 per cent. of voids in "flour" cement, although it seemed to lie quite close. The mode of filling in the measure affected very considerably the weight of cement, and that was the reason why it was desirable to take it by weight rather than by measure. The figure of 76·2 would probably have been increased to ninety if the measure had been filled in the standard manner. The author had referred to the rate of testing briquettes of cement, and had stated that there was an increase in strength obtained by putting the load on suddenly. He (the speaker) thought Mr. Scott should have said "an apparent increase," as there was no more strength in the briquette than if the weight were put on slowly. The indication of greater strength by adding the load rapidly was more remarkable in the testing of steel, and he remembered that in the earlier days, with the old-fashioned testing machines of the long lever and scale-pan type, the operator was supplied with a number of weights of various sizes, and it required a great amount of dexterity on the part of the operator to change the small weights for a large one of equal value before going on again with the small ones, the object being to get on as many of the weights as possible before the metal gave way. That was at a time when there was no recognised rate of applying the load.

Mr. E. C. P. Monson (Vice-President) seconded the vote of thanks.

Mr David Kirkaldy

said he was quite in accord with Mr. Scott in his remarks about the coating of grout, and he was very glad to hear from Professor Adams that the point would be got over in the final rules.

Mr. S. Bylander

said he had personally found it a very difficult matter to submit the various materials to tests. In the construction of the Automobile Club some hundreds of tons of cement were used, and he was very anxious that it should be properly tested. He therefore arranged that the cement at the works should be placed in bins and sealed, and then samples taken and tests made, and when found satisfactory the cement was to be taken to the job. The principal difficulty in carrying out more exhaustive tests seemed to be the question of cost. With regard to the testing of finished concrete, he thought it would be an advantage to have some rule to work by, and he hoped that the Engineering Standards Committee, or some such body, would take up the matter and issue some sort of rule. With regard to the form of the test pieces, he certainly thought 4 by 4 was not satisfactory, the aggregate used being too large in size to be properly placed; a 6 by 6 would be much better. The strength of steel being 62·272 lb. per square inch, he would like to know why Mr. Scott limited the tensile strength to 72,000 lb. He did not understand the author's reference to the elastic limit of steel. His (the speaker's) idea was that it was necessary to have a high elastic limit, because it was really that which determined the safety of the structure, and not so much the ultimate strength of the material. They did not wish to have a very hard steel, because it was brittle.

Mr. G. A. T. Middleton

said it had rather surprised him that both Mr. Scott and Professor Adams had remarked upon the fact that cement was now tested by weight per cubic foot, and he thought it would be very much better to test by specific gravity.

Mr. P. M. Frazer

said he thought that they did not quite realise that cement and steel could only be tested under laboratory conditions, which argued that the testing of made concrete was mor valuable than the testing of cement an steel. No means had been devised, so fa as he was aware, for testing reinforced con crete blocks, and it had often occurred t him that there should not be much difficult in testing a 12-in. cube of concrete slightl reinforced. As to the speed of testing an the running up of the apparent strength a few weeks ago he had been present at som testing operations at the makers'; he ha asked permission to use one of the machines as it was obvious that the men were testin too quickly. Upon easing the rate of load ing he obtained much lower results, wit the obvious retort that he knew nothin about testing. With regard to the weigh of cement and concrete, some added b weight and some by volume, but he, in h specifications, got over the difficulty b weighing the cement on the job and alterin the size of the gauge-box to accommodat 90 lb.

Mr. J. Herbert Pearson and Mr. H. T Cover having spoken,

The Chairman

said he had had very little experience in th use of reinforced concrete, but what he ha done had not turned out very satisfactory, no had he found it cheap. He had recentl had occasion to use it to carry a surfac drain where the foundations were too bad t support it in the ordinary way, and the loca authority had required him, on a 14-ft. spa with a beam 18 in. square, to use 2 in of steel. He might just as well have use steel joists. The supervision of reinforce concrete work put additional responsibilit on the architect, who, if he undertook suc work, should be paid not only for his pro fessional services, but for acting as clerk o works also.

The vote of thanks having been heartil agreed to,

Mr. Scott,

in reply, said with regard to the question o the weight of cement he believed that i the original Report of the R.I.B.A. Sub Committee on Reinforced Concrete the weigh was specified 76 lb. per cubic foot, and th tests in the tables referred to were mad under the same conditions, and since ther the 90 lb. had been adopted. The questio of the weight or measure of cement was fa from satisfactory, however, and, as Mr. Frase had said, they always adopted a method o testing the weight of cement per cubic foot and they would see at the bottom of one o the tables the extraordinary results they obtained. They so increased their cubi measure as to accommodate not less than 90 lb It was a fairer way both to the contractor an to the client, and it certainly got rid o carelessness on the part of workmen i throwing aggregate into the scales. There was enormously hard wear on any form o weighing machine; the scales must be out o truth within two or three days of their use The only real test on the job was a test o the structure, and that he was dead against unless they could load to the superimposed load for which the structure was designed and he hoped that when the L.C.C. regula tions came into force that some of the work which would be subjected to a test of 1 would collapse (without loss of life), because in his opinion it was asking for trouble, an weakened the structure. He was glad t hear that Mr. Bylander did not agree wit the 4 by 4 cube for testing. It was no sufficiently large for testing with th aggregate they were using, namely, ¾ in The reason he advocated a 6 cube was tha it was not better made and was more of a shape which was adopted in work generally and with a circular column they were all th time tending to get a very much better an consolidated mixture than they did with th square one, because in the former they coul ram so much better than with the latter, an with the square one they could not get art ficial results. With a 6 by 6 by 12 a double quantity of material would be required, an on a big job the cost of material submitte for testing was quite considerable. He di not think a 6 by 6 by 12 would serv any further purpose than a 6 cube. Th former was apt to bind the material fo perhaps one hundredth part of a second longe than the latter, which was quite large enough to give them results which they coul

reasonably expect to get in a job. Mr. lander had asked why he limited the ngth of steel to 72,000 lb. His answer s that if they got it above that there uld be a tendency to increase the carbon. hey increased the strength of steel beyond 000 lb. there was a tendency eventually increase the safe load. It was impossible, thought, to increase the basis of 60,000, and gave the rolling mills a range of 12,000 lb., ich was ample. If they allowed them a nter range than that it opened up the ssibility of makers using a foreign loom, ereas with British steel they had a better ance of getting evenness of the metal. ir Chairman had spoken of the financial nt of view, and he, the speaker, could ure them that reinforced concrete would er have been used in England by industrial is if the financial question had not entered it to a very large extent. Flat roofs e infinitely cheaper and floors of reasonable n could always be done cheaper in re-rced concrete than in steel or wood. linary ship sheds were cheaper, and the ole matter was a question of proper ign. A beam 18 in. by 18 in. was probably most uneconomical section one could have reinforced concrete. A 9 by 20 or 9 by would probably give the same strength h much less material, and the 2 in. metal mentioned did not seem very essive. Architects' supervision was a very point. Reinforced concrete was work ich should be done properly or not at all. personally never employed a clerk of rks, but sent out trained assistants who erintended the work with the help of an pector. By such means they got infinitely ter results; their clients paid their assistants inspectors while on the job, and it got over the difficulties of supervision. After all, architect was only responsible for reason-e care and attention, and he had never n a job where the architect had given sonable care and attention come to any m.

RCHITECTURAL SOCIETIES.

Nottingham Architectural Society.

hrough the kind invitation of Mr. Arthur rshall, A.R.I.B.A., the members of the hitectural Society had the opportunity on rch 14 of inspecting the New Eye irmary on the Ropewalk, Nottingham. he premises have cost nearly 10,000*l.* e irregular site upon which the Infirmary nds, with a fall of 18 ft., presented con-erable difficulties in planning, but these e been most satisfactorily overcome. The ge out-patient department is entered on lower level from Oxford-street. A step-entrance leads into the waiting-hall, ich is capable of accommodating about , and is fitted with specially-designed seats. A little marble fountain is built the wall at one end. Two doors lead ectly from this hall into the large con-ing-room, an apartment equipped with k-rooms, microscopic-room, and a dis-sary, by which the patients pass out after mination or treatment. he service entrance is also approached m Oxford-street, where a special yard is vided for the delivery of coals, food supply, ndry, etc., and where the general business uirements of the Institution are attended The kitchen, scullery, larders, meat-e, etc., are adjacent to the service en-nce. The former is a model of equipment cooking for a considerable number, gas ng used. A food lift commences in the very, and communicates with each floor. e committee-room is on this floor also. he whole of the Ropewalk level is taken by in-patients and casualty departments. s divided into male and female sections, h having two wards for eight and six beds pectively. The main entrance opens into ainscoted hall, which is fitted with seats the requirements of a small casualty-n, for here minor accidents to the eye attended to. The two female wards ch open out of this are capable of being tionally darkened by a system of blinds shutters, features to which very careful sideration has been given. The colouring he wards, and the glass, which is green, such as will prove most restful and quiet he eyes.

A central corridor leads direct to the male wards, and midway between, on the north side, are the operating, sterilising, and clinical rooms. The walls of the former are black.

The dayrooms are designed to be utilised as open-air balconies; by a system of patent sliding windows the whole room can in a few seconds be converted into a sun balcony. Each ward is fitted with a glow-light for night use on a new system, by means of which one switch only is used for giving a light of varying degrees of strength from the faintest glow to the full strength. The roofs, which are flat and covered with Val de Travers asphalt, are utilised as airing-courts for males and females, and shelters are provided for each.

The whole of the staff is accommodated on the floor above the wards. There are a servery or kitchen, nurses' dining and sitting room, matron's sitting-room, and nurses' and servants' bedrooms, each with their separate bathrooms, lavatories, and conveniences. This floor is so constructed that, in the event of an extension of accommodation being required, an additional story may be built without interfering with the working of the Institution.

The entire structure is fireproof, the floors and roofs all being of reinforced concrete. Each ward has its own sanitary annexe and fire-escape staircase. All soil pipes are lined with glass, and all drains are in cast-iron with porcelain lining. No earthenware pipes are used. A boiler in the basement supplies 176 gallons of water per hour at 160° Fahr. The building is heated with low-pressure hot water by radiators of a special hospital pattern devised by the architect.

The entire work has been carried out under the personal supervision of the architect, Mr. Arthur Marshall, A.R.I.B.A.

At the conclusion of the visit Mr. Sutton, Vice-President, conveyed the thanks of those present to Mr. Marshall for so kindly taking them round.

Northern Architectural Association.

The annual general meeting of the Northern Architectural Association was held at the offices in Higham-place, Newcastle, recently, Mr. H. C. Charlewood, F.R.I.B.A., President, occupying the chair.

In their report the Council expressed regret that the depression in the building and allied trades continues. The membership was 224 as compared with 233 last year, the decrease being chiefly in the class of Associates. Mr. F. W. Rich and Mr. J. Oswald had been appointed to attend meetings of the Sub-Committees of the Corporation formed for the purposes of Part II. of the House and Town Planning Act. The Council recorded with regret that it had not been possible to arrange for the exhibition of the designs and drawings in connexion with the Royal Institute competitions in March, as usual. Arrangements had, however, been made to hold the exhibition during the week commencing June 10. The Council had made representations to the Royal Institute suggesting that the appointments of clerks of works should in future be made by the architects.

Prizes had been awarded as follows:—Measured drawings (age limit, twenty-five), Mr. W. Holden; (age limit, twenty-one), Mr. H. St. J. Harrison; architectural sketches (age limit, twenty-five), Mr. S. W. Milburn; (age limit, twenty-one), Mr. H. St. J. Harrison; Glover studentship, Mr. A. E. Lowes; design for a pavilion to be erected in an Italian garden in England, Mr. M. K. Glass and Mr. K. Glover. Some of the drawings submitted were well worthy of reproduction.

The General Fund opened with a balance of 29*l.* 7*s.* 9*d.* and closed with a balance in hand of 53*l.* 1*s.* 9*d.*

On the motion of Mr. G. T. Brown, F.R.I.B.A., the report and accounts were adopted as eminently satisfactory.

Prizes were presented to successful students by the President.

The following nominations for officers and Council have been received for the ensuing session, and the gentlemen named will be declared duly elected to the respective offices for which they have been nominated:—President, Mr. Wm. Milburn; Vice-President, Mr. R. Burns Dick; Hon. Treasurer, Mr. J. T. Cackett; Hon. Secretary, Mr. C. S. Errington; Hon. Librarian, Mr. J. Bruce, Assistant Hon. Secretary, Mr. C. I. Greenhow; Council: Mr. G. T. Brown, Mr. H. C. Charlewood, Mr. F. E. Dotchin, Mr. W. T. Jones, Mr. J. Oswald, Mr. A. B. Plummer, Mr. F. W. Rich, Mr. A. K. Tasker, Mr. J. W. Taylor, Mr. C. Walker, Mr. W. H. Wood, Mr. S. Ash, Mr. M. G. Martinson, Mr. H. A. Wilson, Mr. J. Hall, Hon. Local Secretary for Sunderland; Mr. J. H. Morton, Hon. Local Secretary for South Shields; Mr. W. J. Moscrop, Hon. Local Secretary for Darlington.

The new President (Mr. William Milburn) having been installed, spoke in acknowledgment, saying that if he handed the chair of office to his successor with the Association in the same healthy condition as it was at the close of the second term of Mr. Charlewood's service he should be delighted. He moved a vote of thanks to Mr. Charlewood for his devoted work.

Mr. R. Burns Dick (Vice-President) also spoke, and the thanks were heartily accorded to the retired President.

The Hon. Secretary (Mr. C. S. Errington) was also complimented upon his work and thanked.

Birmingham Architectural Society.

In connexion with the Birmingham Architectural Association, Mr. Lawrence Weaver lecture on the 21st inst. on "The Development of the Renaissance in Scotland." Mr. C. Bateman presided. Mr. Weaver pointed out that, although most learned works had been written on the baronial buildings of Scotland, no attention had been given to the later work that coincided in date and general treatment with that of Sir Christopher Wren and his followers in England. It was notable that the first impact of the reborn classical taste reached Scotland direct from France, whereas England owed it to an Italian first, and later to Germans and Flemings. At Falkland Palace and Stirling Castle the first evidences of the new manner were to be seen. Sir William Bruce, the architect of the additions made to Holyrood Palace in 1671, was to be regarded as the Scottish Wren, though he fell far behind Wren in personal genius. Still, he was the man who established the full Palladian manner in Scotland, and he was ably followed by William Adam, the father of the famous Brothers Adam.

Leicester Architectural Students.

On Tuesday evening, March 26, Mr. S. Perkins Pick, F.R.I.B.A., gave his ninth annual criticism of the works executed during the session by the students attending the classes in architecture and building construction.

The classes have been conducted on "the principle that construction is the basis of architecture, and its correlative principle that architecture is the interpretation of construction into forms of æsthetic value."

Mr. Pick adjudicated the drawings submitted for the David M. Nesbit prizes, value 10*l.* Mr. Nesbit, a former student, was also present, and made an encouraging speech to the students.

On the proposition of Mr. Fletcher votes of thanks were accorded to Mr. Pick and to Mr. Nesbit.

Architectural Association of Ireland.

A general meeting of this Society was held on the 19th inst., at eight o'clock, in the Lecture Hall, 15, South Frederick-lane. The President, Mr. Page L. Dickenson, M.R.I.A.I., occupied the chair.

The minutes of the last general meeting having been read and signed, Professor C. H. Reilly, M.A., of the Liverpool University, read a paper on "The Monumental Qualities in Architecture," which was illustrated by numerous lantern slides of the principal buildings of ancient Greece and Rome, and also of many modern buildings in America. Professor Reilly made a strong point of the absolute necessity of taking a broad view of all architectural problems, and attributed the success and beauty of the Dublin Custom House to the cultured and broad outlook on life which Gandon, the architect of this building, possessed. During the course of his paper Professor Reilly defined the monumental quality in architecture as composed of four constituents, viz., unity, mass, scale, and refinement; this definition was shown to be very comprehensive by illustrations of Roman and Greek buildings of monumental character which possessed

these four qualities. At the conclusion of Professor Reilly's paper a vote of thanks was proposed by Mr. Albert E. Murray, President of the Royal Institute of the Architects of Ireland, seconded by Professor W. A. Scott, M.R.I.A.I., and supported by Mr. R. M. Butler, M.R.I.A.I., Mr. R. O'Brien Smyth, M.R.I.A.I., and Mr. Connor O'Brien, M.R.I.A.I.

The Guild of Architects' Assistants: Scale of Salaries.

From the Annual Report of the Guild of Architects' Assistants, one of the objects of which is to secure a recognised scale of salaries for Architects' Assistants, we take the following, adopted by the Council on December 17, 1911 :—

"One hundred cases, gathered from London and the provinces, of conditions of the employment of Architects' Assistants have been examined by us, and from them we arrive at the following facts :—

1. The present average salary

	s. d.
At the ages of 19 to 21 is	21 0 per week.
,, ,, 21 ,, 25 ,,	31 0 ,, ,,
,, ,, 25 ,, 30 ,,	49 3 ,, ,,
,, ,, 30 ,, 40 ,,	61 8 ,, ,,
,, ,, 40 and over	65 0 ,, ,,

2. We find no difference between assistants possessing examination qualifications and those without them. This position is corroborated by the statement of Professor Reginald Blomfield in his notes on the recent changes in the R.I.B.A. examinations :—"In the opinion of many competent authorities, the standard hitherto reached in the R.I.B.A. Examinations has been lower than it should have been."

3. Age and experience are uniformly inseparable, their averages being constant. In addition, the definition of "experience" involves the difficulty of distinguishing between the experience of a pupil and that of a scholar from a technical institution.

4. We therefore adopt age as the sole standard, other conditions as to personal character and work remaining equal.

5. Exceptional men and exceptional work will always find exceptional markets, and therefore are absolutely excluded from our consideration, dealing as we do with the normal, unexceptional assistant.

6. We desire to record our strenuous opposition to the existence of unpaid assistants, other than duly articled pupils.

7. The scale of minimum salaries for a week of thirty-nine working hours which we propose is as follows :—

	Age.	Salary.
Improvers ..	19 to 21.....	25s. per week.
Assistants .	21 ,, 25	35s. ,, ,,
,, .	25 ,, 30 ..	50s. ,, ,,
,, .	30 ,, 40	65s. ,, ,,
,,	40 and over .	70s. ,, ,,

Deduced, as these salaries are, from current rates, we regard assistants below twenty-five years of age to be excessively badly paid at present, and some of the minimum salaries throughout are remarkably low. We regard 35s. as a necessary minimum for the age of twenty-one in comparison with the wage paid in almost any trade. In conclusion, none of these proposed figures are in any way absurd or chimerical; they are paid by many principals, and we are actuated only by the desire to bring the current rates of assistants' salaries to those paid by the average conscientious practitioner."

GENERAL NEWS.

Good Friday Week.

In consequence of the Easter Holidays, we go to press a day earlier than usual next week, the *Builder* being published on Thursday. All communications must reach the Editor by first post on Wednesday morning.

Professional Announcements.

The address of Mr. Percy J. Westwood, A.R.I.B.A., is now 7, Adam-street, Adelphi, W.C. His telephone number will remain the same—1217 City.

Mr. Sydney Jeffree, F.S.I., has changed his address to 27, Chancery lane (17, Lower Ground Floor).

Mr. Alfred Cox, F.R.I.B.A., has removed his offices from 4, Adam-street, Adelphi, W.C., to 34, Henrietta-street, Covent Garden.

Messrs. Gale, Durlacher, & Emmett, architects and surveyors, have removed their offices from No. 33, New Bridge-street, Ludgate-circus, to No. 15, New Bridge-street (opposite). Their telephone number will in future be City 6888, and telegraphic address, "Galdono, London," as hitherto.

King Edward Memorials.

At a meeting of the executive committee of the King Edward Memorial Fund on March 7 at the Mansion House, under the presidency of Sir Vezey Strong, the Chairman, it was announced that the fund now amounts to about 68,000*l.*, and that, 20,000*l.* being allocated to the statue in Green Park, a sum of 48,000*l.* is available towards the cost of the proposed Shadwell riverside park, for which a further sum of 5,000*l.* is offered by the Reginald Poulter Trust: it is suggested that an acre be added to the site by taking in the foreshore to low-water mark.

The Theosophical Society's New Buildings.

For the erection of the Society's buildings, at an estimated cost of about 40,000*l.*, after designs prepared by Mr. E. L. Lutyens, on the site near the north-eastern corner of Tavistock-square, a lease for 200 years has been granted by the Duke of Bedford of the land which abutted, eastwards, upon the west side of Burton street, by Tavistock House. The St. Pancras Borough Council have resolved to support the Society's application to the magistrates for a closing of the *culs-de-sac* in both directions, which have hitherto existed by reason of the garden ground between Burton-street and Upper Woburn-place, Tavistock-square.

New Government Buildings.

The offices of the Crown Agent for the Colonies, at present situated in Whitehall-gardens, will be removed eventually to a new building. The site virtually decided upon, subject to the approval of the Secretary of State for the Colonies, is in Millbank, near the offices of the Ecclesiastical Commissioners. Mr. J. W. Simpson, F.R.I.B.A., is preparing plans.

Art Museums and Picture Galleries.

Mr. Edwin T. Hall will read a paper on "Art Museums and Picture Galleries" at the general meeting of the R.I.B.A. fixed for April 1. The illustrations will include a fine collection of slides specially prepared for the paper. Mr. Hall's paper is in substitution of that on "Modern Methods of Construction," which Mr. Dunn is unable to read

Charing Cross Tube Station.

The Playgoers' Club has just removed from Clement's Inn into the premises erected over the station, where they will occupy the upper three floors. The dining-room, lounge, and reading-room are on the fourth floor; on the fifth floor are the billiard-room, card-room, and Secretary's office, and above are the kitchen and Steward's quarters. A reference and lending library and theatrical museum will be shortly opened.

Jewish Memorial to King Edward VII.

The memorial to King Edward VII. in Mile End-road, opposite the London Hospital, was unveiled on March 14. The fountain, designed by Mr. W. S. Frith, embodies a stone column carrying a bronze figure of Peace, with bronze groups of Liberty and Justice, and a medallion portrait of the King. The memorial has been erected at a cost of more than 800*l.*, subscribed by all classes of the Jewish community.

New Telephone Exchanges, London.

Three new telephone exchanges will shortly be provided in London. They will be opened in Clerkenwell, to relieve the London-wall and Central exchanges; in Tottenham Court-road, to be known as the Museum Exchange, in relief of the Gerrard, Central, and Mayfair exchanges; and at Notting Hill-gate, to be known as the Park Exchange, in relief of the Mayfair and Western exchanges.

International Gas Exhibition, Amsterdam.

An exhibition of applications, instruments, and appliances using gas for lighting, heating, industrial, and scientifical purposes will be held on September 14 to October 6 in the Paleis voor Volksvlijt, Amsterdam. The manager of the municipal gasworks will organise the Exhibition; the address of the Committee of Management is 29A, Amstel, Amsterdam.

Statue of Bacon for Gray's Inn.

Mr. F. W. Pomeroy, A.R.A., is the sculpt of the bronze statue of Sir Francis Bac that will be set up in June in South-squar Gray's Inn. The design embodies a Renai sance pedestal, 6 ft. high, supporting figure of the Chancellor in his robes and hol ing the Great Seal, in its case, the costum being in accordance with that of the seate effigy in St. Michael's at St. Albans an portraits preserved in the Inn.

French School of Archæology in Athens.

M. Homolle, member of the Institute France, has been appointed a Director the French School of Archæology, at Athen for a term of six years, *vice* M. Hoklea resigned. M. Homolle thus resumes a pos tion he formerly occupied until he wa appointed Director of the Louvre.

The Church Building Society.

The Incorporated Church Building Societ held its usual monthly meeting on the 21s inst. at the Society's House, 7, Dean's yar Westminster Abbey, S.W., the Rev. Cano C. F. Norman in the chair. Grants of mone were made in aid of the following objects, viz building new churches at South Norton, St Michael and All Angels, Co. Durham, 100*l.* Dawdon, St. Hilda and St. Helen, Co Durham, 185*l.*; Goodmayes, St. Paul, Essex 120*l.*; and Goole, St. Paul, Yorks, 125*l.* rebuilding the Church of St. George, Leicester 150*l.*; and towards enlarging or otherwis improving the accommodation in the churche at Charlestown, St. Thomas, near Halifax 20*l.*; Norbury, St. Stephen, Surrey, 50*l.*; Ry Harbour, The Holy Spirit, Sussex, 50*l.*; an Walton-on-the-Hill, St. Mary, Lancs, 120 Grants were also made from the Specia Mission Buildings Fund towards buildin mission churches at Manningham, St. Luke near Bradford, 50*l.*; and Ynismeudw, St Mary, Glam, 50*l.* The following grant were also paid for works completed :—West cliff on-Sea, St. Saviour, Essex, 100*l.*; Soutl Wimbledon, St. Peter, Surrey, 150*l.*; Grange town, St. Aidan, near Sunderland, 100*l.* Pembrey, St. Illtyd, Carmarthenshire, 80*l.* Holmer, St. Mary, near Hereford, 25*l.*; an Caergeiliog, St. David, near Holyhead, 40 In addition to this the sum of 320*l.* was paid towards the repairs of thirty-one churche from Trust Funds held by the Society.

Civil Service Estimates: Public Works and Buildings.

Class I. of the Estimates, for public works and buildings, shows that for the current year 3,638,080*l.* will be required, being a ne increase of 171,384*l.*, as compared with the amount, 3,466,696*l.*, for 1911-2. There ar items of 71,300*l.* (a decrease of 4,400*l.*) fo the Royal Palaces; 50,800*l.* (a decrease o 3,370*l.*) for the Parliament Buildings; 125,700*l.* (a decrease of 7,833*l.*) for Royal parks and pleasure gardens; and 215,300*l.* (an increase of 75,300*l.*) for Labour Exchange and Insurance buildings. Up to the end of last year 41,649*l.* was expended upon the hire of Labour Exchange buildings, and 9,537*l.* was spent upon purchase of premises.

The Old Chapter Library, St. George's Chapel, Windsor.

In the course of some alterations of the interior of the office of the Chapter Clerk, which was originally part of the library of the Dean and Canons in the Dean's Cloisters, have just been discovered the panel-work of the ceiling, which at one time formed the canopy of the entire library. The panels, of oak, have bosses delicately carved. The central boss, in form of a chalice upon an altar, bears the letters "T. B.," which, it is supposed, are the initials of Thomas Brode, who was Canon and Treasurer of St. George's Chapel in 1490 3. The Chapter records evince that the building was begun in 1483. Other bosses present cognisances of the Royal House of York, one consisting of the sun shining in glory at the back of a shield charged with a pierced heart and surrounded with a crown of thorns. Embedded in the wall, to the north-east, has been found a window with oaken framework of ten lights.

Duke of York's School Buildings, Chelsea.

At an outlay of nearly 30,000*l.*, the buildings vacated by the Duke of York's School have been adapted for the Headquarters of the County of London Territorial Association, and will so provide for a force of 5,000 men. The top floor

f the main building is reconstructed to fford eighteen complete and self-contained uarters for the permanent staff; on the econd floor are the offices of the Associa- on; the London Irish are quartered on the rst floor, and the Army Service Corps are n the ground floor. There are two riding chools, stabling for thirty horses, six rifle anges, a large restaurant, recreation-rooms, wimming-bath, etc. Each regiment has its wn messing quarters and canteen. The nedical units will be housed in the left wing, hich is now being remodelled for their use.

Street Improvements, Hendon, N.W.

Major J. Stewart, R.E., one of the In- pectors of the Local Government Board, eld an inquiry on the 26th inst. at the rban District Council offices into the ouncil's application to construct kerbing, hannelling, and paving works in Golder's reen-road, etc., from the London County ouncil boundary at Hampstead to Hendon. Ir. S. Slater Grimley, M.Inst.C.E., the ouncil's Engineer, gave evidence in upport, and stated that the distance overed by the proposed improvement as about two miles, his estimate being 0,835*l*. The proposed expenditure was rimarily due to the large building develop- ents which have taken place in the district, articularly since the opening of the Golder's reen Station of the Hampstead Tube Rail- ay. The latter railway is about to be xtended to old Hendon, and then, no doubt, is picturesque suburb of London will grow ven more rapidly, the want of railway cilities with London being greatly felt in ie past.

The Late Mr. G. E. Pritchett, F.S.A.

In the course of next June will be sold by uction the collection formed by the late Ir. G. E. Pritchett, of Oak Hall, Bishop's tortford, architect. The collection includes ak panelling, old Spanish leatherwork, rints, engravings, etc., and examples of acobean, William and Mary, Queen Anne, nd Chippendale furniture. An obituary otice of Mr. Pritchett appeared in our sue of March 8.

Bombay and the Durbar.

The Government of India have agreed to ontribute one-fourth, and the Bombay overnment will subscribe 20,000*l*., towards he estimated cost, 800,000 rupees (53,333*l*.), f carrying out in white marble the designs, fter the Saracenic manner, of the temporary avilion which was erected on the Apollo Bunder, Bombay, for the landing of King eorge V. upon the occasion of his recent isit to India. The King, it is stated, has xpressed a wish that his entry into India, nd the previous Royal associations of the Apollo Bunder, should be commemorated ith a building worthy to symbolise the Gate f India.

CORRESPONDENCE.

Practical Patriotism.

SIR,—The unparalleled confusion in in- ustry brought about by the coal strike leads s to point out two pieces of practical atriotism which, if generally followed at nce and for the immediate future, would o much to mitigate the after effects of this isaster. As a firm employing thousands of en, we view with anxiety the inability o railway companies to transport our stone and ranite products from the quarries—many f them inland to their destinations. All ailway companies have issued notices in- olving the total cessation of such traffic till he conclusion of the strike. This places us t a disadvantage with foreign competitors, who, in foreign vessels with foreign coal, an ship to a British port giving the shortest ossible land journey to site, and can supply aterials for the completion of contracts for hich, through no fault of our own, our aterials are not at present available.

As this difficulty is shared, we believe, by large number of British firms supplying ll sorts of building and engineering aterials, we venture to urge on all archi- ects, surveyors, engineers, and builders that, s far as possible, except in the case of bsolutely necessarily urgent work, an agree- ent be made to waive the time clauses of ontracts, as far as is reasonably possible, in rder to preserve as much work as possible or British firms and British workmen when he crisis is over.

The abnormal conditions also warrant us in urging that, during the period of depression which must follow the present crisis, the Government departments, also public bodies, such as municipal corporations, as well as architects, surveyors, and engineers, stipulate that, so far as possible, British materials only be used in work under their control until normal trade is again obtained. A system of voluntary patriotic action of this nature is sure to find favour at the present time among responsible persons of every shade of political thought, and we therefore venture to make these two suggestions.

UNITED STONE FIRMS, LTD.
(WALTER BRYANT, General Manager).

The East Sussex Hospital Competition.

The following letter has been addressed to the Chairman and members of the East Sussex Hospital Committee, Hastings, by Mr. William Henman, from whom we have received a copy:—

GENTLEMEN,—Trusting that past experience with the existing hospital would compel every precaution being taken to secure a design which would meet modern hospital requirements in a practical and sanitary manner, I ventured to apply experience, gained during the last thirty years, in the design and construction of a number of provincial hospitals, to solving the somewhat intricate problem of planning a hospital to detailed requirements on a difficult site.

Realising that others capable as myself would be competing, I was prepared to accept the decision which presumably was acquiesced in by your assessor, until I had the opportunity to-day of examining the selected plans published in the *Builder*. So faulty are they in so many and important particulars that, in the interests of the undertaking, I respectfully submit it would be advisable, before instructions are given for carrying them into execution, that the following questions should receive most careful consideration:—

1. Did not the conditions properly limit the height of pavilions to two stories?

2. Are the gradients of roadway to the casualty and in-patients' entrance and to the main entrance to administration building practicable?

3. Is it a satisfactory arrangement to have the casualty department and in-patients' receiving-room so far from the out-patients' department? In provincial hospitals new patients frequently mistake one for the other, and it is not an unusual occurrence for some to wait for hours in the wrong place without receiving attention, when one department is away from the other.

4. Are the casualty and in-patients' receiving-rooms arranged so that patients on ambulance waggons or stretchers can conveniently be received or transferred to the wards?

5. How could a patient be conveniently conveyed on ambulance, trolley, or stretcher from the out-patients' department to the wards? Such occasionally becomes necessary.

6. Where are baths, lavatories, and water-closets, sinks, etc., for the two eye wards, and for the four and two bed, surgical and medical, male and female wards?

7. Where is bath accommodation for gynæcological ward?

8. Where is bath accommodation for two isolation wards?

9. How can patients on ambulance trolleys or stretchers be conveyed into the two and four bed wards?

10. Is it advisable that staircases should give air communication between the two and three stories of main pavilions?

11. Where are the cleaners' and trolley rooms to any of the five floors of wards?

12. What is the practical utility in providing external stairways for escape in case of emergency if it is impossible to convey patients in beds or on stretchers to and down same?

13. How is the out-patients' department to be economically supplied with hot water and heating with the boilers at a considerably higher level?

14. How can foul linen from the wards, etc., be conveniently conveyed to the disinfector and thence to the laundry? Or even to the laundry direct from the wards, except past kitchen and store-rooms?

15. Is it convenient when medicines are required for the wards from the dispensary that they should have to be conveyed up a stairway and a considerable distance along a corridor to the lift, and then, for most of the wards, again along a corridor?

16. Is it a sanitary arrangement that foul water from the operating department should have to be discharged into the small areas, three stories deep, near the kitchen department, and thence to be conveyed under the buildings?

17. How can foul water and rain water, as well as snow occasionally, otherwise be removed from these small areas, the depth of three stories?

18. Is it desirable that house coal should be shot down in a narrow passage close to kitchen entrance off an enclosed yard, too small in which to turn a cart round?

19. Is the provision for getting in coal for boilers practicable?

20. Is it good to shut out sunlight by wide balconies at ends of wards and to have the sides of wards overshadowed by projecting sanitary turrets?

21. Is it advisable that tradesmen and stores should enter close to the mortuary and out-patients' department?

22. Is the isolation block conveniently placed for supplying meals? How would patients be conveyed there? And how would they be visited by medical men, particularly in the event of the additional pavilion being erected?

23. Will the ophthalmic surgeon consider it a convenient arrangement that he will have to traverse 250 ft. of corridor to get from three male to three female patients?

24. How is a corpse to be conveniently transferred from a ward to the mortuary?

25. Is the requirement reasonably fulfilled that the hospital should be designed so that portions can be erected as funds permit?

The foregoing questions imply serious faults in planning which appear in the selected design, not one of which, I can confidently state, is to be found in the design I had the honour of submitting, and I doubt if many other designs so flagrantly disregard undoubted essentials in hospital planning.

Whatever may be the result of investigation on the above points, I trust it may, at least, prevent heavy expenditure on faulty lines.

WILLIAM HENMAN, F.R.I.B.A.

Stafford and Portland Competitions.

SIR,—We learn that the competition now advertised at Portland is for Council offices, to cost 4,000*l*. This is the same figure for which the Stafford Library is to be erected. Are we to see again a scramble of 200 men for 200*l*.? Are competitions such as these likely to enhance the dignity of the profession?

We understand the President of the Institute is to be asked to appoint an assessor, and to confer his official sanction on this exploitation of the profession.

Cannot some limitation, either by district or otherwise, be insisted on? Open competitions such as these not only result in monetary loss to the profession as a whole many times more than the fees accruing, but serve to lower the value of architects' services in the eyes of the public, and so the loss is unqualified.

D.

Combined Heating and Power Plant.

SIR,—We think your correspondent Mr. S. Whitmore Robinson must have been misled by your summary of Professor R. J. Durley's paper on the combined centralised heating and electrical installation at the McGill University, Montreal, Canada.

Had he heard the paper read he would have understood that no reflection was intended on English architects and engineers, but that it was simply a description of the system as applied to the institute in question.

An application of the system was installed by ourselves at the Camberwell Infirmary, London, under the instructions and supervision of Mr. Edwin T. Hall, F.R.I.B.A.

For DARGUE, GRIFFITHS, & CO., LTD.,
J. ALFRED DARGUE.

INTERCOMMUNICATION COLUMN.

Plaster Painted Dado.

SIR,—Could you tell me which is the correct way to lay off a plain plaster painted dado on staircase 2 ft. 4 in. high, whether up and down or long way? W. J. SHARP.

BOOKS RECEIVED.

THE WORKS OF MAN. By Lisle March Phillips. (London: Duckworth & Co. 7s. 6d. net.)

HOUSING AND TOWN PLANNING CONFERENCE, 1911. (London: E. & F. N. Spon, Ltd. 10s. 6d. net.)

EDITORIAL SUMMARY.

"A Lesson from America" is the title of the leading article, in which reference is made to the recent Architectural Association discussion on the subject.

An article on the King Edward Memorial appears on p. 350.

In "Notes" columns (p. 351) will be found comments on: "Forest Fire Prevention"; "Ancient Villages in Lake Gatun"; "The Building and Cost of Manchester Schools"; "The Newest Responsibility of Architects"; "Up-to-Date Bruges."

Some art exhibitions are noticed on p. 352.

A meeting of the Architectural Association was held on Monday, when Mr. C. A. Voysey and Mr. Arthur Keen read papers on "Patriotism in Architecture" (p. 352).

The Ninth Carpenters' Hall lecture on the "Arts Connected with Building" was delivered on Wednesday last week by Mr. W. R. Hoare, whose subject was "The Craft of the Brick and Tile Maker" (p. 356).

A report of the International Smoke Abatement Exhibition is given on p. 357.

On p. 359 we give the second part of the paper by Mr. Alban H. Scott, on the "Testing of Materials Used in Reinforced Concrete," read before the Society of Architects, together with some notes on the discussion which followed.

Our reports of "Architectural Societies" (p. 361) include: "Northern Architectural Association"; "Architectural Association of Ireland"; "The Guild of Architects' Assistants"; "Nottingham Architectural Society."

In Correspondence columns (p. 363) will be found letters on: "Stafford and Portland Competitions"; "Practical Patriotism"; "The East Sussex Hospital Competition."

A report of the fifth spring visit of the Architectural Association, to the new buildings of King's College Hospital, Denmark Hill, is given on this page.

An illustrated article on the work of Mr. Arnold Mitchell is given on p. 365 under the heading of "Contemporary Architects and their Work."

The Building Trade Section (p. 370) includes: "The Right to Work"; "The Institute of Builders"; "The Institute of British Decorators"; "The Builders' Clerks' Benevolent Institution"; "Projected New Buildings in the Provinces"; "Applications under the London Building Acts," etc.

A third article on the "London Opera House," with illustrations, is given on p. 374.

An illustrated article on "Reinforced Concrete in Great Britain" is given on p. 375.

MEETINGS.

FRIDAY, MARCH 29.

Glasgow Architectural Craftsmen's Society (The Technical College).—Business meeting. 7.45 p.m.

SATURDAY, MARCH 30.

The Royal Institution.—Professor Sir. J. J. Thomson, M.A., LL.D., D.Sc., F.R.S., on "Molecular Physics"—VI. 3 p.m.

MONDAY, APRIL 1.

Royal Institute of British Architects.—Mr. Edwin T. Hall on "Art Museums and Public Galleries." 8 p.m.

The Society of Engineers.—Mr. Gerald O. Case on "Liguo-Concrete." 7.30 p.m.

Royal Society of Arts.—Mr. Noel Heaton, B.Sc., F.C.S., on "Materials and Methods of Decorative Painting"—III. 8 p.m.

Liverpool Architectural Society.—Annual general meeting. 6 p.m.

TUESDAY, APRIL 2.

Institution of Civil Engineers.—Paper on "The Works for the Supply of Water to the City of Birmingham from Mid-Wales," by Messrs. L. Mansergh and W. L. Mansergh, MM.Inst.C.E. 8 p.m.

WEDNESDAY, APRIL 3.

The Institution of Municipal Engineers.—Mr. Sidney Palmer on "The Design and Planning of Working-Class Dwellings." 7 p.m.

Edinburgh Architectural Association.—Associates' meeting. 8 p.m.

THE ARCHITECTURAL ASSOCIATION:

FIFTH SPRING VISIT.

THE new buildings of King's College Hospital at Denmark-hill were visited by the Architectural Association on March 16, precisely two years after the previous visit. In the interval great progress has been made, though much yet remains to be done before the hospital can be opened. The general plan, which has been scarcely varied from the competition scheme, was fully described in the report of that visit, but may be briefly outlined as a main "backbone" corridor running east and west lengthwise of the site, with nine ward pavilions southward of this, overlooking Ruskin Park, and various administrative, educational, and special buildings northward of the same corridor next Bessemer-road; the Outpatients', Casualty, Bathing, and other departments, necessarily within easy reach from outside, occupying the angle nearest to Denmark-hill. An important influence on the formation of the scheme was exerted by the rise of about 15 ft. in the level of the site from north to south, which places the ground floor of the ward pavilions on a level with the first floor of the Administrative buildings. The visit of inspection was chiefly confined to the Administrative Block and Ward Pavilions, which two years ago had only been commenced. The former is now structurally complete. It is six stories in height, the whole of the upper portion above the first floor being devoted to the Nurses' Home and Servants' Department, each self-contained. The building consists of a front block parallel with Bessemer-road, with three wings running southward at right angles, the outer wings accommodating nurses' bedrooms, and the central one servants'; nurses' sitting-rooms are arranged facing the road. Each bedroom is generally similar and contains a built-up wardrobe of the same material as the partitions. All angles are rounded, and a hollow skirting of granolithic is formed at the floor level, slightly raised to finish flush with the floor, which will be of linoleum laid direct on cement. No heating is provided in the rooms, all the necessary radiation being in the corridors, whence it is admitted by opening fanlights, but each room is provided with an extract flue carried up to the top of the building. The present accommodation is for 200 nurses, but the west wing (as yet unbuilt) will extend this to a total of 300. The Nurses' Dining Hall, seating 150, is a fine room on the ground floor, served directly from the main kitchen, which is in the basement between the east and centre wings of the Administrative Block, the various stores being also situated here, readily approached from a sloping roadway for goods delivery.

The public parts of the Administrative Block, comprising offices, boardroom, etc., are well grouped around a charmingly designed central hall, two stories in height, from which groined corridors radiate. In the rear of the Administrative Block, at the intersection of the cross axes of the whole institution, the chapel is in course of construction. This projects between the two central pavilions, approached by a low vaulted cloister, and is a lofty building with aisles separated by reinforced concrete piers or stanchions, which rather curiously change above springers into steel lattice-framed trusses for the vaulted ceiling. Beyond the chapel at a lower level is the central power-station and shaft. Three Lancashire boilers 30 ft. long will be installed, but Diesel oil engines will be used for driving the electric dynamos.

Six ward blocks of the ultimate nine are now in course of construction, with accommodation for 372 beds, the two central pavilions, three stories high, being already in carcase. The remainder will be of only two stories. All are similar in plan and comprise a day-room for patients and a sister's room next the "backbone" corridor, with an octagonal "blow-through" lobby interposed between these rooms and the rest. Next are two single-bed wards, duty-room, larder, linen, and clinic, and the main twenty-four-bed wards, with sun-balconies their south ends between sanitary towe projected at oblique angles. The wards w contain several novel features in design a construction. Midway in their length small octagonal bay projecting on each si will contain lavatories for the medic officers' use. The sashes, of a very ingenio yet simple design known as the "Austral upon the improvement of which a great de of though has been expended by the architec will be fixed almost flush with the intern wall face, avoiding window-ledges. Evei hospital architect knows the unfortuna complications of heating and other pipe which tend to disfigure his wards and gi rise to objections of a hygienic nature al Here all pipes are excluded and will r outside the building in specially-prepare conduits run in the wide window-splays a branching direct to each floor through flu provided.

In the construction ferro-concrete on t Hennebique system has been adopted f floors, stanchions, beams, staircases, a lantern-lights. The floors are filled between the beams with hollow fireclay tube and are sufficiently thick to avoid projectin beams and contain the descending flues fro central ward stoves. The building work, b Messrs. Foster & Dicksee, Ltd., appears be excellent, and the architect, Mr. W. Pite, F.R.I.B.A., who kindly arranged an conducted the visit, paid a generous tribute t them, as well as to the clerk of work (Mr. Thomas Simpson) and to his own sta for the excellent help he had received from a When completed the hospital will evidentl be a notable one; the ingenuity with whic the complex mechanism of interrelate departments has been brought in contact a various points, while yet preserving t apparent architectural directness of lay-out and the equal ingenuity with which forms e detail usually abandoned as frankly hopeles have been persuaded into shapeliness, al give cause for congratulation. If a criticism may be made, it is that the site is rather closely covered with buildings—mor space would be desirable, but it is understood that neither for this nor for the placing of th Nurses' Home in a position not now generall favoured is the architect really responsible.

COMPETITION NEWS.

Municipal Offices, Bulawayo.

The first prize in connexion with the de sign for the new municipal offices at Bula wayo, which are to cost 35,000*l.*, has been awarded to Messrs. Gibson & Robertson, o Johannesburg; the second to Messrs Hawke & McKinlay, of Cape Town; and the third to Mr. Stanley G. Hudson, of Durban.—*South Africa.*

ILLUSTRATIONS.

The Work of Mr. Arnold Mitchell.

OUR illustration plates this week are given in connexion with the article on the next page, on the work of Mr. Arnold Mitchell. The illustrations are referred to in the course of the article.

FIFTY YEARS AGO.

From the *Builder* of March 29, 1862.

The Thames Embankment Bill.

IN moving last week for leave to bring in the Thames Embankment Bill, Mr. Cowper stated that the powers contemplated by the Bill would be committed to the Metropolitan Board, without any control or interference, except that the coal dues were at present in the hands of the Treasury. The Bill would empower the Treasury to pay the money to the Board, who, however, would be left free and unfettered in executing the purposes of the Act. The Bill was described as one for embanking the north side of the River Thames from Westminster Bridge, and for making new streets in and near thereto, and from Blackfriars Bridge to the Mansion House. After some discussion, leave was granted to bring in the Bill.

CONTEMPORARY ARCHITECTS AND THEIR WORK:

MR. ARNOLD MITCHELL.

MR. ARNOLD MITCHELL, F.R.I.B.A., the subject of our present notice, was born in 1863. is technical training commenced in the fice of Messrs. George & Peto, but he was t articled in the ordinary way. He also tered the Royal Academy Schools, being a ntemporary of Mr. E. Guy Dawber, and mpeted for prizes and studentships at e Royal Institute and the Architectural ssociation. Mr. Mitchell confesses that his holastic successes were not won at the st attempts or without much hard work, spite his abilities as a draughtsman; but a winner of the Institute Silver Medal, the ane Medallion, and the A.A. Medal he n claim a record of which any architect ight be proud. At a later stage he acted clerk of the works for a year, and he also rved in the Architect's office of the old ondon School Board, and acknowledges at the experience he got from these two cupations has been invaluable. At the ondon School Board he got a thorough ounding in the intricacies of school planning, d school design has formed a considerable rt of his practice. In the early years of his actice he collaborated with Mr. Alfred tler in school competitions, and several of eir designs have been illustrated in our ges.

For some years Mr. Mitchell played a conderable part in the doings of the Architecral Association. He was a member of the uncil in the year 1902-3, and again in the ar 1905-6. In 1903-4 he became one of the ce-Presidents, during Mr. Henry T. Hare's occupancy of the Presidential chair. The "sweets of office" had perhaps small attraction for him; the large amount of extra work entailed, and possibly the controversial matters inseparable from an official position, together with the insistent claims

[Portrait by Reginald Haines.

Mr. Arnold Mitchell, F.R.I.B.A.

of a large practice, combined to weary him of these honours, which he soon after relinquished without much regret. The country has a strong call for Mr. Mitchell; his acquisition of a fine old country house and the delight of his own fireside—an Adam fireside, with an Adam ceiling above it proved stronger than the call of late sessions and protracted Council meetings. And to the delights of his home Mr. Mitchell adds the pleasures of a beautiful garden, in the upkeep of which he finds one of his principal recreations.

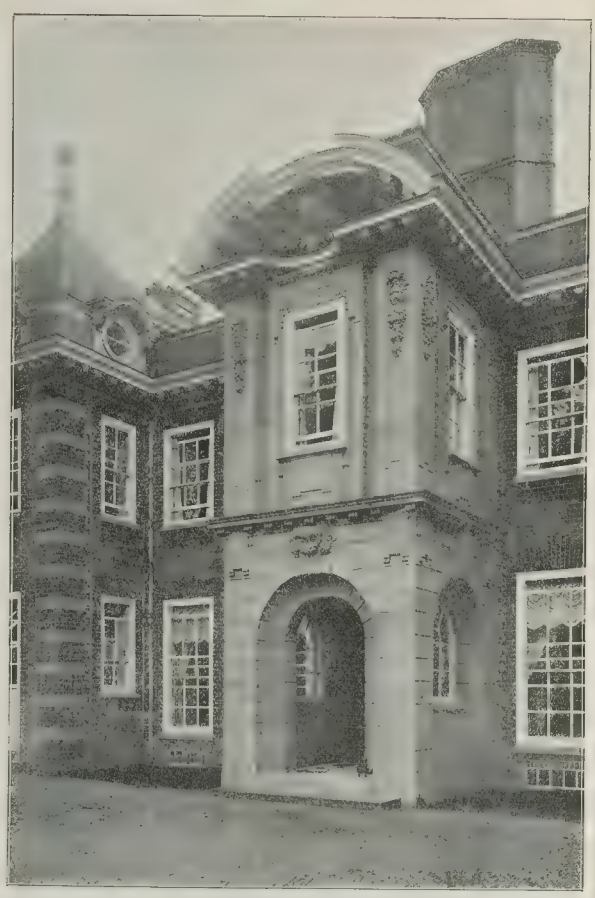
Since that time the London architectural world has—to its loss—seen comparatively little of Mr. Mitchell. He has a distaste for publicity; and thus very little of his work has been published. Indeed, we can only call to mind two of his recent important buildings that have been illustrated—the University College Schools at Hampstead, won in competition, 1905, and the Agricultural Schools at Cambridge University. Mr. Mitchell is, however, the designer of a very large number of houses, many of which are at Harrow, Northwood, Rickmansworth, and the surrounding districts. Drawings of these have been hung at the Royal Academy, where Mr. Mitchell has been a regular exhibitor. One of the works which Mr. Mitchell says gave him much pleasure was the additions and alterations to Tissington Hall, Derbyshire, a fine old stone mansion. A drawing of this appeared our issue for May 18, 1901. Of the buildings illustrated in this issue—mostly domestic—we can give little information, since their author will say little, except that they speak for themselves and are typical examples of his present work. Mr. Mitchell has been accorded Royal patronage, and his design for a Royal Villa and Golf Pavilion at Le Coq-sur-Mer, near Ostend, for the late King of the Belgians, was exhibited in 1903.

Mr. Mitchell is a great believer in the value of sketching to the student. Himself a distinguished draughtsman, he thinks it unequalled as a training for the hand and eye, and for tuition in composition. But the kind of sketching he advocates would probably be found a severe test of skill by any draughtsman. No rough notes or memory aids to be worked up in the studio afterwards; but straightforward freehand work on the spot. Of his own prowess in this field there are many pages of the *Builder* to testify. Some of Mr. Mitchell's drawings were included in "The Cathedrals of England and Wales" series, among them being Lichfield, west front (January 5, 1889); Peterborough (April 4, 1891); and Durham (June 3, 1893). Among other drawings of Mr. Mitchell's that we have published are the following:—1887: Chalons Cathedral (December 3, 17). 1888: Layer Marney Church, Essex; a corner of Peterborough Cathedral; and Feering Parish Church, Essex (July 21). 1889: The Triangular Bridge, Croyland (January 26); some Marshland Churches of Norfolk (August 10); and Senlis Cathedral—south-west Tower (December 21). 1890: Wrexham Church Tower (February 22). 1891: Choir Stalls, Amiens (January 10); XIIth-century Chapel, Houghton-le-Dale, Norfolk (May 3); Sketches at Peterborough (April 11). 1892: More Sketches at Peterborough (April 2). 1893: A.A. Excursion Sketches, Diss, Ipswich, and Bury St. Edmunds (August 19). 1894: A.A. Excursion Sketches, Wells and Glastonbury (August 18). 1895: Sketches in Normandy (January 5). 1901: Examples of Brickwork, Feering Parish Church, Essex (September 21). An examination of these drawings will show not only Mr. Mitchell's catholicity in choice of subject, but his great abilities in draughtsmanship. As a student he was accustomed to go out sketching for hours—sometimes twelve hours at a time in the long summer days—and confesses to often returning home thoroughly fagged-out. A cartridge block and a small T-square he considers essentials for good solid work, and drawing the subject out completely on the spot is not only fine training, but is a great aid to the study of perspective. Working on such lines means, in Mr. Mitchell's own words, "downright art."

Oak Carving in Great Hall: University College School, Hampstead.
Mr. Arnold Mitchell, F.R.I.B.A., Architect.

A fine set of drawings of Laver Marney vers secured for Mr. Mitchell the R.I.B.A. old Silver Medal in 1886, and these were blished in our issues for April 3 and 10 in that year. Mr. Mitchell's design for a Bank in a Country Town won him the A.A. Medal in 1885. The front is somewhat unusual, and both this and his Soane Medallion drawings are in a modern Renaissance style, showing some of the influence of his Principals, and of the terra-cotta period then flourishing. The Soane

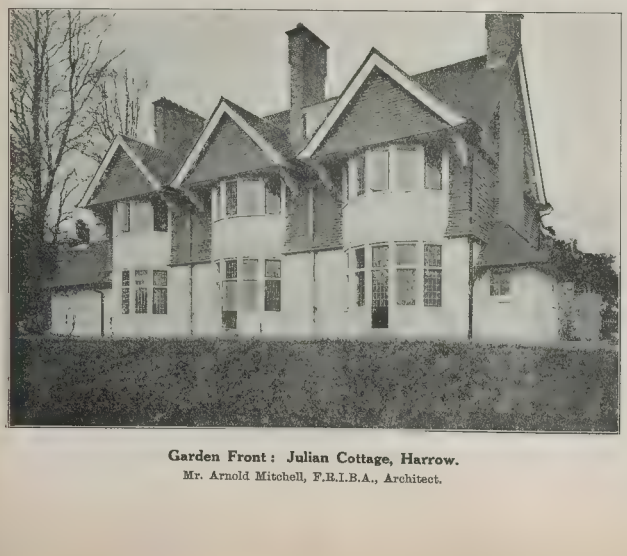
West Front of Rheims Cathedral.



From a drawing by Mr. Arnold Mitchell, F.R.I.B.A.

subject for the year 1885, when Mr. Mitchell won it, was a design for a Municipal Mansion, a building designed for civic entertainments and hospitality, and presumably as an official residence for a mayor. Mr. Mitchell says frankly he would recast these designs if he had to do them at the present day.

Mr. Mitchell spoke of his practice as one on pleasant lines, and referred to friendly relations with clients. This provoked a discussion on that well-worn topic of the average client and his irritability over extras. We put it to Mr. Mitchell that the architect, above and beyond technical qualifications, required unerring tact and a certain amount of magnetic influence to steer safely through the shoals of practice. We cited the case of the client with a definite sum to spend who, with the common failing of clients, wants a great deal too much for his money. This is not the kind of client that Mr. Mitchell is often troubled with; but he agreed that much unpleasantness generally ensues if the architect appears to be in the wrong. The first thing to do is to get the client's wishes and desires and show him the house he wants, deferring any question of cost or responsibility for cost until afterwards. It is extremely difficult for any architect to give an off-hand price. When the client has seen and approved the plans, tenders may be invited, and the lowest one may be tens or hundreds of pounds above the price the client is prepared to spend. It is then explained to the client that the plans show him the house he really wants, and the tender the amount it will cost. Is he prepared to pay for what he really wants? Mr. Mitchell's experience is that the great majority of men are prepared to enlarge their ideas of cost if they get what they really want. But if the client labours under the idea that the architect is designing a building to cost a certain sum, and the lowest estimate is far above it—moreover, if the architect looks aghast at the amount of the tender, murmurs the figure apologetically, and talks vaguely about "cutting down"—it is hardly surprising that the client takes his cue from the architect and attributes the whole difficulty to the latter's shortcomings. In Mr. Mitchell's opinion, the onus of cost must always rest with the client. The architect's function is to obtain for the client what he wants and see that he gets it.



We obtained some views of Mr. Mitchell on matters of practice. He believes in doing your job yourself, and then you know all about it. He advocates roughing out on cartridge paper, and in starting on the ½-in. details before commencing on the ⅛th-scale drawings. There are innumerable little points in the details which may affect dimensions in the smaller-scale plans; but with the procedure suggested the ⅛th-scale sheets work out smoothly straight away and require no alteration. Mr. Mitchell will not have "extras." It requires some organisation to avoid them, but by the thorough working out of a job before it is commenced he thinks they can be avoided. With his smaller houses he contrives generally to have only one contract drawing on which all the plans, sections, and details are given; and this makes for simplicity in working. If details are only supplied as the job proceeds, openings for "extras" to come in are multiplied. Builders much prefer this complete working out of the job beforehand; and thus Mr. Mitchell finds his business relations with builders work very smoothly. In fact, he states he has designed eleven houses for builders for their own occupation.

Another maxim Mr. Mitchell enjoins is that you should not worry your brains with two things at once. Work one thing out and finish it, and then start on the other. He has done a good deal of competition work and believes in getting well ahead with this branch of practice. He showed us a set o

ngs to be submitted in a limited tition, completely finished three weeks sending-in day; and he stated that his usual practice to get competition forward. Mr. Mitchell has many big in hand at the present time; among them a big office building in the North, of which we saw complete plans, also a number of country houses. In spite of the calls of a large practice, Mr. Mitchell is a firm believer in not worrying. By organising his work on the lines indicated, and by ruling out all the unessentials, he manages, as he himself confesses, to find life very endurable, and to secure much pleasure in the home and garden of which he speaks with so much enthusiasm and affection.

THE BUILDING TRADE.

THE RIGHT TO WORK.

IN recent years the trade unions introduce a Bill known as the Unemployed Workmen Bill, the object of which was to affirm a general principle that every workman possessed the inalienable right to work, and that, if he could not obtain work, employment must be found for him, with the important proviso that he was not to be employed at less than the standard wages ruling in the district. This Bill became known as the "Right to Work" Bill. This expression is somewhat unfortunate, as the trade unions are the very last societies to recognise the inherent right in each man to work as he wills, and they really only recognise a right to work with the permission of the unions. If any man attempts to work without their leave and licence he is at once termed a "blackleg," and the special powers the trade unions obtained in the Trade Disputes Act are brought to bear upon him or his family in the form of "peaceful persuasion."

It is the public who are now beginning to call for a Bill which shall recognise the right to work, and for adequate protection for those who wish to exert that right. The strike in the coal trade, universal as it is, has held up industries in no way connected with the particular dispute, and thousands of workpeople, through the action of one trade federation, have been denied their right to work. Thus the zeal of the trade unions for the principle of the right to work has been proved to be "skin deep," and, in fact, their attitude presents no principle at all. Had the employers in the coal trade resorted to a lock-out universal in its nature on the scale of this strike it can easily be imagined how the trade unions would have characterised such action on their part, and how the principle of the freedom of action would have been invoked. The Chancellor of the Exchequer in the first day's debate on the Minimum Wage Bill indignantly asked, "Can a man be compelled to work?" The answer is, of course, in the negative, but a man can be compelled to allow others to work, and it is for compulsion of this nature that the nation is now calling. A disastrous strike such as that we have been experiencing would never occur in an exceedingly well-paid branch of employment involving no very great special training were the right to work but recognised. Even in the railway strike the companies could have filled the places of the strikers three times over had it not been for the intimidation of the unions concerned. It is now quite clear that it is essential to the welfare of the nation that the right of each individual to ply his avocation on such terms as he may deem fit must be restored and maintained, and that methods of intimidation practised by organised bodies, be they associations of masters or men, are inconsistent with the liberty of a commercial nation, and that the whole country must now assert its freedom and curtail the privileges of such societies, which, after all, but represent a minority, and a small minority, of the population.

LONDON ASSOCIATION OF MASTER STONEMASONS.

THE annual meeting of this Association was held at Cannon-street Hotel, E.C., on March 14, when the following were present:—Mr. Fred Corben (President) in the chair; Mr. C. W. Courtenay, J.P. (Vice-President); Mr. F. J. Barnes, C.C.; Mr. T. Beckley, Mr. J. Bysouth, Mr. W. Bryant, Mr. William Bryant, Mr. E. J. Fox, Mr. E. Grice, Mr. H. J. E. Lucas, Mr. Frank Mortimer, Mr. E. Morris, Mr. W. Pangbourne, Mr. Ernest E. Way, Mr. J. Way, Mr. Walpole Collins, Hon. Secretary and Treasurer.

A cordial vote of thanks was accorded to Mr. Fred Corben for the services rendered by him to the Association during the past year, and Mr. C. W. Courtenay, J.P., was unanimously elected President for the coming year. Mr. Fred Corben, on relinquishing the office of President, becomes ex-President. Mr. Stephen Collins, M.P., and Mr. T. Sturge Cotterell, J.P., were elected Vice-Presidents, and the following were chosen to serve on the Committee:—Mr. T. Beckley, Mr. E. Grice, Mr. F. Mortimer, Mr. W. Pangbourne, Mr. Ernest E. Way, Mr. J. Bysouth. Mr. Walpole Collins was re-elected as Hon. Secretary and Treasurer.

THE INSTITUTE OF BUILDERS.

THE twenty-eighth annual general meeting of the Institute of Builders was held at the offices, Koh-i-noor House, Kingsway, W.C., on the 20th inst.

The minutes of the last annual general meeting were read and confirmed, and the audited accounts of the Institute and of the Institute Benevolent Fund were submitted by the Treasurer (Mr. J. Carmichael, J.P.), and were adopted.

The following officers were elected for the ensuing year:—

President—Mr. H. Arthur Bartlett (Messrs. Perry & Co. (Bow), Ltd.).

Vice-Presidents—Mr. Ernest J. Brown; Mr. F. G. Rice (Messrs. Rice & Son); Mr. E. J. Strange (Tunbridge Wells); Mr. Leonard Horner (Messrs. Ashby & Horner).

Treasurer—Mr. F. L. Dove, London County Council.

To fill vacancies on the *Executive Council*—Mr. A. B. H. Colls (Messrs. Trollope & Colls, Ltd.); Mr. Walter Lawrence, jun. (Messrs. Walter Lawrence & Son); Mr. F. M. May (Messrs. Holland, Hannen, & Cubitts, Ltd.); Mr. James F. Parker (Messrs. Patman & Fotheringham, Ltd.); Mr. E. S. Rider (Messrs. T. Rider & Son); Mr. William Willett.

Hon. Auditors—Mr. Eric M. May (Messrs. Holland, Hannen, & Cubitts, Ltd.); Mr. G. C. Hudson (Messrs. Hudson Brothers).

A hearty vote of thanks was given to Mr. James S. Holliday (Messrs. Holliday & Greenwood, Ltd.) for his services during the past year.

The following report from the Council was approved:—

"The Council, in presenting the Annual Report, regrets that, although the building trade has to a certain extent improved, it still continues to be in a very unsatisfactory condition. For some years past the competition has been particularly acute, and this, coupled with the general unrest in the country and the prospective heavy burdens about to be imposed on employers by the Legislature, render the prospects of a desirable change anything but promising.

Attention has been given to Parliamentary matters affecting the building trade; steps have been taken to try to effect such changes as are desirable in existing Acts, and to judiciously modify Bills of importance before the House of Commons. In these matters the Council has been glad to co-operate with other bodies.

The Council has given much time and care to the formulation of an agreement for sub-contractors who are specified by architects, and to the alterations which this document entails in the agreed form of contract. The proposed form of sub-contractor's agreement was submitted to the National Federation, being one of the signatories of the agreed form, and was practically approved. It was then brought informally before the R.I.B.A. at a Conference on the subject, and it is now under the consideration of that body.

The President, Colonel George Hawse, Mr. Trollope, and Mr. J. Styles, kindly gave evidence before the Home Office Departmental Committee, which Committee was appointed to investigate the dangers attending the use of white-lead in the preparation of paints. Having considered the matter most closely, the Council came to the conclusion, in the interests of the trade, that it would be preferable to endeavour to exclude altogether the use of white-lead than to have exacting regulations introduced by the Legislature which would be very irksome to employers.

Mr. F. G. Rice is the representative of the Institute on the Home Office Committee, and the building trade is under great obligations to him for his close and valuable assistance in the matter.

The movement to re-establish a system of apprenticeship has occupied the attention of the Council, and suggestions have been submitted to the London County Council, which are now under consideration.

The existence and utility of technical schools, proper discipline, payment of premiums, etc., are matters which affect this question and need careful consideration.

Your Council and the Council of the London Master Builders' Association jointly took part in the consideration of suggestions made by the Quantity Surveyors' Association on the question of items to be embodied in the preliminary bills. The results of the Council's comments on the suggestions were forwarded to the Quantity Surveyors' Association in due course, and it is to be hoped that good will be derived in consequence. . . .

Many thanks are due to Mr. Frank May, J.P., Mr. Joseph Randall, Mr. G. Haworth, Mr. A. T. Pollock, and to the India Public Works Department for contributions to the Institute Library.

The following grants were made from the Institute Benevolent Fund:—Builders' Benevolent Fund, 100*l.*; Builders' Clerks' Benevolent Institution, 10*l.* 10s.; Provident Institution of Builders' Foremen and Clerks of Works, 10*l.* 10s.

It is with deep regret we report the death of Mr. Joseph Bell, J.P. (President, 1907-8), and of the retirement of Mr. F. J. Dove. Both these gentlemen have done yeoman service to the Institute and were personally much respected and esteemed by a large number of friends in the trade. . . ."

INCORPORATED INSTITUTE OF BRITISH DECORATORS.

ANNUAL DINNER.

THE annual dinner of this Institute was held on Monday at the "Trocadero," Piccadilly-circus, Mr. J. D. Crace, President, in the chair, supported by Mr. H. Drummond, President Association of Master House Painters in Scotland; Mr. T. N. Richards, President of the National Association for England; Professor Reginald Blomfield, A.R.A., and Messrs. H. D. Searles Wood, J. C. Nicholson, M. C. Cowtan, A. B. Cowtan, W. H. Pitman (Treasurer), W. Stewart-Greene, A. Mackay, E. Graham Simpson, F. Jones, J. W. Garson, W. G. Sutherland, F. Carpenter, J. Sanderson, F. De Jong, H. N. Hornsby, W. N. Bridges, J. R. Chappell, F. G. Dear, A. S. Jennings, P. A. Jones, F. W. Englefield (Secretary), and others.

The loyal toasts having been suitably proposed by the President and honoured,

Mr. W. Hayward Pitman

proposed the toast of "The Incorporated Institute of British Decorators and its President." He said the Institute was incorporated in 1899, but he was sorry to say that in London there had not been that development in regard to membership as they would have liked, and London did not seem to appreciate the work they were doing as much as was the case in the North and in Scotland, where they seemed to appreciate the advantages and benefits of the Institute, for they helped the Institute in every way. The Institute was very much indebted to the Northern and the Scotch branches. The Institute had been able during the last year to revive the Travelling Studentship very much because of the help of the President. Nineteen sets of drawings had been sent in, and as one of the judges he could

that a better collection of works of art by
ig people could not have been brought
ther. The winner of the Travelling Student-
was Miss Dora Bard. It was hoped to
inue the Studentship next year and other
s. The Institute had been very fortunate
ts President, and they had been glad to
him at their head from the beginning
s existence.

President,

ply, said he had been President for twelve
s, and he began to think that was too long,
that the Institute wanted a new President.
Institute did not exist with the object of
porting trade interests; its *raison d'être* was
ncourage and forward the artistic side of
ration. He thought that the artistic use
olour and decoration should be more studied
encouraged. Colour was one of those things
ch might do much to improve or much to
roy if badly used, and it was not unnatural
clients and architects should look with
siness to the approach of the decorator
ss they knew what he was capable of, and
that must be partly attributed the un-
promising use of white as a ground. The only
in which we got white in nature was in a
watorm, and that could not be said to convey
idea of comfort, and even then the chance
that the sky had something of colour in it.
ought to be able to make use of colour, and
rejoiced that they had been able to send a
lent abroad to study the artistic and beauti-
y-adapted colour decorations of Italy.
taly one was surrounded by a great deal that
bad as well as good, but a very little
ning ought to enable a student to recognise
t was worth studying and what should be
ided. The first object of the Institute
to encourage social intercourse among the
nbers and the exchange of ideas. Then the
ouragement of the study of decoration as
art was a self-evident object of the Institute,
to assist the coming generation of decorators
qualify themselves for the pursuit of the
utiful was in itself a good and noble object
pursue. The work of the Institute did not
ude watching over the trade interests of
orators, because that was already admirably
e by the National Association of Master
nters, but it was concerned with those objects
ch made for the honour and welfare and the
acity and efficiency of the decorator of
day.

e President

sequently proposed the toast of "The
ional Association of Master Painters of
gland and Wales, Scotland and Ireland,"
remarked that these Associations had done
reat deal for the master painters of the
ntry in many ways. The Associations had
ught together men engaged in the same
k and had given them an opportunity of
ussing their interests together, and had given
ide outlook to the business and calling of
nting generally, and had done much for the
ucation of the younger members and
prentices of the trade.

. Richards,

o responded for the National Association of
gland and Wales, referred to the excellent
rk being done by youths as the result of
instruction received by the Schools of Art
l by other methods.

. Drummond,

e responded for the Association for Scotland,
ke of the excellent work carried on by the
titute, and of the energetic work of Mr.
thorpe in connexion with the Association.
Mr. Sutherland also responded.

The President then proposed the toast of
The Guests," coupled with the name of
ofessor Reginald Blomfield, A.R.A.

ofessor Blomfield

d that at one time and another he had
en a great deal of trouble to explain the
ference between architecture and decora-
n, and some of his critics had said
t because he had said that decoration
s not architecture and architecture not
coration that therefore he did not care
out decoration. That was a ridiculous libel,
decoration was one of the primitive instincts
humanity; but, apart from that, it was really
last and, if he might say so, the fine flower of
hitecture itself. Of course, there was always
awkward question of who was to superin-
d the work, viz., the decorator or the architect?
ars ago an eloquent Frenchman wrote a book
"Primaticcio" to show that the arts could
ver go right till the painter took charge of
the decorative arts. He did not think that was quite right, because, much as he regarded and admired the painter and the decorator, he did not feel that they were the men who ought to control the ship. Besides the painter and decorator there was the sculptor to be considered, and he had to play a very important part in decoration. The only man who stood apart was the architect, in so far as he held an independent position between the arts, and was a man who ought to know where he wanted emphasis and when to call on the decorator to help him—how he wanted his panels treated, etc. The architect was the man who set the time and the tune, though he did not feel that this question of leadership was so important as that they should all pull together. What we all suffer from in this country—and elsewhere, too—was a certain isolation of the arts the unconscious jealousy of one art to another, and he felt sure they would agree with him that this was quite wrong, and that they should all try to pull together. He believed from what he had heard that the Institute was doing admirable work, and they were fortunate in their President, who held a name well known in the list of English decorators.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE thirty-fourth annual dinner of the Builders' Clerks' Benevolent Institution, was held on Tuesday, March 26, at the King's Hall, Holborn Restaurant, the President, Mr. R. Dudley Bartlett, of Messrs. Perry & Co. (Bow), Ltd., in the chair. About 400 were present.

The Chairman, in proposing the toast of the "Builders' Clerks' Benevolent Institution," said that when he looked down the long list of Past-Presidents of the Institution he saw that it comprised the names of practically all the great men of the building trade. His father occupied that chair some twenty-one years ago, and he was proud to follow in his father's footsteps. He, however, was bound to say it was the first time his father had consented to be overshadowed by one of his sons. He, himself, found that the position of President of that Institution was no sinecure, but necessitated the giving up of a great deal of leisure time. The Institution was founded in 1866, which was forty-six years ago, and its objects were to provide pensions to aged clerks and those who were incapacitated; and also to provide for their widows. It seemed to him that there was a very large number of charitable institutions in the country, and consequently it was necessary to make sure they were supporting the most worthy objects. It was argued, and he thought quite rightly so, that a man who spent his life at his work should have saved enough to keep him in some sort of comfort for the rest of his life. It was the men who were incapacitated or their widows they had to deal with. The Institution had good reason for feeling proud of itself in that respect. Last year they paid 776*l.* to thirty-one pensioners out of an income of 790*l.*; however, the expenses brought the total payments to 870*l.* They were consequently dependent upon the generosity of those present to put them on the right side. The Institution had paid 10,000*l.* in pensions, besides several hundred pounds in temporary relief. They had also given 1,000*l.* to the charitable schools. In these days, when trade was practically as bad as it could be, it seemed to him an extraordinary thing that the merchants and others had come forward and assisted them in such a generous way. He thanked them all for the way they had helped the Institution.

Mr. H. A. Bartlett (President of the Institute of Builders) said the toast he had to propose was that of "The Architects and Surveyors." It was a time-worn and time-honoured toast. He thought, however, that instead of being called architects they should be called the compendium of useful knowledge. It seemed to him that there was not much room in the world for anybody but architects. They fulfilled so many useful positions nowadays—not only were they architects, but they were undoubtedly financiers, diplomatists, and a dozen other things. It very often happened that when a client went to an architect he had decided to have a 5,000*l.* house built, but after seeing the architect and having a quiet chat with him he was firmly of the opinion he could not do with a house of less than 10,000*l.* value. The architect then went to the builder and showed him the plans of a very beautiful house, and expected him to build it for about 2,000*l.* He objected rather to the architects entering the field of building which they seemed to do nowadays. They not only did all the planning, etc., in connexion with their profession, but they practically arranged the whole of the building operations, and consequently the builder would soon cease to exist, or, at any rate, become a mere subcontractor. He sincerely hoped the architects would soon begin to realise that builders could do a little bit of joinery and a little digging without getting an expert to do it. Regarding the surveyors, he looked upon them as being an extraordinary set of men, as they always seemed to satisfy all parties. He coupled with the toast the names of Mr. Chas. Frankiss and Mr. Walter Lawrance.

In reply, Mr. Frankiss said he felt it a privilege to respond after what had been said about them by Mr. Bartlett. He could assure them it had given him great pleasure in hearing of the progress reported by the Chairman. He hoped the Institution would continue to maintain that successful state, and he thanked them for the way they had received the toast.

Mr. Walter Lawrance, F.S.I., who also responded, said he was quite surprised when he saw the report of the Institution in the *Builder* of their wonderful success, especially in these days when they were all struggling to make both ends meet. There had always been a very nice feeling between the architects and the builders' clerks, as they had to look to them for many details of their business, and they were often very difficult points. He was speaking from an experience of over thirty-six years, and he was sure the Institution would receive all their support.

Mr. F. S. Oldham then proposed the toast of "The Builders and Builders' Merchants," and said that he was coupling with the toast two names, one was Mr. Thomas F. Rider, who, as they all knew, was the only gentleman who was President for two years running, viz., in the years 1878-1879.

Mr. Rider, in reply, said he had been connected with the Institution for the last thirty-four years, and he could remember the time when he presided at a meeting of the Institution at which only the members of the Committee were present. He had prepared a very elaborate speech for the occasion, but that was consigned to the waste-paper basket, and the Committee then unanimously proceeded to re-elect themselves. The building trade at the present time could be described as the one which required more trouble to get the work, less profit when that had been done, and after it was the greatest difficulty to get the money. Nowadays it required the wealth of a Cræsus and the patience of a Job.

Mr. Alexander Ritchie, who also responded, said he wished the Institution every success, but he hoped that soon there would not be any need for it. If only the terrible strikes could be done away with it would be a step towards that, as the strikes were the curse of the country.

Mr. John Austin, A.C.I.S. (the Secretary), announced that the total list of donations that evening was 414*l.* 2s. 6d.

GOVERNMENT CONTRACTS.

THE following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department:* Paving slabs for H.M. Dockyard, Chatham—Patent Victoria Stone Company, Ltd., 11-13, Hamilton House, Bishopsgate-street, E.C.; steelwork for aerial ropeway, Cape of Good Hope—The Butterley Company, Ltd., Butterley, near Alfreton; works service: extensions of gun-mounting shop, H.M. Dockyard, Portsmouth—Messrs. Perry & Co. (Bow), Ltd., 56, Victoria-street, S.W. *War Office:* Works services: additions to gymnasium, Lichfield—Mr. A. Robinson, Woodbine Works, Idle, Bradford; additions and alterations to right wing, Duke of York's headquarters, Chelsea—Messrs. Holliday & Greenwood, Ltd., Loughborough Park Works, Brixton; construction of reservoir, Royal Gunpowder Factory, Waltham Abbey—Mr. J. A. Ewart, 21, Old Queen-street, Westminster; drainage work, Wool Camp, Dorset—Messrs. Jesty & Baker, Castlestown, Portland; drill and gymnastic hall, Bordon -Messrs. Thomas & Edge, Anglesea-avenue, Woolwich; improvements to married soldiers' quarters, etc., Guildford—Messrs. W. F. Blay, Ltd., Dartford; improvements to married soldiers' quarters, etc., at Weedon—Mr. W. W. Roberts, High-street, Weedon; installation of electric light, right wing of Duke of York's headquarters, Chelsea Messrs. W. G. Heath & Co., 35, George-street, Plymouth; plunge baths and field practice ranges, Willsworthy, Devon—Messrs. Woodman & Son, Batholomew-street, Exeter; remodelling and extending military hospital, Fort Pitt, Chatham—Mr. C. E Skinner, Railway-street, Chatham; supply and

erection of shed for gun drill, etc., Shoeburyness—Messrs. G. Sands & Co., Ltd., Colwick, Nottingham. *India Office, Store Department:* Bridgework—Brandon Bridge-Building Company, Motherwell; bricks—Messrs. J. Grayson, Lowood, & Co., Deepcar, Sheffield; cement—Associated Portland Cement Manufacturers, Portland House, Lloyd's-avenue, E.C. *Crown Agents for the Colonies:* Bridgework—Sir William Arrol & Co., Ltd., 32, Victoria-street, S.W., The Horseley Company, Ltd., Tipton, Staffs; cement—Wouldham Cement Company, Ltd., 55, Great St. Helens, E.C. *Office of Works:* Builders' work: construction of subway at Birmingham Parcel Office—Mr. E. Crowder, Farm-street, Birmingham; demolition of old buildings and erection, East Ham Branch Post Office—Messrs. J. Chessum & Sons, 7A, South-place, E.C.; extension of Hampstead S.O.—Messrs. R. A. Lowe & Co., Chislehurst, Kent; extension, Haverfordwest Post Office—Messrs. W. Bowers & Co., Bath street, Hereford; extension, Hinckley Post Office—Messrs. Walter Moss & Son, Coalville, near Leicester; adaptation, Liverpool temporary parcel office—Mr. G. L. Desoer, Everton-road, Liverpool; demolition of old buildings and extension of Portsmouth Post Office—Mr. J. Privett, Cottage-grove, Southsea; work in connexion with hydrants, Queen Victoria Memorial—Messrs. John Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.; erection of kiosk, Primrose-hill, Regent's Park—Messrs. Pasterfield & English, Sunnyhill-road, Streatham, S.W.; repairing and covering reservoirs and constructing cascading arrangement, Windsor Great Park—Messrs. Matthew Hall & Co., 88, Wigmore-street, W.; engineering works: heating apparatus, Birmingham new parcel office—Messrs. Cannon & Hefford, Stanbury-road, Peckham, S.E.; heating, Leeds Head Post Office—Messrs. J. F. Phillips & Son, Ltd., Mark-lane, Leeds; heating, hot water, and fire mains, Royal Courts of Justice—Messrs. Ashwell & Nesbit, Ltd., 12, Great James-street, W.C.; heating, Park (Western) Telephone Exchange—Messrs. Cannon & Hefford, Stanbury-road, Peckham, S.E.; water softening plant, Windsor Castle—Mr. C. J. Haines, "Rogorte," Worple-road, Wimbledon, S.W. *General Post Office:* Laying line of pipes and Sykes ducts, London-Watford, Section II.—Messrs. Bennie & Thompson, 80, Liverpool-road, Warrington; laying line of pipes, Woodford—Messrs. W. & C. French, Buckhurst-hill, Essex. *Metropolitan Police:* Reconstruction of Hammersmith Police-station—Messrs. Adamson & Sons, 129, High-street, Putney. *Commissioners of Public Works, Ireland:* Building works: erecting and furnishing Aille National School, Co. Galway—Mr. Patrick Burke, Turlough, Bellharbour, Co. Clare; erecting and furnishing Carrownaganonagh National School, Co. Donegal—Mr. William Mooney, Milford, Co. Donegal.

LONDON MASTER BUILDERS' ASSOCIATION.

THE Council of the London Master Builders' Association met on the 21st inst., when Mr. James S. Holliday (President) presided.

The Report of the Bricklayers' Conciliation Board meeting, held on the 14th inst., was read, and the Finance Committee's Report was read and approved.

The rate of subscription to the Association for the year 1912 was determined upon.

Certain legal cases were reported and were referred to a special Committee for consideration and report.

The various Committees and representatives on other bodies were chosen.

Matters were considered connected with a petition to the Prime Minister against the Trade Disputes Act (1906). The petition was presented by Mr. Basil Peto, M.P.

Applications for proposed alterations in working rules agreements with the Amalgamated Society of Carpenters and Joiners and Stonemasons were received, together with an application for the formulation of a working rule agreement with the labourers. They were referred to a Special Committee for consideration and report.

Various other trade matters of interest and importance were discussed.

New members of the Association were elected:—

(1) Ordinary member—Messrs. Allen, Fairhead, & Son, Enfield.

(2) Associate member—Messrs. John Daymond & Son, Westminster.

New member nominated:—

(1) Associate member—Messrs. Messers, Ltd.

GENERAL BUILDING NEWS.

CHURCH, HOVE.

This church has been erected at a cost of 6,000*l.* from the designs of Mr. E. Proctor, architect, of London. The contract was carried out by Messrs. W. A. Field & Cox, builders, of Brighton.

ENGLISH CHURCH, VERSAILLES.

The foundation-stone was laid on March 15, by Dr. Bury, Bishop for Northern and Central Europe, of the new English church at Versailles, which replaces the church which was built fifty years ago, and was destroyed by fire on January 29, 1911. The architect is M. Vye-Parminter, of Paris, whose designs are after the Gothic style. The ground on which the church is being built is of a certain historical interest. An English church or place of meeting existed on this site as far back as during the reign of the Roi Soleil, Louis XIV., but was abandoned after the Edit de Nantes, when the English residents left Versailles. The building was then used by the military authorities as a bakehouse, and later on became the property of Admiral Touchard, whose family graciously returned the property to the resident chaplain of Versailles some fifty years ago. A small church was built, and the ground and building transferred to the Colonial and Continental Church Society, which is now undertaking the building of the new church. The style will be Gothic, simple in form, but of good effect. The chaplain, Rev. Vivian Evans, is obtaining the stained glass windows from Munich, and the pulpit is being carved by the "Christ" who takes part in the Passion Play at Ober-Ammergau.

CO-OPERATIVE BUILDINGS, WHEATLEY HILL.

These new premises for the Sherburn Hill Co-operative Society have been erected at a cost of about 6,000*l.* The architect for the work was Mr. J. W. Taylor, of Newcastle, and Mr. J. Morris, of Felling, was the contractor.

COAL AND SHIPPING EXCHANGE, CARDIFF.

The central hall of this exchange has been renovated from the designs prepared by Mr. Edwin Seward, architect, and the sculpture work has been executed by Mr. Tom A. Jones.

PAVILION, NEWQUAY.

Messrs. Cowell & Cowell, of Newquay, are the architects for this pavilion, which is being erected at the lower end of Harbour-crescent at the corner of Beach-road. The auditorium is to have a sloping floor, but a second floor will be provided for dances, etc., and will hold 800 people. Round the auditorium a raised promenade is to be erected to seat an additional 700 people. There will also be a promenade outside facing the sea. The builder is Mr. G. Miners, of Penzance.

NEW BUILDINGS IN LONDON.

Extensive rebuilding, Waterloo-place, S.W.; Messrs. Higgs & Hill, builders, South Lambeth, S.E. Extensions to United Service Club, Pall Mall, S.W.; Mr. F. G. Winter, builder, Putney, S.W.

TRADE NEWS.

Under the direction of Messrs. Yeates & Jones, architects, Worcester, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Redhill School, Worcester.

The Wycliffe Memorial Church and Schools, Preston, are being supplied with Shorland's patent exhaust roof ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

Cwm.—Fifty houses (6,375*l.*); Messrs. J. Marles & Son, builders, care of Mr. Marcus Hoskins, Estate Agent, Town Hall, Swansea.

Dellingburn.—Offices (1,200*l.*); Mr. J. A. Robertson, electrical engineer, Burgh buildings, Greenock.

Doncaster.—Conversion of premises, High-street, into bank for the National and Provincial Bank Company; Mr. C. H. Brodie, architect, 15, Bishopsgate, E.C.; Messrs. H. Arnold & Sons, builders, Printing Office-street, Doncaster.

Dumbarton.—Swimming-baths (10,000*l.*); Mr. M. C. Denny, architect, 17, High-street, Dumbarton.

Dundee.—School (1,910*l.*); Messrs. Spiers, Ltd., builders, Glasgow.

Eastbourne.—Picture theatre, St. Aubyn's-road; Mr. A. Ford, architect, Gildredge-road, Eastbourne.

Exeter.—Additions to Royal Deaf School (2,900*l.*); Mr. J. Jerman, architect, 1, Bedford-circus, Exeter.

Gillingham (Kent).—Offices at Electricity Works (900*l.*); Mr. H. E. Phillips, builder, Livingstone-road, Gillingham. Mineral water factory, Napier-road, for Messrs. White & Son; Mr. J. J. Freeland, architect.

Glasgow.—Washhouse (5,200*l.*); Mr. A. B. M'Donald, Surveyor, Town Hall, Glasgow. Alterations and additions to buildings, Lochburn-road, for Glasgow Magdalene Institution.

Gravesend.—Church, Pelham-road South: Vicar, Wycliffe Church, Gravesend.

Grays.—School (2,735*l.*); Messrs. Brown Brothers, builders, Grays.

Halifax.—Works, Skircoat New-road, for the Trinity Garage Company, Ltd.

Harrogate.—Additions to pump-room, etc.: Mr. F. Bagshawe, Surveyor, Town Hall, Harrogate.

Holmfirth.—Warehouse, etc., Ford Mill, for Messrs. Wood & Burtt.

Ightham.—School; Mr. W. H. Robinson, Caxton House, Westminster, S.W.

Invercowie.—Additions to premises for Messrs. James Jack & Sons, Ltd., net manufacturers.

Kidderminster.—Extensions to Pike Mills for Messrs. Watson Brothers.

Kirkintilloch.—Proposed parish church; the Heritors, Parish Church, Kirkintilloch.

Leeds.—Clubhouse (2,500*l.*); Secretary, Moortown Golf Club, Leeds.

Letchworth.—Proposed public hall corner of Eastcheap and Town-square; Secretary, Howard Hall Association.

Lonend.—Additions to mills for Messrs Smith Brothers & Co., shawl manufacturers.

Lowestoft.—The following plans have been passed:—Six houses and shop, London-road South and Kendal-road, for Messrs. Woolnough Brothers; four houses, Carlton, for Mr. F. W. King; bottling store and warehouse, Harvey-street, for Mr. H. G. Lawrence; four houses, London-road South, for Mr. W. Beaumont.

Lye (near Stourbridge).—Theatre; Mr. J. Shaw, architect, 39, Newhall-street, Birmingham.

Macclesfield.—Receiving wards; Mr. Bradburn, architect, Macclesfield.

Maesteg.—Bank, Talbot-street, for the London and Provincial Bank.

Monaghan.—Twenty-four houses (4,315*l.*); Mr. J. Hanna, builder, Terenure.

Newmarket.—Technical institute (1,035*l.*); Mr. H. J. Linzell, builder, Newmarket.

Nottingham.—Proposed rehousing scheme (140,000*l.*); Mr. F. B. Lewis, Architect, Town Hall, Nottingham.

Penrhwtyn.—Infirmary (21,600*l.*); Mr. Evan Thomas, builder, Seven Sisters.

Ramsgate.—Concert hall; Mr. A. D. Sackett, builder, Broad-street, Ramsgate.

Raunds.—Extensions to factory, Park-road, for Messrs. Neal & Gates.

Reigate.—School; Messrs. T. R. & V. Hooper, architects, Market Hall-chambers, Redhill.

Ripley.—School; Mr. G. Widdows, architects, St. Mary's-gate, Derby.

Rochdale.—Extensions to infirmary (18,000*l.*); Mr. H. Healey, architect, of Messrs. Horsall & Healey, Rochdale.

Rochester.—Garage and workshops, High-street, St. Nicholas, for Messrs. Robins & Day.

Royton.—Cotton mill, for the Park and Sandy-lane Mill Company.

Rugby.—Drill hall (5,000*l.*); Mr. T. Willard, architect, Market-place, Rugby.

Scallsceugh.—Farm buildings, etc.; Mr. J. Matindale, architect, Castle-street, Carlisle.

Sheffield.—The following plans have been passed:—Twenty houses, Clarence-road, for Mr. H. E. Fern; additions and alterations, Salutation Inn and White Hart Inn, St. Philip's-road; Franklin Hotel, Franklin street; Lord Nelson Inn, Arundel-street, for Messrs. W. Stones, Ltd.; alterations and additions, "Swan with Two Necks" public-house, Eyre street, and Fore Tavern, Mill sands, for Messrs. T. Berry & Co., Ltd.; four houses, Murray-road, for Mr. A. J. Belton; extensions to foundry, Newhall-road, for Messrs. Cammell, Laird, & Co., Ltd. Extensions, Town Hall; Mr. F. E. P. Edwards, Architect, Town Hall, Sheffield.

Southampton.—The following plans have been passed:—Four houses, Ampthill-road, for Messrs. Weston & Burnett; cinematograph theatre, house, and shop, Shirley-road, for Messrs. Jurd & Sanders; additions, South Hants Waterworks Offices, Shirley-road, for Mr. H. Cawte.

South Ockenden.—School (2,800*l.*); Messrs. Burtwell, builders, Romford, Essex.

Spennymoor.—Town Hall (15,000*l.*); Mr. G. T. Wellburn, architect, Middlesbrough.

Stoke-on-Trent.—Extensions to hospital (3,626*l.*); Messrs. Bennett Brothers, builders, Newcastle-street, Burslem.

Stretford.—Plans have been passed as follows:—Forty houses, etc., Derbyshire-lane, for Mr. John Maunders; extensions to power-station, Trafford Park, for the Trafford Power and Light Supply, Ltd.; school, Montague House, for the Royal Schools for Deaf and Dumb.

Swansea.—Y.M.C.A. headquarters, St. Helen's-road (11,500*l.*); Messrs. Lloyd Brothers, Argyle-yard, Oystermouth-road, Swansea.

Tamworth.—School (6,145*l.*); Mr. Ernest Dent, builder, Aldergate, Tamworth.

Torquay.—Medical baths, etc.; Mr. Taylor, architect, care of Mr. H. A. Garrett, Engineer, Town Hall, Torquay. Plans have been passed for a garage in Teignmouth-road for the Torquay Chelston Steam Car Company.

Vaenor.—School (960*l.*); Mr. J. J. Meredith, builder, Llanidloes.

Wakefield.—Enlargement of infirmary; Messrs. Simpson & Firth, architects, Southgate, Wakefield.

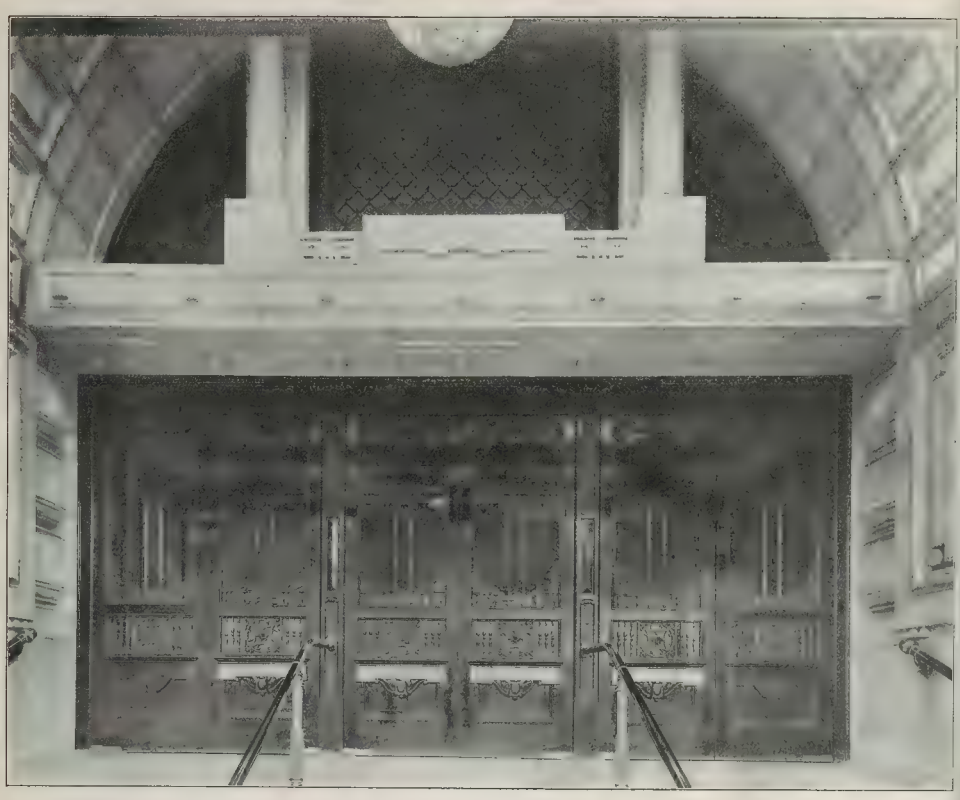
Walker.—Buildings, etc. (40,000*l.*), near Mitchell and Foster streets, for Sir W. W. Armstrong, Whitworth, & Co.

Wednesbury.—Baths and Town Hall extensions; Mr. E. M. Scott, Surveyor, Town Hall, Wednesbury.

Whalley (Lancaster).—Asylum (359,500*l.*); Messrs. Parkinsons, Ltd., builders, Kent-road, Blackpool.

Willington Quay.—Additions to works for Messrs. Hood, Haggie, & Son, rope manufacturers.

Woodhouse.—Mining institute; Mr. J. Hutchings, County Architect, Stafford.



Wyke.—Buildings for Messrs. Roby & Edgar, worsted spinners, Wyke Mill.

Ystradowen.—School; Mr. V. Morgan, architect, Spelman-street, Carmarthen.

* See also our list of Competitions, Contracts, etc., on another page

PICKETS AND TRADE DISPUTES.

It is stated that on behalf of members of the London Master Builders' Association a petition has been presented to the Prime Minister praying for legislation limiting the number of pickets during trade disputes to two.

The London Opera House: Cast-Bronze Grillage to Entrance Door.

THE LONDON OPERA HOUSE.—III.

Electrical Installation.

THE electrical equipment of the Opera House was installed by Messrs. Malcolm & Allan, Ltd., of Kingsway House, W.C., under the direction of the consulting electrical engineer, Mr. F. J. Humphrey, of 39, Charing Cross-road, the interior fittings having been specially design by Messrs. Veritys, Ltd.

Current is supplied by the Charing Cross, West End, and City Electricity Supply Company and the Metropolitan Electric Supply Company. In each case the supply is in the form of continuous current at 200 volts pressure.

The Charing Cross Company furnish current to the main stage switchboard for stage and part of the general lighting, and to one of two other switchboards at the front of the house.

The Metropolitan Company supply current to switchboards on the stage for power, heating, and special effects, to the dressing-rooms switchboard, and to the second switchboard at the front of the house.

For lighting purposes the three-wire system has been adopted, giving a potential difference of 100 volts between the outer conductors and the middle wire, while the power and heating circuits are on the two-wire system at 200 volts pressure.

The main switchboard for the stage, on the "prompt" side, is at some height above the floor, and enables the attendant to obtain a view of the entire stage. The switchboard comprises four circuit panels and one panel for "black-out" switches, rapidly cutting out the stage and auditorium lights controlled from this point.

The four panels mentioned control seventy-eight circuits with the aggregate capacity of 1,500 amperes, all connexions being placed on the front to comply with the regulations of the London County Council.

Of the seventy-eight circuits, twelve supply stage arc lights, thirty-two are ordinary stage circuits with "dimming" resistances, twenty are auditorium circuits also with "dimming" resistances, and fourteen are stage general lighting circuits. The regulators for the dimmers are on the same platform as the panels, and the resistances are placed directly above on an iron and teak platform.

For the lighting of the dressing-rooms twenty-four circuits are provided from a switchboard near the stage entrance.

The stage lighting system includes about 2,300 metallic filament lamps in eight battens of 200 lamps each—white, red, blue, and amber. The battens of lamps are suspended over the stage, and their height can be regulated as desired by means of hand winches. The footlights include 250 lamps in four colours, and the proscenium is illuminated by fifty lamps in three tints. Among special lighting arrangements for scenic purposes there are fourteen lines of twenty-four lamps, six bunches of twelve lamps, and numerous wall-plugs for arc and incandescent lamps. In addition there are six arc-lamps for lightning effects, all controlled by a special switch at the "prompt" side, and eight projecting arc-lamps with scissor shutters for sunrise, sunset, rainbow, cloud, storm, and waterfall effects.

Illuminated signal-boards are fitted in the flies and "prompt" corner, all controlled from a twelve-switch operating board for the use of the stage manager.

The power installation includes two 100 ampere circuits, one for ventilating-fans and the other for a deep-well pump and a 25-ampere circuit for power on the stage. The main switchboard for these circuits is situated in the intake chamber.

Circuits for general lighting proceed from two switchboards placed at each side of the main entrance. One board controls thirty-seven circuits and the other seventy-eight circuits.

One of the most interesting features of the auditorium and other public departments of the house is the reflected system of diffused light, to which the lights attached to exposed electroliers and other fittings serve the auxiliary purpose of furnishing more brilliant local illumination.

Suspended from the ceiling of the auditorium, a large centre fitting of circular form contains 400 lamps with reflectors. This fitting weighs 1 ton, and can be lowered to the stalls floor for lamp renewals, cleaning, or repair. The other exposed lights are placed on electroliers, pendants, flambeaux, and brackets.

The verandah over the foot-pavement in Kingsway is lighted by some 300 lamps, and other high candle-power lamps are employed for the exterior illumination of this building.

To provide a reasonable safeguard against the risk of interrupted service the dual system of lighting has been applied in every part of the house, so that if a temporary breakdown should occur in one source of supply the circuits served by the other source would still furnish ample light.

More than 5,000 incandescent metallic filament lamps are included in the lighting installation, which is one of the best examples of the kind in the metropolis.

The switchboards, cables, wires, and reflectors were made by Messrs. Siemens Brothers and Co., Ltd., and Messrs. Malcolm & Allan supplied their special wiring boxes in connexion with the screwed, solid drawn-steel conduit tubes through which the wires are drawn on the looped-in system. The wrought-iron brackets for lamps on the

terior of the building were made by Messrs. T. W. Vaughan & Co., Ltd. (late Vaughan & Brown).

Heating and Ventilation System.

The warming and ventilation of the building is effected partly on a modification of the plenum system and partly by means of direct radiators and exhaust fans, the whole of the work having been carried out by Messrs. Goode & Co., of Osnaburgh-street, N.W.

Steam for both parts of the installation is generated at 5 lb. pressure and reduced to atmospheric pressure for use in radiators through which and the service mains it is circulated by means of pumps.

For warming and ventilating the auditorium, air drawn from the exterior is forced through a steam-heated battery by means of a 40-in. diameter air blower of the enclosed pressure type, and after having been filtered and washed is distributed through openings in ducts below the level of the stalls floor. Small branch ducts of concrete or galvanised iron with outlets in the stalls, box tier, grand circle, lower gallery, upper gallery, and all other parts of the house open to the public.

Instead of relying upon the main blowing-in for the ejection of vitiated air from the building as in the plenum system properly so called, auxiliary exhaust fans are employed, placed in the roof of the auditorium and two others for the extraction of air from the entrance hall and other apartments of the same part of the house. Thus the result is a combination of the plenum and exhaust systems of ventilation, and has the advantage of providing very effectively for the removal of vitiated air. The installation is capable of maintaining a temperature of about 70° in the auditorium. The stage and various rooms in the same part of the building are warmed by means of steam-heated radiators applied without mechanical ventilation. The steam generating plant is also employed for heating water in calorifiers for the hot water services to the dressing-rooms and elsewhere.

Artesian Well.

Following the example which has been set by the proprietors of numerous important buildings in London in consequence of the excessive rates demanded under the rateable value basis of charges, Mr. Hammerstein has sunk an artesian well of 7 in. internal diameter to the depth of 460 ft. 5 in. below the surface, and is thus enabled to obtain a supply of 3,000 gallons per hour if required at exceedingly moderate cost.

The well was sunk by the Artesian Well Boring Company, of Pentonville, and passes through the following strata:—Basement 3 ft., made-up ground 3 ft., gravel 5 ft., brown clay 1 ft., London clay 19 ft., sandy blue clay 2 ft., London clay 91 ft., mottled clay 25 ft., black clay 4 ft., mottled clay 4 ft., pebble bed 4 ft., brown sands and pebbles 5 ft., green sands 30 ft. 6 in., Thanet sand and flint 2 ft., chalk and some flints 247 ft. 11 in., making up the total depth of 460 ft. 5 in.

Artesian Well Boring Plant.

The standing water level is 220 ft. below the surface, and water is raised by means of the air lift system.

We are informed that examination by an eminent analyst shows the water to be of great purity organically, it being almost free from salts of lime or magnesia, and containing sodium salts in notable proportion.

Conclusion.

The general building contractors were the Building Construction Company, Ltd., of Cockspur-street, S.W., and Mr. G. Sheen was the clerk of works. In addition to the plaster-work executed by Messrs. J. Tanner & Son, the fibrous plaster decoration of the auditorium was carried out by Messrs. A. R. Dean & Co., of Birmingham, and the fire-resisting partitions throughout were supplied by Messrs. A. & S. Wheater, of Stoke Newington. Ornamental bronzework, including the handsome entrance grilles, was manufactured by Messrs. T. Brawn & Co., of Birmingham, and Messrs. T. W. Vaughan & Co., Ltd., of Islington, supplied brass rails and the exterior torch brackets. The whole of the sanitary fittings were provided by Messrs. John Jones, Ltd., of Chelsea, and the wood-block flooring was laid by the Acme Flooring and Paving Company, of Hackney. Mr. F. G. Minter, of Putney, was responsible for the joinery work, and Messrs. Hammond & Champness, of Old Kent-road, supplied the goods lift for the stage department. The foregoing names, as well as those of specialist firms previously mentioned, serve to suggest the enormous mass of details which had to be considered by the architect in addition to the artistic and structural features of this important building.

Fig. 1. Small Section Kahn Bar.

Fig. 2. Large Section Kahn Bar.

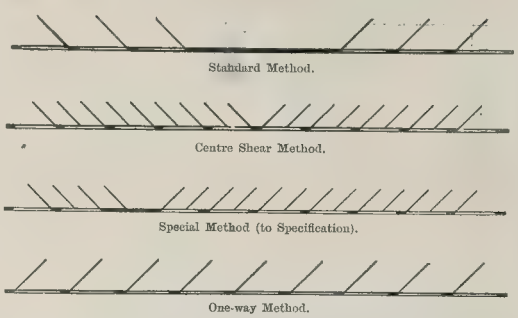


Fig. 3. Various Shearings of Kahn Bars.

REINFORCED CONCRETE IN GREAT BRITAIN.—IV.

BY W. NOBLE TWELVETREES.

(*Continued from page 332.*)

Systems of Class (b).

AS PREVIOUSLY stated, most of the firms supplying special forms of reinforcement are prepared to supply designs for the application of their specialities, exactly in accordance with the practice of firms whose systems come under Class (a), and it should be noted that the general arrangement of the reinforcement is usually similar to the arrangements adopted by designers who make use of ordinary commercial bars and forms of steel. As in the case of systems under Class (a), we deal with the various systems now to be considered as far as possible in the order of their introduction in this country.

Kahn System.—This system was originated in 1903 by Julius Kahn, of Detroit, U.S.A., and was largely adopted in the United States and Canada before its introduction here in 1906. The English company was formed in March, 1907, under the style of the Trussed Concrete Steel Company, Ltd., with offices at Caxton House, Westminster.

The British patent granted to Mr. Kahn, in 1903, was amended in the same year in accordance with the decision of the Comptroller-General of the Patent Office. The amended specification contains a large number of claims which we need not mention individually. Therefore, we summarise briefly the main features of the invention, which has for object "the obtaining of trussed members in which a part of the truss consists of metal of novel construction and arrangement, and the remaining part of the truss either in integral cementitious substance or a plurality of blocks. It is the further object of the invention to obtain

the maximum of strength with the minimum of metal by so constructing and arranging the metallic part that the main body and arms thereof will lie in the direction of and along the lines of the tension stresses, while the body material . . . . will resist the compression stresses."

Fig. 1 is a perspective view of the Kahn bar as usually sheared for beam construction, the diagonals alternating on each side of the bar, the diamond section shown being that of the ½-in. and small ¾-in. beam bar. Larger sections are rolled, as in Fig. 2. It will be seen that flanges extend on either side of the body; these are sheared with L-shaped cuts so that strips may be bent up to form diagonal shear members being rigidly attached and part of the main tension member. This is the distinctive feature of the Kahn bar. Various types of shearing are shown in Fig. 3.

Kahn bars are produced in the following standard sizes:—

Dimensions of Body.	Thickness of Wings.	Overall Width.	Weight per Foot.
	In.	In.	Lb.
½ in. square	¼	1¼	1·4
¾ in. ,, ...	5/16	2⅛	2·7
1 in. irregular	⅜	2⅝	4·8
1¼ in. ,, ...	½	3¼	6·9

The Kahn bar can be used equally well in beam, cantilever, lintels, and in floor construction both of solid and tile type.

Fig. 4 represents a typical method of using the bars in beams and floors. In the case of continuous beams and slabs, inverted bars of suitable length are placed in the upper part of the member over the intermediate supports, the above members of diagonals pointing downward. These are termed continuity bars, and provide for negative bending moments.

A similar arrangement is adopted where steel is required to assist the concrete in compression, the inverted bar lying in the area of compression, while the upward and downward diagonals inclined at an angle of 45 deg. form a latticed web.

Fig. 5 illustrates the adaptation of the Kahn bar to hollow tile floors, the reinforcement being embedded in wide concrete joints between rows of hollow tiles, the main beams being as already described. This type of floor can be used in spans up to 36 ft. without secondary beams, thus giving a flat soffit over large areas.

Column footings are reinforced by two series of bars crossing each other at right angles as illustrated in section and plan by Fig. 6.

The advantages claimed for the Kahn trussed bar are the following:—

(1) That the shear members are rigidly attached in accordance with theoretical requirements, thereby obviating the risk of misplacement or omission.

(2) That the diagonals, bent up to 45 deg., intersect the planes of both horizontal and vertical shear.

(3) That the bar is economical, as the shear members are cut out of surplus steel and the middle third of the bar being unsheared the flanges are available for resistance to tens stress where necessary.

(4) That the labour of shaping, fixing, a holding the bars in position while the concr is placed is eliminated.

The Trussed Concrete Steel Company, Lt supply another type of reinforcement in t form of a mechanical bond bar known as t Kahn Rib Bar, illustrated in Fig. 7. T differs from some deformed bars in that t metal has not been distorted from a straig line, and it is claimed that whereas distort bars previously used waste some 25 per ce of metal, the loss of section in this bar is r more than 5 per cent., as the only mater lost is that in the transverse ribs. The b is rolled in sizes from ⅜ in., rising by ⅛ in. to 1½ i the cross-sectional area corresponding with t area of a square bar of the same designatio Bars of this type are used for vertical and pa reinforcements, and can be applied to a system of reinforcement. Where applied columns the vertical bars are bound w steel of round or flat section.

Fig. 8 illustrates the Kahn Hy-Rib sheeti manufactured from single sheets of steel so as form a steel lath surface stiffened by fold projecting ribs. Applied vertically it obvia the use of studding, and used horizontally saves the cost of centring. This type of re forcement is applicable to the construction floors, roofs, walls, partitions, and kind structures. In floors and roofs it is used conjunction with reinforced concrete or oth beams, and itself forms centring for the depo tion of concrete. In walls and partitions it

ILLUSTRATIONS TO KAHN SYSTEM OF REINFORCED CONCRETE.

place and rendered in cement, the rigid making studs unnecessary. Clips and plates are supplied, as well as cutters and es to facilitate operations.

products of the Trussed Concrete Steel any are supplied at rates which cover royalties, specifications, and detailed ng drawings. No charge is made for s, providing the Kahn system is specified given work. All types of reinforcement by the company are sold freely to builders thers: there are no licensed contractors, special contractors are not necessarily yed.

Piketty System.—Messrs Paul Piketty o., 14, 16, and 18, Bloomsbury-, W.C., write us that in the article on system, in our issue of last week, no on is made as to their patent method ncreasing the limit of elasticity of ry mild steel intended for use as ls and stirrups, by stretching, so as to the quality of a higher steel resistance en the limit of resistance of elas- thus procuring a higher tension esistance at the price of ordinary mild By this means all the resistance that etal is able to give between the limit sticity and the limit of resistance is d, with the advantage that any crack- concrete can only be reached in the stresses.

(*To be continued.*)

BOOKS.

es on Cement. By BERTRAM BLOUNT, C. (The Institute of Chemistry of nt Britain and Ireland. London: 1912. 64. 2s. 6d.)

ectures delivered by the author at College last year, and now issued in let form, deserve to be in the hands ement-users and architectural students. an historical outline of the evolution aceous cements, the author discusses emical reactions and physical changes ing in the production and setting of s, modes of testing, and the standard- of tests, which are necessarily of ry character. A particularly service- art of the pamphlet is that where on is drawn to the errors that may n consequence of the unintelligent use ents, the causes of failure in cement ures, and the importance of discrimi- in the selection of aggregate employed ing mortar and concrete. The pam- concludes with four appendices, two ng to analytical methods, and the last rising certain significant clauses of the standard specification for Portland

lay Uses of Portland Cement. Second ion. (Published by the Associated land Cement Manufacturers (1900), London. Pp. 348. Paper covers, d.; stiff covers, 2s. 6d.)

UGH published by a manufacturing ly, this exceedingly useful and inter- book is fully equal in literary and al merit to many of the treatises on e and reinforced concrete now so ul. The information conveyed as to nposition, preparation, and deposition rete, the construction of moulds, con- block practice, and other matters is ully selected and expressed, and the ted examples of the uses of concrete robably lead many readers to make ed employment of that excellent ral material.

bique Ferro-Concrete: List of Works uted in the United Kingdom. 1897-1911. nd Edition. (Published by L. G. hel & Partners, Westminster. Pp.

pamphlet brief particulars are given than a thousand ferro-concrete struc- n the British Isles, together with the of the persons or authorities for whom ere built, and of the architects or rs responsible. The list, which is d in counties and districts, ought to reat convenience to architects desiring ect works carried out on the system concerned. Most of the structures mentioned in the pamphlet relate to building construction, but it is interesting to note that the list includes some 100 reservoirs and tanks, eighty wharves, jetties, and quays, and 100 highway and other bridges. Bearing in mind the large number of reinforced concrete works executed on the many other systems now available, it is evident that the new method of construction has been very widely adopted in the United Kingdom.

The Clayworker's Hand-Book. By ALFRED B. SEARLE. Second Edition. Thirty-two Illustrations. Revised and rewritten. (London: Charles Griffin & Co., Ltd. 1911. Pp. 416. 6s. net.)

SINCE publication of the first edition of this work considerable developments have taken place in the clayworking industries, and much additional information on the subject has been accumulated. The objects of the author are to make clear the characteristics of the various materials used, to explain the operations of obtaining and preparing the clay, and to describe manufacturing processes in such manner as to enable the clayworker to secure the most satisfactory work possible out of the machinery and plant available. These aims have been carried out in a thorough and essentially practical manner, and in its revised form the book should gain fresh popularity among the class to whom it is addressed.

British Clays, Shales, and Sands. By ALFRED B. SEARLE. With ten plates and fifty-three figures in the text. (London: Charles Griffin & Co., Ltd. 1912. Pp. 451. 7s. 6d. net.)

THE chief purpose of this book is to set forth in proper order the characteristics of the clays, shales, and sands occurring in the United Kingdom, together with information as to the localities where they are to be obtained in remunerative quantities. The attempt has not been made to describe the beds in question with the minuteness of a geological survey, but the author has evidently made a point of denoting, as far as possible within the limits of a relatively small volume, the areas where deposits of present or future commercial value may be found. The practical utility of such a book becomes evident when it is remembered that in most geological works palæontology receives far more attention than the more mundane considerations which lead clayworkers and other industrial classes to study geology. The task undertaken by the author has obviously involved an immense amount of labour, and he is to be congratulated on the encyclopædic collection of data now placed at the disposal of industrial firms and professional men interested in deposits of the kind indicated by the title of his new book.

Simple Calculations for Sanitary Officials and Students. (London: The Sanitary Publishing Co., Ltd. Pp. 34. 1s. net.)

THESE calculations are so very simple that we are a little inclined to wonder why it should be necessary to publish them. They relate chiefly to the computation of area, volume, the flow of water, and other elementary arithmetical operations. Those who require guidance in such work will find this little book all that can be desired.

Report on the Gypsum Deposits of the Maritime Provinces. By WILLIAM T. JENNISON, M.E. (Ottawa: Government Printing Bureau. 1911. Pp. 171.)

PREPARED for the Canadian Department of Mines, this report is in the form of a monograph on the gypsum deposits of Nova Scotia, New Brunswick, and the Magdalen Islands. By description, photographs, and maps, it shows the vast extent of the deposits, the processes and cost of manufacturing commercial gypsum, and the uses of the material. The report makes interesting reading matter and is of special value to all engaged in manufactures involving the employment of gypsum products.

Theory and Practice in Designing. By HENRY ADAMS, M.Inst.C.E., late Professor of Engineering at the City of London College. (London: Constable & Co., Ltd. 1911. Pp. 240. 6s. net.)

PROFESSOR ADAMS has written many helpful books on the design of structures, and the present work comes under the same category, although intentionally or inadvertently the title does not indicate what kind of designing is discussed.

As a text-book the treatise may be taken up by the mere beginner, for everything is explained in perfectly clear language, and the text is unencumbered by complicated mathematical formulæ. Moreover, it ought to be found of practical utility as a book of reference to architects and engineers engaged in structural design. The subjects treated include the design of beams, columns, roofs, steel-framed sheds, bridges, arches, and retaining walls. Steel preponderates as the material of construction, but timber, cast-iron, and stone also find a place in various chapters. The illustrations throughout are prepared from drawings and form a valuable feature of this useful work.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W. Captain G. S. Swinton, Chairman, presiding for the last time prior to his departure to India as a member of the Delhi Town Planning Committee.

LOANS.—The Finance Committee recommended and it was agreed to make a loan of 8,768*l.* to the Battersea Borough Council for an electricity generating plant; and a loan of 14,029*l.* to the Hackney Borough Council for improvements.

NEW SCHOOL.—It is proposed to erect, if necessary, a new school to accommodate 768 children on the Victory-place site, Bermondsey, and to enlarge the Paragon School, Bermondsey, to provide accommodation for an additional 240 children.

GREENWICH PIER.—It was recommended by the Highways Committee that owing to the condition of the river berth in front of the pier at the Greenwich generating station it was desirable to make an efficient and stable berth by driving a row of piles along a portion of the frontage and to lay concrete and chalk up to the piles to make a level bed.

LEGAL COLUMN.

Workmen's Compensation.

Some curious accidents have come to the notice of the Courts under the Workmen's Compensation Act, of which the recent case, Peel *v.* William Lawrence & Sons, Ltd., furnishes an example. A man employed in a cotton mill sprained a tendon of his finger whilst removing one of his socks. It is common knowledge that such accidents will sometimes occur in performing some quite simple and ordinary daily operation, but the question for the Court was whether the man was entitled to compensation from his employers.

It appeared that the men, for their own convenience and possibly even to render themselves more efficient, were in the habit of removing their socks; but the Court of Appeal has held that there was no special risk of such an accident incidental to the employment, and therefore the accident did not arise out of the employment. The accident happened ten minutes before actual work commenced, but as the man was preparing himself for the work this did not affect the case, as had the accident been connected with the employment it would have arisen "in the course of it."

There is a legal axiom, *de minimis non curat lex*, but under the Workmen's Compensation Act the law has to take notice of trivial incidents, as a considerable sum in compensation may arise out of them. A man may snap a tendon on his leg whilst merely walking, or he may strain his finger in undressing; if he is ascending a particular ladder, or if he is

assuming a dress necessary to his employment, very awkward questions may arise as to the connexion between the accident and his employment.

Patent Law.

In the case *re* Taylor's patent, recently tried before Mr. Justice Parker, the working of sect. 27 of the Patents Act, 1907, had to be considered. The patent in question related to mechanical underfeed "stokers," and on the application of the Erith Engineering Company the Comptroller had made an order under sect. 27 for its revocation. The owners had acquired the patent in 1908, and, even before assignment, had advertised it here and written to engineering firms about it. There was, however, in this country a patent, Daley's patent, now in the hands of the Erith Company, and in America there were two patents, one corresponding to Taylor's patent (that which had been revoked), and another corresponding to Daley's patent, and in 1909 there was litigation in the United States, and it was decided that Daley's patent was the master patent, and it was therefore admitted that Taylor's patent could not be worked here without infringing Daley's patent. Then the owners ceased further to exploit the patent.

The position, therefore, was this:—The only persons who could enable Taylor's patent to be worked here were the owners of Daley's patent, who were applying for its revocation. If they had granted a licence under their patent they could not subsequently take proceedings under sect. 27; but they contended that the owners of Taylor's patent should have applied under sect. 24 for a compulsory licence.

The Court held that the applicants for revocation had made out a *prima facie* case under sect. 27, but the owners of the patent had rebutted it by showing that the only persons who could enable it to be worked were the applicants themselves, and the non-application for a voluntary or compulsory licence was not in the circumstances of this case a sufficient reason for revoking the patent.

LAW REPORT.

West Kirby Sailing Club: County Court Case.

At the Birkenhead County Court on the 15th inst. his Honour Judge Yorke Stanger gave judgment in the case of Messrs. E. F. Blakeley & Co., engineers, of Liverpool, who sued the West Kirby Sailing Club for 87*l.* 15s. 9d. in respect to the erection of the clubhouse supplied to the defendants.

Mr. Layton (instructed by Messrs. Oliver Jones, Billson, & Co.) represented plaintiffs, and Mr. A. R. Kennedy (instructed by Messrs. Simpson, North, Harley, & Co.) was for defendants.

The case was partly heard in December last, when it was said by Mr. Layton that his clients were a firm of engineers. The defendants were respectively President and Commodore of the West Kirby Sailing Club.

On the suggestion of his Honour, the case was adjourned and sent to an arbitrator, Mr. Henry Hartley, architect and surveyor, of Liverpool. The arbitrator found that defendants were due to pay to plaintiffs 60*l.* 10s. 8d. for extra work and material supplied, and that plaintiffs were due to pay to defendants the sum of 63*l.* 2s. 10d. on account of defective material and workmanship, inasmuch as the weather boarding supplied was not weather boarding, the internal lining boarding was not seasoned timber, and was not properly fixed, the sills of window casings were defective, also the floors were uneven for want of proper footings to the brick piers supporting the building.

His Honour was of opinion that the action was one which should never have been brought into Court.

He gave judgment for defendants with the general costs on Scale C

LONDON COUNCILS.

Barnes.—An offer to give up land for road widening off Temple Sheen-road has been accepted by the Council, and kerbing and channelling works are to be carried out at an estimated cost of 160*l.* Plans by the Surveyor have been approved for making-up Washington-road.

Barnet.—At the last meeting of the Barnet Hospital Committee Mr. Pill, of Messrs. White, Son, & Pill, was appointed architect in connexion with extensions to be carried out to the isolation hospital. The estimated cost of the work is put at 3,000*l.*

Croydon.—The tender of Messrs. W. Smith & Sons, London-road, at 14,493*l.*, has been accepted for the erection of the boys' school.

Ealing.—For making-up a portion of Midhurst-road, West Ealing, with indurated Victoria stone, the tender of Messrs. Clements, Knowling, & Co., at 627*l.*, has been accepted by the Town Council.

Lambeth.—During the ensuing year repairs are to be carried out in various roads throughout the Borough at an estimated cost of 18,371*l.*

Richmond.—Wood-paving is to be laid in Kew-road at an estimated cost of 20,500*l.*, which sum includes relaying a part of the existing kerbing.

Shoreditch.—Electricity mains are to be extended in the Bethnal Green area at an estimated cost of 230*l.* Westmoreland-place is to be opened up into Murray-street by the demolishing of Nos. 48-50, Murray-street. The cost of the whole work, including paving, etc., is put at 1,800*l.*

Southwark.—The tender of Mr. W. Vanstone, 61, Chandos-street, Strand, W.C., at 523*l.*, has been accepted for carrying out alterations and decorations at the Central Library.

Stepney.—The tenders of Messrs. Ashby & Horner, at 410*l.* and 354*l.*, have been accepted for carrying out redecorations and structural alterations, and supplying fittings respectively at the Mile End Library; as has also the tender of Messrs. J. H. Sankey & Son, Ltd., for the annual supply of Portland cement, at 1*l.* 8s 11d. per ton.

Thames Ditton.—Imber Park-road is to be made up at an estimated cost of 901*l.*

Tottenham.—The following tenders have been accepted by the Urban District Council:—Mr. E. T. Bloomfield, Tottenham, at 131*l.* and 127*l.*, for making-up Castle Wood-road and Moundfield-road respectively; Mr. J. Adams, Wood Green, at 105*l.*, for making-up part of Holcombe-road; Mr. E. Knifton, Edmonton, at 385*l.* 3s. 3d., for making-up the remainder of Hampden-road. Plans have been passed for Mr. F. Brooking, 4, St. Anne's-road, for the erection of three shops and houses in High-road; also for Messrs. Brand, Pettitt, & Co., for the erection of a garage at the rear of 200, High-road. Mr. H. S. Couchman has lodged plans for the erection of a shop and warehouse in Bruce-grove.

Wandsworth.—That part of Upper Richmond-road, Putney, between Priory-lane and Priests'-bridge, is to be paved in three sections:—(1) With Cormastik road material: (2) with Durax armouring; and (3) with granite macadam with Plascom binding material. For carrying out the work of sections 1 and 2, the tenders of the British Trust Corporation, Ltd., and the Durax Dustless Roads, Ltd., have been accepted at 5s. and free maintenance for three years, and 7s. 5d. and free maintenance for five years, respectively. The work for the third section is to be carried out by the Borough Engineer at an estimated cost of 4s. per yard super. Tenders are to be invited for flagging the footway of a portion of Upper Richmond-road. A 12-in. pipe sewer is to be constructed in a portion of Wimbledon Park-road, Southfield, at an estimated cost of 360*l.* The tender of Mr. Thomas Adams, at 687*l.*, and schedule prices for extras or omissions, has been accepted for paving Normanhurst-road, Streatham; as has also the tender of Mr. J. Mears, at 230*l.*, and schedule prices for extras or omissions, for paving a portion of Upper Richmond-road, Putney. In both cases the footways are to be paved with Aberdeen adamant. Plans have been passed for Messrs. Swain & Selley for the erection of eight shops in Upper Tooting-road, also for Messrs. Holliday & Stanger for fourteen houses in Woodbourne-avenue, Streatham.

West Ham.—Portions of Saville-road and Leonard-street are to be made up as new streets. The following plans have been passed:—Messrs. F. & F. J. Wood, additions to offices, at Messrs. Suter, Hartmann, & Co.'s premises, Silvertown; Messrs. Clemens Brothers, four houses, Capel-road, Forest Gate; Mr. W. Sweetingham, alterations and additions to cinematograph hall, Rathbone-street, Canning Town. Plans have been lodged by Messrs. W. & T. R. Milburn, Mr. S. Knight, and Mr. F. Parnell to erect a workshop and store at the rear of the Empire Theatre, Broadway, Stratford; to adapt the Salisbury Hall, Romford-road, Stratford, as a cinematograph theatre; and to make alterations to the cinematograph theatre, Adamson-road, Custom House, respectively. The Education Committee have approved plans prepared by the Architect for the erection of two schools and a handicraft centre, and for the enlargement of the Water-lane and Harold-road handicraft centres.

Westminster.—The north-east corner of the garden enclosure in Parliament-square is to be rounded off at an estimated cost of 130*l.*

OBITUARY.

Mr. F. W. Albury.

The death, on March 23, at Parkside, Re[ading], is announced of Mr. Frederick Willi[am] Albury. Mr. Albury was elected in 1866 Associate, and in 1875 a Fellow of the Ro[yal] Institute of British Architects. In Februa[ry] 1910, he took into partnership Mr. H. Whi[te]man Rising, F.R.I.B.A. (1903), of Norfo[lk] street, Strand, and also his old pupil [and] friend, Mr. E. P. Morgan, who had been his office for the past twenty-five years, un[der] the style of Messrs. Albury, Rising, & Morg[an] of No. 154, Friar-street, Reading, [and] Oswaldestre House, Norfolk-street, Stra[nd] W.C. In 1907 Mr. Albury was nominated a competition, limited to three architects, submit designs for the public library [and] reading-rooms in Oxford-road, West E[nd] Reading, and his designs, in the Renaissa[nce] manner, were chosen. The building is of brick with oolitic stone dressings, with a m[ain] frontage of 120 ft., erected by Messrs. Kingerlee & Sons, of Oxford, at a cost nearly 4,000*l.*, and all the public rooms upon the ground floor. He was the archit[ect] of the Palmer Memorial Building and T[em]perance Institute in West-street, built by Whiting on a contract for 4,750*l.*; A. H. Bull's premises in Broad-street; Saviour's Church Sunday-schools; and, Mr. George W. Webb (1898), of the Wellington Club, Reading. The funeral was fixed Thursday, 28th inst., at Christchurch, Whit[ley] Reading.

FOREIGN AND COLONIAL.

Y.M.C.A. Buildings, Toronto.

With reference to the notice on p. 279 the *Board of Trade Journal* of February 1911, relative to the proposed construction a new central building for the Young M[en's] Christian Association at Toronto, the Imper[ial] Trade Correspondent at that place (Mr. F. Field) reports that the plans of the propo[sed] building, the cost of which is estimated 529,000 dollars (about 109,000*l.*), have now b[een] approved. Some further particulars regard[ing] the construction and furnishing of the bu[ild]ing, together with a plan, may be seen, the name and address of the firm of archite obtained, by British manufacturers at Commercial Intelligence Branch of the Bo[ard] of Trade, 73, Basinghall street, London, E.C.

Building in Servia.

The *Nachrichten für Handel* (Berlin) February 26 announces that proposals allocating the following sums for the purpo[ses] indicated have been discussed in the pres[ent] session of the Skupschina:—800,000 din[ars] (32,000*l.*) for University requirements, inc[lud]ing the erection of a building for the techn[ical] section; 400,000 dinars (16,000*l.*) for the b[uil]ding of a national library; a subsidy 200,000 dinars (8,000*l.*) for the erection building for the Academy of Science. T following further grants have also been p[ro]posed:—250,000 dinars (10,000*l.*) for the erect[ion] of a gymnasium and 750,000 dinars (30,00[0] for other school requirements. From Sanitary Funds are allocated:—1,600,000 din[ars] (64,000*l.*) for a lunatic asylum, 1,245,000 din[ars] (49,800*l.*) for the completion of the pu[blic] hospital in Belgrade, 2,800,000 dinars (112,00[0] for the erection of a hospital in the inte[rior] of the country, and 700,000 dinars (28,000*l.*) i[mp]improvements at three Servian Spas.

Roadmaking, Building Construction, etc., Congo State.

With reference to the notice on p. 68 of the *Board of Trade Journal* of January 11 relat[ing] to the Congo State budget expenditure [for] 1912, it is notified that the *Moniteur Be[lge]* (Brussels) of March 16 contains a decree [ap]proving an extraordinary expenditure 42,419,103 francs (about 1,696,800*l.*) in Congo State during 1912. It may be not[ed] that, *inter alia*, that 18,983,000 francs (ab[out] 759,300*l.*) have been earmarked for pu[blic] works, such as road-making, building constr[uc]tion, establishment of telegraph lines, sanit[ary] work, etc., and 1,700,000 francs (about 68,00[0] for the establishment of wireless telegra[phy] stations.

Contractions used in these lists.—**F.g.r.** for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; p. for possession; e.r. for estimated rental; w.r. for weekly rental; q.r. for quarterly rental; y.r. for yearly rental; u.t. for unexpired term; p.a. for per annum; yrs. for years; la. for lane; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; av. for avenue; gdns. for gardens; yd. for yard; gr. for grove; b.h. for beerhouse; p.h. for public-house; o. for offices; s. for shops; ct. for court.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

*** Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Fuel Cost and Heating Efficiency.

The large increase in the price of fuel greatly accentuates the importance of extracting the full calorific value from the coal or coke used for heating purposes—a matter closely affecting the owners and occupiers of all classes of office buildings, factories, shop premises, and private houses.

IDEAL & IDEAL RADIATORS & BOILERS

For warming houses, flats, hotels, shops, public buildings, etc. by hot water or steam.

The economy of central heating is now generally admitted, but the selection of suitable appliances for the generation and distribution of the heat requires careful consideration if the best results are to be obtained.

The specification by Architects and Engineers of Ideal Boilers and Ideal Radiators for Low Pressure Hot Water and Steam Systems ensures the use of a product which is based on scientific knowledge and more than 30 years' experience—a product made from the best materials, enjoying a world-wide reputation for reliability, efficiency, adaptability, and simplicity of design, construction, and operation.

If you have not our current catalogue we shall be pleased to send a copy gratis and post free.

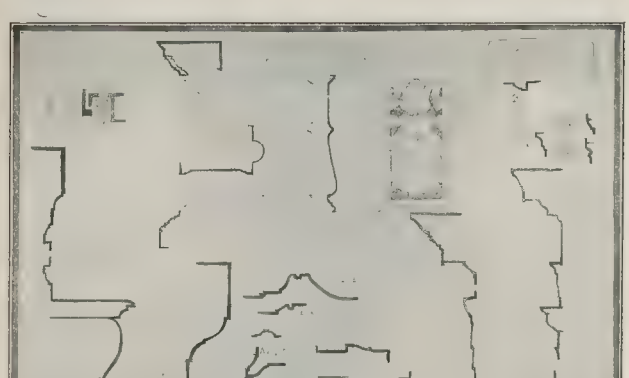
THE VILLA PIA, ROME. DRAWN BY MR. C. A. HARDING.

HEADQUARTERS FOR THE TERRITORIAL FORCE ASSOCIATION, NOTTINGHAM. MESSRS. BREWILL & BAILY, FF.R.I.B.A., ARCHITECTS.

DESIGN FOR ALMSHOUSES, NOTTINGHAM, FOR THE WILKINSON SMITH TRUST. MESSRS. BREWILL & BAILY, FF.R.I.B.A., ARCHITECTS.

St. Peter's from the Villa Pia.



A PAPAL PLEASURE HOUSE.

ON the eastern side of the Vatican Palace in an angle of the ground is situated the "little wood of e Belvidere," as Vasari terms it, rising ntly at first and then more steeply the upper gardens and observatory, d in this wood is situated the subject this article.

The Villa Pia, or the Casino del Papa, as commenced in the year 1560, on the iers of Pope Pius IV. (Medici), and on completion, a year later, was used by n as a place of retirement in the warm ghts, where he used to converse with s nephew, S. Carlo Borromeo.

The architect was Pirro Ligorio, a eapolitan, who seems to have been person of importance at the Vatican. man of distinguished family, he had studied deeply from the remains of the antique, especially of the villas of the Romans, and was the author of several works on antiquity. He was first employed about the Vatican by Pope Paul IV. (Carrafa), having been recommended to him as worthy of employment on St. Peter's, and under this Pope he endeavoured to oust Michelangelo from his work on St. Peter's: indeed, according to Vasari, ventured to remark that the great Buonarroti had reached his second childhood. He was finally dismissed to make room for Vignola, and died in 1583. Among other works he designed the Villa d'Este at Tivoli (1549) for Cardinal Ippolite d'Este, afterwards Clement VIII., who had been appointed Governor of Tivoli.

The Villa Pia is the outcome of Ligorio's studies in the antique, and is said to have been an imitation of ancient villas, but the Renaissance architect of the best days was not bound to imitation, and the idea of reproduction did not enter his mind. His work was rather the result of the impression he had received while studying, expressed in his own way and tempered by his own character. Most of the materials of which it is constructed came from the Stadium of Domitian. Unfortunately, the original setting has disappeared, and the gardens, especially the lower portion, are much neglected. A view engraved by Falda in 1670, and reproduced in Triggs' "Art of Garden Design in Italy," shows the scheme as then existing, but of these gardens

The Villa Pia, Rome : Details.

there are now only a few overgrown paths and one small weed-covered pool.

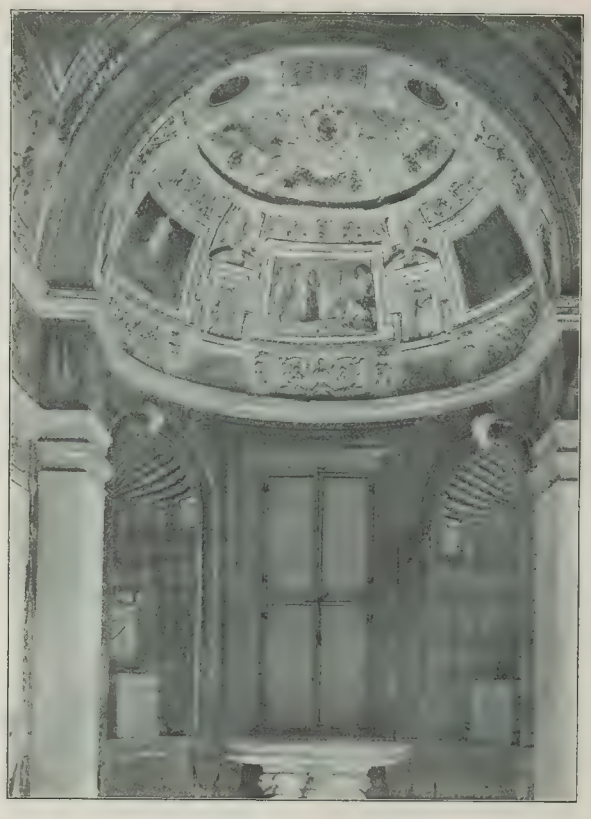
An examination of the plans will show that the scheme consists of an elliptical court with the major axis running, approximately, east and west, with two buildings placed on the minor axis; the southern is a two-storied casino, and the northern, a loggia, with a lymphæum and water-chamber below. At the east and west are two small arches with gates, which close the court. Owing to the slope of the ground the casino is surrounded on the south by an area to keep off the water, and the lymphæum below the loggia rises out of a pool on a lower level, access to which is obtained by staircase ramps on either side of the courtyard, starting outside the archways and terminating in the lower garden. This is a rough semi-ellipse in form, with a low brick retaining wall and marble obelisks, terminating piers at the sides of three converging paths, which are said to be the remains of a design for gardens prepared by Sangallo.

Before considering the buildings in detail it should be noted that they have been very badly used, and also that, according to an inscription on the north front of the loggia, they were restored by Pope Leo XII. There are some drawings in the Vatican Library, made in 1836-1837, to which reference will be made later, which show some minor differences from what remains at the present day.

The casino is at present used as a repository for the late Pope's (Leo XIII.) letters, and permission to measure the interior was therefore refused; it contains two or three fine ceilings, some paintings by Zuccaro Barroccio and Santi di Tito, some antique mosaics, and very interesting floor-tiles. There are also some very fine terra-cotta panels from the Borgia apartments placed here by Canova.

It will be seen that on plan the loggia of the casino balances the loggia on the opposite side of the court. It is a barrel-vaulted apartment, with apsidal ends, roofed with semi-domes, in which are two niches containing antique statues; the walls are covered with a kind of coarse mosaic of dyed marble chips, and above this is a painted frieze of cupids. It might here be mentioned that the frescoes, mosaics, and plaster-work were carried out by a band of artists under the direction of Marc Antonio Amulio, who was decorated for his services by the Pope in 1561. There are two fine marble basins in this loggia which are shown in the drawings above mentioned as having marble candelabrum shafts, richly encrusted with carved ornament above the basin, for water, but of the shafts there is now no trace. The ceiling is especially interesting (see views); above the frieze is a moulding of white marble which marks the springing of the barrel vault, above this are four small plaster panels, divided by hermæ and forming a division of the vault surface. Above this again are large fresco panels, separated by modelled candelabra, gilt, the centre one surrounded by a broken pediment, and above again are three large fresco panels, forming the centre of the vault. The semi-domes are slightly different in treatment and contain three fresco panels, and in the top of the semi-dome is a plaster

The Villa Pia : North Entrance.



The Villa Pia : Side of Loggia.

richment which suggests the fore-
hner of the Adams work, and is also
ry similar to plaster-work in the wall
ades of the Villa di Papa Guilio. The
hes separating the semi-domes from
vaults are painted in fresco and
hly panelled and moulded, and in the
tre have the Medici arms in relief.
e whole of the enrichments here are
ked out in gold, and give a general
ect of great richness to the whole
nposition. The pavement of the
gia is of coloured marble and contains
cosmati slabs set in the design.
the centre of the loggia, against the
ll, is an antique statue on a Corinthian
pital.

The exterior is well designed and
very reminiscent of the work at
Villa Medici (now the French
ademy) completed by Lippi about
enty years before. Above the small
der is a high stage divided into three
pilasters, with floral scroll enrichments,
the centre division of which are three
aller panels, two, round-headed, con-
ning figures, and a centre one, square,
h *armorini* supporting the Papal
ns. A long panel fills up the upper
t of this division and contains a Latin
cription. The division of the front is
mpleted by two narrower panels con-
ning two medallions and panels.
ove this is a string-course ornamented
h a fret, and above in the centre por-
n are three windows surmounted by
dallions and floral garlands. At the
es are two niches containing statues.
e frieze is separated by an astragal
m the lower portion, and is enriched
h a luxuriant floral scroll. The whole
surmounted by a cornice and tiled
f hipped back to the centre.

The steps in the court are flanked by
tti, of white marble, riding on sea-horses
ced on the cope of the dwarf wall
rounding the court. This court has
range of seats broken only at the
rticoes and arches, and on the wall are
ster vases containing plants, which
ve, however, been moved from their
ginal positions, as may be seen from
rks on the cope.

The pavement of the court is a geo-
trical pattern in grey and white
rble, and in the centre stands a foun-
n attributed to Gio Vasanzio, who was
led "il Fiamigo," a Flemish architect
o worked on the Villa Borghese in

The Villa Pia: Apse of Loggia.

1616. This fountain consists of a basin of basalt supported on trusses, and at the ends are placed *putti* and dolphins standing on shells in the water. The loggia is reached, like the casino, by steps from the court, and, like it, contains a barrel-vault and two semi-domes. The elevation is simpler in conception and consists of the Order, above which is a high attic with three divisions. The centre panel contains a representation of Apollo and the Muses, and in the middle is a pediment borne on twisted columns framing a seated relief figure of Tragedy and bearing the Papal arms in the centre. The side panels contain similar pedimented frames in which are figures of Prudence.

On the pilasters at the end are placed caryatides boldly modelled, and these are repeated round the corner. The large pediment contains a representation of Aurora surrounded by the signs of the Zodiac.

The side elevations are also worthy of study. The entablature of the Order is broken to admit of a window, and is stepped against a panelled plaster on the north angle. The caryatid figures also appear and a freely-handled plaster panel fills up the attic stage. The whole is crowned by a segmental pediment, placed over the whole front, without regard to the break of the cornice over the pilaster referred to above and without regard to the axis of the window.

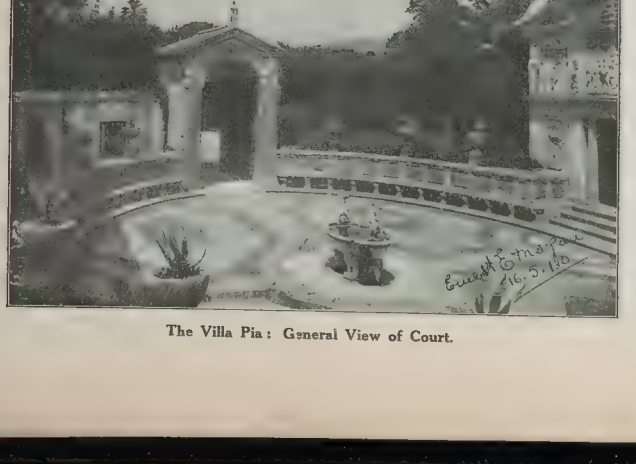
The interior is also interesting and quite different to the loggia of the casino. The surface of the barrel-vault contains, above the springing, an architectural division of a tiny Order of columns, some fluted spirally, some straight, and some encrusted with scroll foliage, bearing a complete entablature and pediments, and forming panels, alternately fresco, and moulded in relief, as small windows.

The Villa Pia: Barrel-Vault of Loggia.

Above are three large panels filled with frescoes, and the surface of the vault is decorated with enrichment in low relief. The semi-domes are similar with respect to the columns, but the panels are alternately oval and square, and there is no fresco decoration.

The walls of the apse are plastered and have a diaper of pieces of mosaic set in the white surface. The heads of the niches are elaborately but daintily enriched, and marble basins are placed in the ends of the apses.

The north elevation of the loggia is simpler, but, according to the drawings, has suffered from neglect and ill-treatment, as all trace of male carytides shown as existing in 1836 have disappeared. There is a large opening extending from floor to cornice, and the Order of the front appears as a minor feature supporting a cove, in which is an inscription to the effect that the Pope Pius IV. built this portico and ornamented it with columns of Numidian marble. The frieze contains an inscription recording the restoration of this front by Leo XII. In the pediment are the Medici arms, and they are repeated on the two centre dies of the white marble balustrade. The lower portion, or "lymphæm," ends in a fern-grown shelf over a pool, into which water is ever falling from two basins at the sides of the building, and is ornamented with three antique statues, the centre one of which, a beautiful Thetis, is raised on a rocky pedestal covered with ferns, and stands against a circular-headed panel. The statues at the sides are smaller, and are placed in square recesses lined with antique slabs.



The pool overflows in a very naïve manner into a gutter. The water-chamber is placed behind the lower portion of the loggia.

The arches at the entrance are also beautiful, both in design and detail. The two pilasters, with the fronts, encrusted with coarse mosaic, support an arch and pediment, and the whole is set to the curve of the court. The inner arches are filled with graceful shell enrichments, and the outer tie-rods are decorated with foliage. The interior consists of a barrel-vault richly panelled, above walls containing three niches on each side and decorated in mosaic in a manner suggestive of the antique Roman wall paintings. The friezes on the exterior also are beautiful pieces of design based on that of the Roman Temple of Faustina. The simple wood gates are also worthy of note.

The above is a description of a work which is little studied at the present, and which shows a Renaissance architect's idea of a small villa. Free but scholarly in its treatment, all the details exhibiting much thought and care, and the whole design showing a straightforward conception, this villa may fitly take its place in the series of beautiful small villas of the culminating period of the Roman Renaissance.

As Mr. Halsey Ricardo pointed out in his paper on the Villa Madama, read before the R.I.B.A. (January 20, 1911), the architects of the Renaissance wore their scholarship lightly, and surely no happier example of a happy saying could be found than the subject of this sketch. The forms are antique, much of the material is Roman, but as placed in position the result is entirely novel and entirely charming. The whole is typical of the period, and testifies to the skill alike of Ligorio and his assistants. No words, however, and no photographs can give any idea of the exquisite charm and sparkle of this work, situated as it is under the shadow of St. Peter's, nestling among cypress-trees on the hill, the water playing softly in the fountain and overflowing from the pool with a gentle melody which seems to be the embodiment of the spirit of the place. Time has, in the main, dealt kindly with it, and a few slight repairs to the fabric are all that is necessary to preserve this gem for many years to come to delight the eye and sense of those who have the privilege to enter the garden of the Vatican and to visit this Papal pleasure house.

[The photographs accompanying this article are from negatives by Mr. E. E. Morgan, A.R.I.B.A., to whom we are indebted for permission to use them.]

The Villa Pia: General View of Court.

NOTES.

Monuments in our Parks.

The idea of the averag Englishman that a par should be a little piece Nature preserved in all its sylvan beaut amidst the formality of its surrounding was again put forward in the debate i the House of Commons on the sit for the King Edward Memorial. Som members appeared to object on princip to statues being placed in a park, the ide seeming to be that no statue is ever s beautiful as the blades of grass it su plants. This opens a large question, an on the same reasoning no building woul ever be sufficient compensation for th light and air it displaces or for th beauty of sky which it hides from ou view. If the idea that the least of th creations of Nature is preferable to th greatest of the creations of art is to pre vail in such matters, there is, of course no more to be said; architects an sculptors may put up their shutters, an the King Edward Memorial take som non-material form. After all, it a depends, we suppose, on how the thin is done. Candour compels the admis sion that, as a matter of fact, many o the statues and other monuments w have hitherto put in our parks are n real compensation for the natural beaut they displace. But the thing can b done, as anyone acquainted with th Stadt Park at Vienna, or the publi gardens of Paris, and of many other conti nental cities would immediately realise Apart from the artistic merits of an particular statue, the placing of it is a art in itself—an art which in the past ha been too much neglected in this country and has not received too much considera tion in the King Edward Memorial So long as our public authorities o selected Committees continue to allow any other consideration but that o artistic fitness to influence the positio of our public monuments they cannot reasonably complain of the results.

Architecture and Local Patriotism.

We cannot but sympa thise with the outburst o patriotic feeling which marked the opening meet ing of the Glamorgan County Council in their new County Hall at Cardiff even though it was caused by dissatis faction with certain aspects of the building. The entire absence of anything emblematic of Welsh ideals and national sentiments was adversely commented upon, though the meeting was not altogether agreed as to whether certain features behind the Chairman's seat were or were not goats' heads, or "billy-goats' jimmies," whatever they may be. The names of Nelson and Wellington inscribed on the walls were all very well, but where were Owen Glyndwr and Owen Gwynedd? Byron was given another niche in the temple of fame, but why not Dafydd ap Gwilym and other native worthies whose names are even more difficult for the mere Saxon to pronounce? Why not, indeed? In these days of cosmopolitanism in art it is just these fine distinctions which are so valuable as enabling an architect to express more exactly the purpose of a building and to give it distinctive character and local interest. While the

ctions of County Councils remain the
ie in every part of the United King-
n the County Halls which express
se functions must no doubt tend to
somewhat alike in their lay-out and
eral appearance. The finer shades
expression seem to depend largely
a sympathetic understanding and
sentation of local character and
lition in those features which are
so entirely dominated by matters of
ctical necessity common to all alike.
he Saxon was only as susceptible as
Celt to fine shades of artistic expres-
n architects would probably devote
re attention to them, greatly to the
antage of the art.

ie Question of Acoustics.

As, moreover, the acoustic properties of this hall do not appear to be quite sfactory, the *Western Mail* suggests t the alterations necessary to repair defect will provide an opportunity n the form of hangings or drapery—for introduction of such national emblems may be desired. Some such device often successful in overcoming these ustic difficulties, which certainly con-ute one of the most uncertain and zzling of the problems with which the dern architect has to deal. For some son or other, it seems most difficult guarantee that a hall of any consider-e size shall be perfect for speaking l hearing. Although its height and proportions generally, no doubt, rcise a considerable influence, it is sible that the hardness of modern terials and finishings have a good deal do with it. Hard bricks in cement shed in Keen's cement and concrete ings probably accentuate the difficulty. hough we are by no means sure that would be possible to lay down any cise and definite rules, or to evolve general principle of universal appli-ion that would ensure good acoustic perties in any and every building, the ject is one to which more systematic ention might well be directed. Per-ps the Science Committee of the titute might make a pronouncement this question, or suggest it as a fitting ject for a paper and discussion at ordinary meeting.

Competition Ethics Again.

We regret to see it reported that the Melford Rural District Council. er having engaged an independent hitect to decide finally between four cted designs in a competition, have own over his award for reasons which pear from the report to be entirely dequate. One member, we are pleased see, could not understand the Com-ttee calling in expert advice and then oring it. Neither can we. Nothing uld be more illogical or, as a general e, more detrimental to their own erests. A letter to the local Press tes that the competitor whose design s finally adopted by the Council had cularised the members of the mmittee before any award was given, nting out the merits of his own ign. Any such conduct as is here ged is rightly considered to disqualify competitor in a properly-conducted petition, and it cannot be too strongly demned.

The Strike.

It is to be hoped that even before these lines appear in print the miners' leaders will have adopted the only course now open to them, and will have advocated a general resumption of work. It is not for us to discuss in these columns the wisdom of the policy either of the men or of the Government in connexion with the strike, but in view of the general dislocation of trade we may point out that nothing is to be gained now by useless recrimination or by a prolongation of the dispute. The men may not realise the vast concession that has been made in the recognition of the principle of the minimum wage, but the leaders must appreciate it, and the nation are alive to it. The prolongation of inactivity can only now serve to eliminate any sympathy with the miners' cause and arouse the country to call for immediate legislation for the protection of its industries.

PICTURE EXHIBITION.

The Royal Society of British Artists' Spring Exhibition at the Suffolk-street galleries is quite the most interesting show of pictures which this Society has provided in recent years. Every wall repays examination. There are many pictures of high merit, and the general level is much above the average. Mr. Alfred Hartley's "Sky and Upland" is one of the first pictures to attract attention on entering the central gallery for its abstract poetic and decorative quality. Mr. Hartley's work is much closer to nature than many more realistic efforts: the clouds and upland and sheep resolve themselves under his brush into a generalised composition in which photographic verisimilitude is the last thing sought for. The "After the Ball" of Mr. Joseph Simpson recalls in the reclining attitude of the female figure a well-known work of Manet. Mr. Simpson uses his colours with a somewhat Post-Impressionistic boldness, but he attempts no tricks in either composition or drawing in this interesting picture. Our eye is next caught by a crude but effective and animated scheme in green, blue, and white, worked out in a mosaic combination of colours after the manner of some of the early impressionists—"The Border Castle." by Mr. Foottet. This method of painting has appealed to more than one artist at the exhibition, but none has employed it with greater apparent spontaneity than Miss Dorothea Sharp in her two pictures, "The Wind on the Hill" and "The Apple Tree." Mr. Elphinstone and Mr. D. Murray Smith are stylists. Each composes, arranges, selects; each goes to Nature with the object of discovering her secrets rather than with the object of serving up hot, as it were, a counterfeit presentment. Of the two, Mr. Murray Smith is the more formalistic; Mr. Elphinstone, we should imagine, the more inspired. "The Two Mills" by the latter painter, a winding canal, threaded by shipping, with mills in the distance, is one of the most notable pictures by this artist which we have seen. In quite another manner is "The Bathing Place" of Mr. Harry W. Adams, which is interesting and effective in its spacious way, but not quite convincing. "The Towing Path Bridge" by Mr. John Muirhead, represents yet another phase of the painter's outlook, in which the play and gradations of atmosphere on the extended vistas of a rolling countryside provide the theme. The work of the President, Sir Alfred East, is too well known to require commentary in the brief space at our command; and for the latter reason we must also omit mention of many works that certainly deserve it.

ART MUSEUMS AND PICTURE GALLERIES.

The usual fortnightly meeting of the Royal Institute of British Architects was held on Monday, at No. 9, Conduit-street, W., Mr. E. Newton, A.R.A., in the chair.

Mr. H. T. Hare, Hon. Secretary, announced the decease of Mr. F. W. Albury, elected an Associate in 1866 and Fellow in 1875, and placed upon the retired list of Fellows in 1900.

Mr. E. T. Hall then read a paper, of which the following is an abstract, on "Art Museums and Picture Galleries":—

"Let us consider the main lines and general principles on which an art museum should be designed.

It must be borne in mind that there are often priceless works of art in such a building, and as, alas, there are thieves in the world, it is not desirable to have more than one door (or group of adjacent doors) both for the ingress and egress of people in normal circumstances, so that all may be under observation by the same attendants! Fire escape exits in a large building may be necessary, but these should be safeguarded. The common ingress and egress facilitates the placing of cloakrooms. A spacious vestibule or hall will, of course, be necessary, and should be consonant with the dignity of the place.

Assuming a large building on more than one floor, the main staircase should be conveniently near the entrance, so that visitors to departments upstairs may at once be separated from those to the lower departments, thus reducing or disseminating the volume of people.

The administration offices should be placed in a position convenient for those who have merely business relations with the museum.

I do not propose to deal in detail with such necessaries as refreshment-rooms, etc. They may be placed where convenient for general access, but it must be remembered that the supplies and staff should have access without having to pass through the galleries.

The general disposition of departments now demands attention. Top-lighted galleries may be placed in internal courts with rooms around them or they may be on the top floor. The latter position is, I think, preferable for many reasons, one of which is that if the central gallery has a roof at the height of the surrounding building this will be quite unsuitable for anything but sculpture or architecture, and if the roof be kept down the shadow from adjacent buildings will be objectionable.

There is a widespread view among directors that there should be internal open courtyards to museums, and Doctor Gustav E. Pazaurek, the director of the museum at Reichenberg, in 1903, said:—"The internal courtyards of a museum should be laid out as gardens in which should be sculpture meant for outdoors." You will, of course, call to mind many sculpture gardens in Rome, Florence, and other parts of Italy. It is objected by some that our climate does not suit open courtyards for sculpture, etc., although last summer we had climatic conditions as favourable as any further south, but if we accept the inferential objection, this could be met by a plain glass roof with open sides, converting the courtyard into a covered garden. I think this courtyard feature is one to be encouraged and developed, and, although we cannot have such large spaces as the Italian courts and gardens or even the Grand Cour du Louvre at Paris, we could frequently have them of areas larger than the Octagon Court of the Vatican, which is but 20 metres across.

This suggestion of sculpture in gardens brings us to the consideration of sculpture galleries themselves. There is considerable difference of opinion as to the best means of displaying

D

sculpture. Some authorities favour large courts or galleries with plain glass roofs all over the area—in fact, the nearest approach to the open air; others say sculpture is best displayed by light coming from windows placed high up near the ceiling, the sculpture being placed near the opposite wall so that light may come diagonally to it.

Coming to the general disposition of other galleries in a museum, what is to be the principle on which they are to be laid out? Are galleries for all the different exhibits on a floor to be in one range—that is, to open into one another so that a visitor shall pass through all and make a circular tour back to his starting-place? Are galleries to be in groups so that each group shall take one branch of art and illustrate it through all time? Should art work of all kinds of each period or era be illustrated together in the same room or gallery?

For the convenience of administration and supervision only, the one continuous range is better. Large numbers of people are passing in only one direction and do not interfere with those following them. On the other hand, if a visitor wants to contemplate one period of art—be it painting or any other manifestation—he has to make the other rooms mere passage-rooms, and this, further, is disturbing to the art students in those other rooms. Professor Lichtwark condemns galleries used as passage-ways, and lays down as fundamental conditions of planning "free movement and quiet." He thinks the ideal is "broad corridors unobstructed and exhibition galleries disconnected one from another and accessible only from the corridor."

In small museums or galleries the question we are considering settles itself. The floor area is limited and the galleries on any one floor become a manageable unit which, if well arranged, meets with general acceptance, as in the examples of Aberdeen and Linz. Liverpool is on a different plan, but is still of manageable dimensions. It would appear to be possible to apply this small unit principle to a museum of any dimensions, however large. The Kaiser Frederich Museum at Berlin, erected in 1905, is a combination of the two systems. You may go all round, but it is possible to short-circuit home. The City Museum at Amsterdam and the National Gallery in London are similarly arranged.

The general principles of the scheme having been considered, we come to the ordinary galleries. As far as I can gather, the general feeling in respect of all except picture galleries is that side-lighted rooms are best.

It will be readily seen that show-cases having shelves will be better lighted from the side than from the top. For efficient lighting in our northern clime, cases should not be placed more than, say, 20 ft. to 25 ft. from a window. Windows in our climate should be kept as close to the ceiling as possible so as to get the highest possible angle of light, and in order to get the valuable reflected or diffused light from the ceiling surface. Show-cases should be placed with the long axis perpendicular to the window. If they are placed parallel a visitor casts a shadow on to the exhibit at which he is looking if his back is to the window, and if he is facing it the glare of the window will be in his face, obscuring the exhibit in the case. Nothing is gained by making these galleries more than, say, 20 ft. high.

For the proper display of tapestry and carpets upon the wall, side light is imperative. They are lost and wasted in large galleries lighted by glass all over. The top light casts a shadow from each stitch on to its neighbour, thus darkening the whole colour effect, and when the tapestries are covered with glass the rafters of the roof are reflected in the glass.

In the case of pictures with heavy and dark varnish and those darkened by time, light from above shows only a mass of black, while in a good side light they still present great richness of colour, and details become visible which had before completely escaped the eye. The superiority of side light is that it permits of placing oneself in a position to see the roughnesses on their lit-up side.

It may be noted from experiments that a good height for the window-sill of side-lighted rooms is 7 ft. 6 in. above the floor, and in Brussels, where the sills were lower, the authorities have fitted shutters to a height of about 7 ft. from the floor.

One difficulty with window-lighted rooms is the glare on the opposite wall. In the Bardini Gallery the back wall is not parallel to the window, but at an angle of one in eight, and there the difficulty disappears. In many side-lighted rooms, as, for example, the Hof Museum at Vienna, the City Museum at Amsterdam, the proposed Museum at Haarlem, and other museums, the side walls are not at right angles to the window, but at an angle of about 75 deg. converging inwards, and this materially adds to the illumination of the pictures. In some galleries pictures on the side walls which are perpendicular to the window are each set out at a similar angle, but that is not so satisfactory, as each casts its neighbour into shade. It should be noted that no picture can be hung on a side wall close up to the external wall in which is the window, but this space is always utilised for the doorway.

The very general commendation of side lighted rooms for pictures, and their adoption in most of the large Continental galleries—as well as their existence in the many palaces all over Europe, which, after all, form the most renowned places of exhibition—would lead us to conclude that such picture-rooms should be provided in every large museum. Mr. A. W. Weissman, architect, of Amsterdam, points out that these should not be on the ground floor because of the reflection from the surrounding ground. However, the top light in some form is so general, and the convenience of being able to get a great amount of wall space for hanging on a limited site is so great, that this system will always commend itself for picture galleries.

I find that the general consensus of opinion is that great areas of light all across the ceiling, even where these are kept well away from the surrounding walls by wide coves, are to be avoided. They unduly illuminate the floor. The centre of the ceiling should be opaque—*i.e.*, there should be a plaster ceiling to obstruct direct rays passing to the floor, and only the side portions should transmit the light. Lantern lights with vertical glazed sides, as in Sir John Soane's Galleries at Dulwich, have been tried, but these are not satisfactory, as the area of the light is not adequate to illuminate the opposite wall.

A great improvement is seen where the flat ceiling of the lantern is reduced in width and the glass sides sloped inwards from the bottom. This arrangement exists in some of the rooms of the old part of the National Gallery in London, but the slope was too steep and the area of light had to be supplemented. It is proposed to adopt the principle in the new Welsh National Museum. In the new rooms at the National Gallery the lantern form has not been adopted, the skylights being of the ordinary saddle-back type, and there has been in the newspapers a great deal of adverse criticism of the result.

Another form giving excellent results in an oblong gallery is a semicircular or segmental roof with sloping side lights divided by a flat plaster ceiling, or, in a square gallery, a centre skylight similarly divided by a flat ceiling. An outer glass roof and inner ceiling light should be avoided; the double glazing greatly diminishes the light.

In this connexion it is opportune to speak of the height of top-lighted galleries. This height may be well determined by drawing a 45 deg. angle upwards from the base of the picture (say, 3 ft. from the floor), and where it cuts a vertical line parallel to and distant from the opposite wall one-sixth of the width of the gallery, the point of intersection should be the base of the skylight. Thus, in a gallery 24 ft. wide the base of the roof light should be 23 ft. above the floor and 4 ft. within the face of the wall.

Top-lighted picture galleries in museums should not be more than 30 ft. wide. The very few extra large pictures demanding greater distance for observation can be placed at the ends of galleries. Any greater width makes the height too much.

Rolling blinds are necessary for skylights to adjust the varying intensity of sunlight, and these should be inside. In the new rooms of the National Gallery the blinds are external, and whenever there is a change of intensity in light men have to go on to the roof to alter the blinds. This is very inconvenient, and external blinds get very dirty. The floor of all galleries should be dark to absorb and not reflect light, and the same remark applies to the dado or base of the wall.

The German directors and Professor Bather of late years have recommended that works of all kinds of art of a period should be located together in a room architecturally reproduced in the same period, so that all may be seen in their natural environment. Dr. Brinckmann, the Director of the Hamburg Museum of Art, says:—"The grouping of various art objects together shows how all grew in common out of the soil of a certain temper of mind and a certain hereditary taste," and he arranged a Paris room in this way so as "to display the individual objects in a manner most favourable to their mutual reaction in form and colour." Of this room, Dr. Graul, the Director of the Grassi Museum of Applied Art at Leipsic, writes:—"Except where the purely scientific interest compels a store-room arrangement, soon no museum directed by taste and intelligence will permit any other method of exhibition."

An important feature of a museum is the reserve galleries. They are not mere warehouses or storerooms. Some may be so used, and these should be near the goods entrance, but the main purpose, according to modern ideas, is that they shall be accessory to the exhibition galleries and that from time to time exhibits proper in the galleries shall be changed so as to keep up public interest.

Another matter of interest is that there should be students' research and copying rooms off each department, where students may be quiet. Copying in main galleries is deprecated by some directors as not good for students or for the public.

I have not yet mentioned the children's room as part of a museum equipment. It is, however, a modern adjunct, and it should be near the entrance.

Growing interest by residents in a city in the former history of their environment is a most healthy sign, and to encourage this sentiment a department should be set aside to illustrate by sketches, drawings, and models—in some cases actual size—the archæology of the district, the demolished streets and old-world buildings, the former rural scenery, etc., of cities which may now be covered by a mass of modern buildings.

Last of all the public rooms is a lecture theatre, and this should be so arranged that, while it is acessible from the museum, it may be separately entered from the outside so that it may be used when the museum is closed. It requires its separate cloakrooms, lavatories, exits, etc. Its form depends on circumstances. In some cases its use may be restricted to lectures, in which case a semicircular form is convenient, with tiers of seats. In other cases it may be adapted for other uses as well, as, for example, for photographic or microscopic exhibitions, in which case it is better to make it rectangular with a level floor."

[The following buildings, among others of a similar nature, have been illustrated in the *Builder*:—

Sheffield, Mappin Art Gallery (Messrs. Flockton & Gibbs)—Plan and elevation, February 4, 1888; Perspective, October 9, 1897; Extension, May 14, 1904.

Tate Gallery (Mr. S. R. J. Smith)—Elevation and plan, January 2, 1897.

Bury, Art Gallery and Library (Messrs. Woodhouse & Willoughby)—Elevations and plans, October 12, 1901.

Forest Hill, Horniman Museum (Mr. C. Harrison Townsend)—Elevation and plans, February 8, 1902.

South Kensington, Victoria and Albert Museum (Sir Aston Webb, R.A.)—Elevations and plans, May 2, 1903.

Bristol, Art Gallery (Messrs. Wills & Houston & Houston)—Elevation and plans, April 15, 1905.

Berlin, Kaiser Friedrich Museum (Herr von Ihne)—Elevation, January 5, 1907.

Birmingham, Art Gallery, etc. (Messrs. Ashley & Winton Newman)—Elevation and plans, January 19, 1907.

Cardiff, National Museum of Wales (Messrs. Smith & Brewer)—Elevation and plans, April 2, 1910.

Manchester, Library and Art Gallery, Proposed (Messrs. Crouch, Butler, & Savage)—Elevation and plans, December 15, 1911.]

Dr. Evans Hoyle

(Director of the National Museum of Wales), in proposing a vote of thanks to the author, said he thought it was essential that museums should be separated into sections for the general public and for the student and specialist. With regard to the sections for the student, they could not have too much material for comparison: but, on the other hand, the specimens for the general public must be limited in quantity, for each one must be the best of its kind and must be selected with a definite object in view and with a definite idea of what it was there for. This applied equally

artistic productions as well as to objects which were for the instruction of scientific facts and principles. Full justice should be done to the works of art exhibited, and each should be hung in such a way as to show it to the best advantage. Pictures ought not to be jammed up together as if they were trying to get so many on a wall, for that was absolutely fatal to any proper realisation of a picture as a work of art at all. There was no one background which was better than another, but each must be selected to suit the objects which were to be placed in contiguity to it. Dr. Hoyle referred to the Bavarian Museum at Munich, which he said was specially designed for works of art already collected. He thought it was ill they had that museum, but it would be an absolutely fatal principle to apply generally, because such a museum was obviously a finished museum. In other museums they had to go on building, and hence they must have rooms which could be adapted for all objects. With regard to lighting, Mr. Smith, Sir Goscombe John, and himself visited a great many museums in Europe, and the conclusion they arrived at was that for most modern pictures top lighting was the most satisfactory so long as it was not quite vertical.

Sir Goscombe John, R.A.,

seconded the motion, and said that the two things which it seemed almost impossible to bring into line in these matters were the interests of the dilettante person and the interests of the students. Many museums, like that of South Kensington, were huge depositories of beautiful objects; glorified *bric-à-brac* shops in which one put oneself. If a museum was to be a place to hoard beautiful things it must be arranged on very different lines to a museum for the purposes of the student. As to placing objects in their proper surroundings, they could at once disagree as to what the proper surroundings were. The church in the Kaiser Friederich Museum at Berlin was very interesting, but one certainly did not see the things to advantage, whilst they knew it was almost impossible to see many of the beautiful objects in the churches in Italy. One had to take a lighted taper and crawl on one's hands and knees to see the panels of Donatello at St. Antonio at Padua. He thought the most satisfactory lighting for sculpture was when it approximated to an open-air light, and wherever the light came from it should not bother the spectator in the slightest way. He recollected having some years ago to see the Hermes at Olympia, and found a window placed right at the back, which was absolutely the worst position in which to place sculpture.

Mr. Frank Dicksee, R.A.,

did not think there could be any question of the value of side lighting and top lighting for a picture gallery. Provided that the top lighting was scientifically right, it was the best way. As to backgrounds, it was difficult to say which was the best; but if they had to have one colour, he felt that perhaps red was the best. His own feeling was that it was an absolute mistake to have a neutral colour. If there was colour on the wall it started the eye on an exploring expedition in the matter of colour, and probably produced a better result than if they had a dull grey, colourless wall which did not stimulate the optic nerve in any way at all. He was inclined to think that architects when dealing with pictures concerned themselves too much with their architecture and not enough with the object which they were, as it were, called on to serve. He thought that even in that building they had put their pictures too high up on the walls. From the point of view of decoration they were too high, and from the point of view of examination they were undoubtedly too high.

Mr. W. Woodward

thought that the architect in designing a building for a museum tried to make a magnificent architectural building without the slightest regard for the uses for which it was to be put. They also had not enough idea of simplicity of planning. He was sorry Mr. Hall did not refer to the Tate Gallery, as he considered it one of the best lighted in Europe. It was a curious thing that they had curators and directors reading papers on museum planning, and yet they went on repeating the blunders of the past. A building was put up, and then the curators said it was all wrong. He suggested that when the next museum or picture gallery was built the directors would confer with the architect so as to prevent costly blunders.

Mr. H. H. Statham

considered the best way of lighting was a lantern in the centre, with the lights vertical and the centre part opaque. As to the lighting of sculpture, he thought the sculpture at the Palais des Beaux-Arts at Paris was exhibited under almost ideal circumstances. It was almost the same as daylight, but there was shelter for the weather. He was looking forward to the time when the Royal Academy would have the will and the power to roof in the courtyard of Burlington House and put all the sculpture there instead of crowding it into the rooms as now.

Mr. A. T. Bolton

said they heard a good deal about museums being an absolute weariness, but there was another side in regard to the design of museums and picture galleries. Anyone going to the Louvre on Sunday must be impressed with the great stream of people coming in, and they must derive a great deal of good from the association of a fine interior with the pictures. He thought these buildings should be planned in a large way with large rooms, and with a dignified architectural effect, for that was as important as the point of view of enabling the pictures to be seen in minute detail. He did not agree with Mr. Woodward as to the Tate Gallery, because he considered it one of the worst lighted he had ever seen. There was no gallery more troubled with reflections than the Tate Gallery. He had just seen the new Birmingham Gallery, and had been greatly impressed. There they had done exactly the reverse to what had been done in the new buildings of the National Gallery, and had gone back to the old flat ceiling, such as Barry designed for the National Gallery in 1870. He thought that if the pictures were found to be properly lighted at Birmingham, as he believed they would be, they would have to reconsider the matter.

Mr. Matt Garbutt

pointed out the difficulty of seeing some of the old pictures in museums owing to their being glazed, which, of course, was necessary for the presentation. He suggested whether it could be possible to put temporary black screens in front of these pictures to get over the reflection.

The Chairman

said the whole subject was a difficult one, but difficulties were the architect's opportunities. As architects they could only have one view, which was that fine art must be finely housed. Practical problems, however, must be faced, because, in so far as a building of that sort failed in its practical purpose, it failed also as a real piece of architecture.

Mr. Hall

briefly replied, and said Sir Charles Holroyd had written pointing out that one difficulty was the policing of small rooms. He did not think it would be possible to have screens as suggested by Mr. Matt Garbutt.

It was announced that an extra general meeting would be held on April 15, when the discussion on "The Newer Responsibilities of Architects" would be resumed and a further paper read by Mr. A. Saxon Snell.

THE ARCHITECTURAL ASSOCIATION:

SIXTH SPRING VISIT.

For the third time since its commencement members of the Architectural Association visited, on Saturday, March 30, the new Wesleyan Church House, Westminster, now in a very interesting stage. Members assembled in the Great Hall, of which the fine proportions can now be appreciated, though the inner dome above its pendentives is at present obscured by staging, albeit the latter afforded a chance of examining at close quarters the extremely bold coffering and modelled plaster-work. The planning of the tiers and galleries with the position of their entrances and exits in re-entrant angles of the square proves admirably adapted to secure at once a good view of the platform and great facility of access from all parts. It is risky to predict as to acoustical properties, but it appears that the re-entrant angles should also serve a purpose in preventing echoes. From consideration of mere window area it might seem that the Hall would be under-lighted, but in practice it is most satisfactory, the superior value of high lighting being well seen.

An inspection was next made of the dome construction, the large space between the inner reinforced concrete dome and the outer dome of timber covered with lead upon a skeleton steel frame being accessible, and containing apparatus in connexion with heating, ventilation, and lighting, and a spiral iron stair to the central cupola. The lead covering was also examined with interest, and portions of the cast enrichment were seen in process of fixing. Descending to the ground floor, which is placed 7 ft. above the road level to secure better lighting for the large tea-rooms and other rooms in the basement, the small hall, seating about 600, and the library, usable jointly or separately at will, were visited, and from thence the main entrance hall was reached. The planning of the grand approach to the Great Hall provides a most telling series of architectural contrasts. Entering at ground level into a low elliptical vestibule, a broad central flight of steps ascends to the ground floor. Here from the spacious and dignified entrance hall the library is approached on the left and the small hall on the right. The grand staircase, doubling back, continues as two flights above the vestibule, reuniting as a single central flight, and again diverging as two sweeping flights for the final rise to the Great Hall level, where it delivers most effectively into a long low foyer or ante hall, whose proportions immensely set off both the staircase and the Great Hall. It is quite the most ambitious staircase in London, and displays real architectural motive in the relation between each of the sequence of apartments from the entrance to the assembly hall. On either side of the main stair case are enclosed subsidiary stairs in the towers, approached both from the vestibule and the street, and serving also the basement and the assembly hall galleries, communicating with the latter by circular crush-rooms or ante halls in the angles of the building.

The interior detail is fresh and vital, though described by the architects, Messrs. Lanchester & Rickards, as "somewhat austere." The visit was full of interest, and was much enjoyed by a very large attendance.

COMPETITION FOR ST. PETER'S, ACTON GREEN.

A competition, limited to seven architects, for the Church of St. Peter, Acton Green, has just been decided by the assessor, Mr. F. R. Hiorns, A.R.I.B.A.

The site, at the corner of Southfield-road and St. Alban's-avenue, is rectangular and level. The back portion of it is occupied by a mission hall. The church has to be placed between this hall and Southfield-road, leaving access to the hall from St. Alban's-avenue. The immediate surroundings consist of small two-storied houses of the usual deplorable type.

The conditions require a total accommodation for 650 persons in the church, including fifty in a chapel on the north side of the church and thirty seats in the chancel for clergy and choir; also a clergy and a choir vestry, with lavatories, and an organ-chamber on the south side of the chancel.

The total expenditure, including architect's and surveyor's fees, was limited to 7,000*l.*; this amount to include heating and ventilation, fence to St. Alban's-avenue, pulpit, and a certain number of permanent fixtures.

The site, being restricted and partially occupied, allowed little opportunity for original treatment in the general lay-out; orientation necessitated the long axis of the plan being parallel with Southfield-road, with the west end and main entrance facing the side street. The position of the chapel and of the organ-chamber being laid down by the conditions, and the cost being strictly limited, the designs are necessarily all on the same general lines, and are all treated elevationally in a simple rendering in brick of the later Gothic.

Although the plans are all more or less alike, they can be roughly divided into two classes—those with seats in the aisles and those without.

The winning design, by Mr. W. A. Pite, is one of those which shows seats in the aisles. It has a comparatively narrow nave with central gangway, from which the seats are continued into the wide aisles with side passageways against the walls. The general arrangements are on the lines suggested by the conditions, and appear to be well thought out. A special feature, which should give

a pleasing result, is created at the west end, where the font and the two entrance doors are treated as a baptistry or narthex. The interior effect should, we think, be good, though we are not quite sure about the height of the aisles, kept low presumably to allow a good height to the clearstory. The chapel ceiling also appears perhaps a little inadequate, but this, if a defect, is a minor one which could easily be reconsidered in execution. The elevations are good and extremely simple without being too plain. Breadth of treatment has apparently been aimed at, and this effect is helped by a long unbroken roof. The cube is stated to be 266,706 ft. at 6d.=6,667*l*. The whole design seems simple, pleasing, and practical, and should work out well and prove satisfactory.

No. 1, by Sir Arthur Blomfield & Sons, is a very reasonable plan. The building allows more space between the east end and the adjoining houses, giving a view of the mission hall. The arrangement of the west end as a sort of narthex seems good; the elevations are simple, but perhaps a little old-fashioned in sentiment. Cowborough stocks with red quoins, and a few stone off-sets, and a red-tiled roof are suggested. The cube amounts to 237,921 cubic ft., and the cost is 7,000*l*.

No. 2, by Messrs. M. B. & M. R. S. Adams, consists of three alternative designs. Considering the restricted scope of the scheme, this hardly seems worth while. The various alternatives do not appear to differ enough in idea to justify the amount of labour. Probably the authors would have done more justice to themselves if they had concentrated on a single one. They are all pleasing in design, and aim at breadth of effect. The cube of the first is 226,671 cubic ft., and the cost 6,468*l*.

No. 3, by Mr. J. S. Alder, is not quite so simple as the others in its general treatment. The drawings seem to give the suggestion of a pleasant but more expensive class of building. Seats are shown in wide, lofty aisles, with no clearstory over. The bell turret at the west end appears to create an awkward and useless feature on the plan. The organ-chamber is made a special feature on the south side of the chancel, as desired. Beyond the organ-chamber and outside the main structure are the vestries, treated more as outbuildings.

No. 4, by Messrs. Hall-Jones & Cummings, show seats in one aisle only. The narrow south aisle is a passageway, while the wider north aisle is continued eastward to form the chapel. Narrow choir aisles are inserted on either side of the chancel, with entrances at the east end serving chapel and vestries. This design also shows no clearstory.

No. 5, by Messrs. Comyn & Durst, gives an alternative, which is perhaps the more interesting of the two. It is something of a departure from precedent, inspired by the domed churches of the South of France. The whole of the seats are in the nave, and the aisles are reduced to passageways. The wide space thus obtained forms two squares on plan, and is vaulted over in reinforced concrete. The elevations, however, follow more nearly the Gothic traditions. The cube is 300,000 ft., and the cost, without small tower, is estimated at 6,875*l*. It is a good attempt to deal with modern conditions and methods of construction.

No. 7, by Mr. Louis Blanc, shows a nave 35 ft. wide in the clear, with narrow aisles forming an ambulatory right round the church. But as his seating accommodation in the nave is not quite sufficient, he creates a small south transept, containing seventy seats, from which it would be impossible to see the altar; the pulpit and lectern, however, are well in view. The provision of this transept hardly seems to be a strong point in the design. It would, we think, have been better if the whole of the seats could have been provided in the nave. What does, however, appear to be a strong point is the excellent treatment of the chapel and north door with wide entrance vestibule.

In its general bulk and outline this design differs from most in being broader and in taking up more depth of site. While all the rest keep to the building line of the adjoining houses, this one projects the whole length of the chapel and entrance porch up to the limit of the site. Whatever practical advantages may be gained we are not sure that even if permitted by the local authorities this departure from the general building line of the street is to be commended.

The cubic contents are given as 198,546 ft., and the estimated cost is 6,950*l*.

THE CARPENTERS' HALL LECTURES:

DEVELOPMENT OF PLANNING.

THE tenth and concluding Carpenters' Hall lecture on the Arts Connected with Building was delivered on Wednesday last week by Mr. Gerald C. Horsley, President of the Architectural Association, on "Influences in the Development of Planning," Mr. John Hooke, Middle Warden, presiding.

The lecturer showed a large number of lantern slides, and in the course of his remarks he said:—

"The arrangements of the plan sets the key and decides the scale of the completed design; it is the anatomy of a building, and if the anatomy is carelessly designed and ill-proportioned, the result will be inartistic, a failure from the point of view of utility, and an addition of no interest or value to our land. Thorough training in planning is essential to an architectural student, who will find that his talents have as much scope for expression and development when brought to bear upon the design of a plan as upon that of the elevation or decoration of a building. A good plan must be more than merely convenient; to be worthy of being called architectural, it must show originality in its conception as well as beauty. Genius must dictate the arrangement and disposition of its parts. The two principal influences which affect the development of planning are, first, the personal influence of the designer or architect—that is the influence of the artist; and, second, the racial influence—that is of the manners and customs and modes of life adopted by the different races of the world. I propose to limit my remarks to a consideration of the planning of domestic buildings in the past, and at the present time in this country, with some comparison between our methods and those which obtain abroad. We English folk are descendants of a Northern race, and it can be proved that the planning of our domestic buildings has, during the passing of the centuries, possessed characteristics which are directly traceable to the customs of this Northern people. On the other hand, in the case of the inhabitants of France and Italy, it is possible to show that the planning of their domestic buildings has been largely dominated by the influence of their chief ancestors—the members of the great Latin races."

Having referred to the Pictish "Broch," the lecturer said:—"The prototype of the English house is the home of our Saxon ancestors, the ancient hall or halle, containing the open hearth for the health-giving fire. It is remarkable that the rulers of our island before the coming of the Saxons, namely, the Romans, although they built largely themselves, should have exerted so little influence on our traditions of building. The destructive Danes laid waste the Roman buildings, and comparatively few were left to instruct our more immediate ancestors, the Saxons.

On the Continent of Europe, on the other hand, despite the successful invasions of the Northmen, the old Roman domination in art persisted; and when the Normans attacked England in the XIth century and subdued its Saxon inhabitants they initiated the building of the Norman keep, an art doubtless acquired by them from the ancient Roman tradition. But the designs of the Normans did not oust the hall from its position of supremacy. On the contrary, the halls built by the Normans in connexion with their castles were very notable; the one at Oakham is a well-known example. The Sagas tell us that the larger Saxon halls were built of timber and were planned like a church, with nave, columns, and aisles. The hall at Oakham, and other examples of Norman work, show this early type translated into stone. The similarity of the hall to the church is an instance of that kinship which exists in all living periods of art between forms of building. In spite of the beauty of their halls, the art of planning in the time of the Normans was crude.

Alexander Necham, or Nequam, a schoolmaster of St. Albans, in the end of the XIIth century, and afterwards Abbot of Cirencester, describes in his treatise, "De Nominibus Utensilium," the various parts of a house in his day. He speaks of the hall, the private bedchamber, the kitchen, the larder, the sewery, and the cellar. Of such rooms, of course, the hall was the chief apartment, and Necham's description represents the type of house which flourished with but slight changes and developments until the opening years of the XVI century.

The Saxon house plan was a single hall built of wood, with a separate apartment for the women. In the latter centuries of the Saxon domination in England their buildings were often of stone in the Roman or Romanesque manner—"more Romano"—and frequently these houses were built by hired artificers from the Continent. No kitchens were needed in these early days, for the same fire which warmed the inhabitants of the house sufficed to cook the food.

These buildings were of one story. They were often connected with covered ways, and the old Saxon manuscripts frequently show delightful pictures of them surrounded by a wall with their roofs just appearing above it."

Having referred to Stokesay Castle and Haddon Hall, the lecturer said—

"It is in the XVth century that we observe for the first time clearly the combination of the two influences on planning to which I referred at the outset. Hitherto the influence of the race has been more dominant than the personal influence of the artist. In the XVth century we see a greater expression of the artistic power of the designer. Warkworth Castle, Northumberland, is an example of an attempt at a symmetrical plan, though the result is not altogether successful; it is notable because the principal rooms are on the first floor, a practice more French than English; one also adopted by the builders of Scotch houses, and a method of design borrowed, no doubt, from abroad.

It is interesting to see how the earlier influence remains in the plan of South Wingfield in Derbyshire, though of precisely the same date as Warkworth, namely, 1435. Another house of much interest built exactly at this date is the famous Jacques Cœur's house, at Bourges, in France. A glance at the plan will show how far advanced the French were in house planning at this time.

Though the Renaissance was at hand in the XVIth century, and our house-builders were to learn much from Italy and France, the old English house plan of hall, screens, buttery, and kitchens, solar and private rooms, died hard. For 400 years our abbeys, our colleges, and our houses had been built on this plan.

The plan of Hengrave Hall, in Suffolk, marks the change from the house of the South Wingfield type to the Renaissance house. It was built in 1538, exactly 100 years after South Wingfield. More than a trace of the orderliness and symmetry which in this and the coming century were to be the distinguishing feature of our house plans is visible in this interesting building. The stable government of the XVIth century made fortified houses no longer a necessity. Artists from Italy and France instructed our house-builders in planning spacious courtyards and fine galleries.

The plans made by John Thorpe and Smithson in the reigns of Queen Elizabeth and James I illustrate the increasing power of the designer in house planning, and the change in customs and manners of the house-dwellers. To eat, drink, and even sleep in the hall was no longer the custom; rooms must be provided for dining and sleeping; handsome galleries and withdrawing rooms were called for by the craving for greater comfort. The ancient hall becomes now a fine vestibule, a means of entry to spacious staircase halls, with stairs of great magnificence leading to beautiful apartments on the first floor.

During the XVIIth century the movement in art, which had begun in the later years of the XVIth century, culminated in the full development of the Renaissance, and drew many young Englishmen to Italy for the purpose of studying the buildings of that country. Many were sent by wealthy noblemen, and records of these travellers exist. One there was who went on his own initiative, and who, on his return to England, altered the whole course of English domestic architecture. This man was Inigo Jones.

During his residence in Italy Jones studied chiefly the works of Palladio; and the principles in planning and design which he introduced in

gland and which he carried out himself in tual buildings were Palladio's, and naturally e course of house planning in this country was ich affected thereby. With Inigo Jones the rsonal influence of the architect became a minant feature, not only in the conception the design, but in the carrying out of the ole building. Stoke Park is an example of the lladian style. It was the first house to be ilt in this country with curved wings, and a pe of plan which for houses of a large size ted well into the XVIIIth century. The neral scheme in plans of this form consisted of e reception-rooms in the central block, and e kitchen offices in one of the wings, and the bling in the other; many a stately house was ilt on these lines, such as Buckingham House, or Park, Ditchley, Chesterfield House, and ughton.

The chief points to notice in these and other use plans of this period are—(1) That the ll has become a mere vestibule to more ately apartments; (2) the large "saloon" s taken the place of the hall; (3) the kitchen d service-rooms are either entirely on the ound floor, thus leaving the first floor, *piano nobile*, for the principal rooms; they are placed in a side wing, as at Stoke ark, an arrangement which is obviously nsatisfactory, as the separation of the dining- om from the kitchen is too pronounced. A mpler and a more workable plan, also by igo Jones, is that of Amblesbury, a type hich endured for very many years. The main ature on the ground floor is the hall; above it the first floor is the large room or saloon, the ight of two stories. The large porch in front the entrance hall, as I must now call it, rmed the base of a fine open portico above. he arrangement of the back staircase within e principal stair is a clever feature, borrowed om the Italians, but we shall see in later plans at a more convenient position was found for is necessary part of a house.

We have also to notice in these house plans of e XVIIth and XVIIIth centuries that the rincipal staircase is not quite so important a ature as in the spacious days of Queen lizabeth, which, as we have seen it, led up to e long gallery, the chapel, and the with- rawing-room. In passing it is interesting to otice the new development making itself felt the plan of Aston Hall (1618-1635), which as built from the design of John Thorpe at e same time that Stoke Park was being esigned.

A very interesting plan is Raynham, by Inigo nes (1636), a symmetrical and convenient an. Coleshill (1650) succeeds, and Thorpe, all by John Webb, Inigo Jones's assistant.

The following plans give some idea of hat was being done in the latter half of the ntury in the days of Sir Christopher Wren and is successors:—Eltham House, 1660; Groom- ridge (ascribed to Sir C. Wren), 1660; Belton scribed to Sir C. Wren), 1680.

It is remarkable that these XVIIth and VIIIth century plans were as noticeable for eir general want of privacy as any plan dating om the days before John Thorpe. He, as we ave seen in the plan of Beaufort House, under- ood the advantage of a corridor, from which the rincipal rooms could be entered; but the later esigners adopted to the full the Italian fashion building strings of rooms connected together y communicating doors. Sir Henry Wotton the early years of the XVIIth century con- emned this practice, but it lingered on till the nd of the XVIIIth century."

The lecturer then showed views of some Queen nne and Georgian houses, and illustrations of he origin of the French or Continental type of own house. Proceeding, he said:—"We shall otice that the modern plan marks an advance a good arrangement of rooms, in comfort and in rivacy, which is certainly amazing. It will, I ink, be clear to my audience that the architect f to-day has learnt much from the plans of the ast. He is mindful of the influence of the hall"—the focus, as we have seen, of the old nglish family life—of the long gallery, the tately staircases, and noble entrance, and arden courts of the great days of Queen lizabeth, the ordered symmetry and well- onsidered proportion which were the principal atterns of the house plans of the later English enaissance.

These form the basis of this art, while the easonable and sensible manner in which odern requirements and customs are met and rovided for indicate the progressive develop- ent of house planning in the present day."

ENGINEERING SOCIETIES.

Institute of Sanitary Engineers.

The Examination Board of this Institute, under the lead of their Chairman, Professor Henry Adams, M.Inst.C.E., recently submitted to the Council of the Institute a report recommending the reorganisation of their examinations upon a broader basis. The Council has now adopted the report, a new syllabus has been drawn up, and the Board of Examiners has been augmented. The new scheme will be in working order for the next examinations to be held in May, and particulars will gladly be forwarded by the Secretary upon request addressed to the offices, 120-122, Victoria-street, Westminster, S.W.

The Society of Engineers (Incorporated).

The following is an abstract of a paper on "Ligno-Concrete," by Mr. Gerald O. Case, read on Monday, April 1, at the Institution of Electrical Engineers:—In the introductory remarks, the author refers to the use in America and Australia of concrete in combination with timber, and points out that, while the concrete effectively preserves the timber, it is not used to the greatest advantage. The object of the author's investigations was to ascertain if it were possible to reinforce concrete with timber rods. Roughly speaking, steel is about eight or nine times stronger than timber, but ten to fifteen times as expensive. The efficiency of timber as a reinforcing material depends on whether there is sufficient adhesion between the timber and the concrete, and whether the difficulties of the absorption of moisture by the timber from the wet concrete, and the splitting the latter can be overcome.

The paper describes the experiments made by the author to ascertain (*a*) the amount of water absorbed by eighteen kinds of timber immersed in fresh water, along the grain and through the end grain respectively; (*b*) the relative absorption by the timber of fresh and sea water in the same period; (*c*) the relative amount of water absorbed by timber embedded in 6 to 1 concrete and neat cement blocks; (*d*) the effect of applying wood preservative, creosote, varnish, etc., to the timber before insertion in the concrete or cement blocks; (*e*) the effect on the adhesion between the timber and the concrete of soaking the rods before insertion. Examples are given to show that concrete effectively preserves timber embedded in it.

Particulars are given of the construction of twenty-five concrete beams reinforced by timber rods. Three ligno-concrete beams, 8 in. deep by 4 in. wide, were tested with a central load on a 4-ft. span; the average ultimate load producing fracture about 3 tons. The results of these tests are compared with the tests on ferro-concrete beams recorded by Mr. E. Marburg in the *Proceedings* of the American Society for Testing Materials (1904, Vol. IV.). It appears that for the same ultimate strength of beam it is necessary to use 9 per cent. of sectional area of pitch-pine tensile reinforcements as against 1 per cent. steel reinforcements. A comparison of the prices of steel and pitch-pine shows a saving in favour of ligno-concrete.

As the author points out, in cases where more than about 1·2 per cent. of steel reinforcement is required ligno-concrete cannot compete with ferro-concrete, because the required size of the timber bars would be too large for convenient use. There appears, however, to be a big field for it for use in constructing bungalows, buildings for small holdings, floors, piles, posts, fencing, coast and river works, etc. It has already been used for making fence posts and for building a short length of sea wall. The ligno-concrete fence-posts costs about 2s. per cube foot. They are about 20 per cent. cheaper than creosoted deal, and about 40 per cent. cheaper than English oak. In Canada, four bungalows have been built with ligno-concrete slabs, and the Pacific Coast Construction Company, of Victoria, British Columbia, now have contracts in hand for twenty buildings in which this material is to be used.

BOOK RECEIVED.

The Steel Square and Its Uses Simply Explained. (London: Cassell & Co., Ltd. 2s. net.)

GENERAL NEWS.

Professional Announcement.

Mr. R. W. Collier, F.R.I.B.A., has removed from 37, Lincoln's Inn-fields, W.C., to 5, Lancaster-place, Strand. Telephone, 10427 Central.

The Church of the Annunciation, St. Marylebone.

Plans have been made for the re-erection of this church, formerly known as Quebec Chapel, in Bryanston-street, which was remodelled and greatly improved by Sir Arthur Blomfield forty-five years ago. Mr. W. J. Tapper is the architect to the vicar and churchwardens for the proposed work.

Commendatore Walter Crane.

The portrait in oils of himself, which the Italian Government has invited Commendatore Walter Crane, R.W.S., to paint for the Uffizi Gallery, Florence, is now completed, and it will be shown, together with a selection of drawings and water-colours by this artist, at the Leicester Galleries, Leicester-square, on and after Saturday, 13th inst.

Campanile, St. Mark's, Venice.

On St. Mark's Day, the 25th of this month, will be opened the new campanile of St. Mark's, Venice. It is now ten years since the tower collapsed, its foundations having been undermined for centuries by the waters of the lagoons. During the ten years of restoration the work of Buono has been faithfully reproduced. A few months back saw the completion of the main structure, and there remained only the task of replacing the golden archangel on the pinnacle of the pyramid which crowns the tower. This figure is the work of Munavetti, and is made of brass, the head, arms, and feet being of massive bronze. The lily which the archangel holds in his hand measures 5 ft. 9 in. in length.

International Congress of Archæology, Rome.

In accordance with the decision of the second International Congress of Archæology, held at Cairo in the spring of 1909, the third Congress will take place at Rome from October 9 to 16, under the Presidency of Commendatore Corrado Ricci, Director-General of Antiquities and Fine Arts. There will be ten sections as follows:—1. Prehistoric Archæology; 2. Oriental Archæology; 3. Prehellenic Archæology; 4. Italic and Etruscan Archæology; 5. History of Classical Art; 6. Greek and Roman Antiquities; 7. Epigraphy and the Study of Papyri; 8. Numismatics; 9. Mythology and the Study of Religions; 10. Ancient Topography; 11. Christian Archæology; 12. Organisation of Archæological Studies. Those who desire to read papers or to bring proposals before the Congress are requested to communicate with the Secretary-General, Professor Lucio Mariani (to whom subscriptions for membership, 20 lire, should also be sent), Direzione Generale di Antichità e Belle Arti, 11, Piazza Venezia, Rome. It is hoped that it will be possible to keep the Archæological Exhibition open until the period of the Congress. Two special excursions will be organised in connexion with the Congress—one to Sardinia, the other to Magna Græcia and Sicily.

International Congress of Art, Rome.

The tenth International Congress for the History of Art will be held immediately after the Archæological Congress, from October 16 to 21 (in accordance with the decision of the ninth Congress, held at Munich in 1909 under the Presidency of Professor Adolfe Venturi. The discussions will deal with subjects of general interest in the history of art, and more especially with the relations between the art of Italy and that of other nations. The sections will deal respectively with Christian, Romanesque, Gothic, and Renaissance, and Modern Art; while a fifth section will discuss problems connected with organisation and methods of co-operation between workers of different countries. The cost of tickets of membership is 25 lire, but members may obtain tickets for ladies of their family for 10 lire. Visits have been arranged to the principal private collections of Rome and

its neighbourhood, for which, as a rule, permission can only be obtained with great difficulty. Further information can be obtained from the Secretary-General, Dr. Roberto Papini, Via Fabio Massimo, 60, Rome. It is requested that those who may desire to bring communications before the Congress will inform him without delay.

Sanitary Engineering Exhibition, Milan.

A Sanitary Engineering Exhibition, under the patronage of the Royal Italian Society of Hygiene, will be held from April to July at Milan, Italy. The exhibition is "to encourage and reward every progressive show in the field of practical hygiene as applied to civil engineering and architecture; to bring before interested parties whatever has been done in recent times in Italy and abroad and the best in this branch; to constitute a first collection of materials, samples, models, and drawings with the ultimate object of transforming the present temporary show into a permanent sanitary museum under the patronage of the Royal Italian Society of Hygiene, to be associated to the existing Museo di Igiene Sapolini." There will be an exhibition of materials, samples, models, drawings, projects, photos, pamphlets, books, etc. The programme sets out the following "groups" covering the interests of the exhibition:—A (Historical show)—History, Description, Legislation, and General Propaganda; B—Hygiene of Modern Cities and Roads; C—Modern Sanitation Town Dwelling; D—Water Supply; E—Sewers, Modern Refuse Disposal and Treatment—Destruction of House and Road Sweepings; F—Lighting; G—Ventilators, Ozonisers, Exhausters; H—Hygiene of Workshops, Quarries, Mines; I—Hygiene as Applied to Agriculture; L—Slaughterhouses, Dairies, Markets, Bakeries; M Schools, Children's Gardens, Colleges; N—Gymnasiums, Sporting Places, Theatres, and Meeting-rooms; O—Prisons and Barracks; P—Hospitals, Isolation Hospitals, Lunatic Asylums, Sanatories, Disinfection Apparatuses; Q—Baths and Washhouses; R—Cemeteries; S—Climatic Stations, Summer and Winter, Villas, Hotels, Sanatories, Alpine Colonies, Sea Hospitals; and T—Sanitary Transportation. Gold, silver, and bronze medals will be awarded.

Conversion of a West London Market.

A scheme is formulated to convert Portman Market, in Church-street, Marylebone, into a motor-car garage and depôt. The existing buildings were erected in 1900-1, at a cost of about 46,000*l.*, for Portman Market. Ltd., after the plans and designs of Mr. H. T. Gunton, of the firm of Messrs. Gordon, Lowther, & Gunton, and extend over an area of 43,500 ft. superficial. The company was formed to take a lease of the site from Lord Portman for a term of fifty-eight years from Lady Day, 1899, at a ground rent, after the first two years, of 1,030*l.* per annum. The vendor, Mr. John Baker, had fixed the purchase price of his lease and market rights at 40,000*l.* The premises were opened on April 18, 1901, for the sale of meat, fish, and vegetables; but the market was offered for sale in the autumn of the next year. It was reopened in August, 1905, for a wholesale trade in fruits, flowers, vegetables, and other garden produce. In October, 1906, the property, having a rateable value of 800*l.* yearly, was again offered for sale at auction. Portman Market was established upon the present site—on Viscount Portman's Lylleston estate—in pursuance of the Act 11 Geo. IV., cap. 71, additional powers being obtained under an amending Act 2 and 3 William IV., cap. 113. The buildings comprise 175 stalls and stands divided by diagonal and straight avenues, a large central cold storage beneath the dome, and a separate installation of electric light, and thirty shops in ranged terraces along the main frontage, 256 ft., to Church-street, and along three other streets, in close proximity to the goods terminus of the Great Central Railway.

Harrow Aerodrome.

The National Aviation Company, Ltd., have acquired an estate of more than 350 acres, between Harrow and Ruislip, which is a portion of the area that is covered by the Ruislip Manor and town-planning scheme. Northolt Junction Station on the Great Western and Great Central lines adjoins the south-west corner of the estate; to the north are the Eastcote and South Harrow stations of the Metropolitan Railway. The proposed plans provide for an aviation ground of 256 acres adjacent to the junction station, with storage hangars and workshops, and, on the site of the Bourne Farm House, a clubhouse, with restaurant, cricket ground, lawn tennis courts, etc. Surrounding the aviation ground to the south and east will be plotted a boulevard, 60 ft. wide, with shops, houses, and villas, so planned as to afford large open-air spaces, separate house gardens, and recreation grounds.

Open Spaces and Recreation Grounds.

A committee is appointed to secure the vesting in the National Trust of the summit of Finchampstead Ridges, portion of the Bear Wood Estates, Berks, which are included in the contemplated sale of the Sandhurst Lodge property near Wokingham; the Ridges consist of 143 acres of forest land commanding extensive prospects in Berkshire, Hampshire, and Surrey. It is also proposed to acquire on behalf of the National Trust the manorial rights of Minchinhampton Common, lying near Amberley and Woodchester, on the southern verge of the Cotswolds, in respect of which Major Ricardo, lord of the manor, has consented to give an option of purchase until May 1 next for 1,250*l.* (about 2*l.* per acre), a sum that represents the income now derived from the quarries; on the hill are extensive earthworks enclosing pit dwellings. This beautiful spot—the "Enderley Flat" of "John Halifax, Gentleman"—lies on the south-eastern slopes of the Cotswolds, near Strood and the Woodchester Valley. The place takes its name from the Minchin nuns of the church that appertained to the Abbaye aux Dames of Caen, who settled there *temp.* Henry III.; but upon the surrender by alien monasteries the nunnery passed to Sion in Middlesex. In the reign of Henry VIII. Alice de Hampton gave a grant for pasturage of the common land and Amberley Bank to the poor villagers; the manorial rights extend over about 600 acres. The Trust have just obtained, by bequest of the late Mr. G. H. Verrall, of Newmarket, a tract of land in Wicken Fen, near Upware, Cambs, which has suffered but little change since British times, and is the habitat of plants and insects found nowhere else in England. The Wandsworth Borough Council have agreed, conditionally, to contribute 3,000*l.* to the purchase, for 12,000*l.*, of 20 acres which belong to the Royal Patriotic Asylum, for an enlargement of Wandsworth Common. A sum of about 2,500*l.* is needed to secure a beautiful expanse of meadow and garden land which adjoins Valentine's Park, Ilford, and is now owned by the Ilford Garden Suburb undertaking. Sir Thomas F. Buxton has conveyed to the Conservators of Epping Forest some land on the approach to Copped Hall Green, and the lake at Wanstead Flats has been enlarged and improved.

London in the Reign of Elizabeth.

Amongst the exhibits that will be constructed for the show of "Shakespeare's England" to be opened on May 11 in the Earl's Court grounds are full-sized models of Staple Inn, the Globe Theatre, Bankside, and the Mermaid Tavern, in Bread-street, Cheapside, celebrated in verse by Francis Beaumont and Ben Jonson; Mr. E. Lutyens will superintend the preparation of the models of St. Mary's and Ford's Hospital, Coventry, Windsor cloisters, and Ledbury Hall. The Elizabethan Literary Society have formulated a scheme for the preparation of a map of London as in the days of Queen Elizabeth. It is intended to mark upon the map sites, places, and buildings which are associated with the literary and social history of the town during the period of about eighty years that ended with the death of Massinger in 1640, or which possess other interest, and to plot the lines of the streets as contrasted with those of modern times.

Old Houses in Haslemere.

Under this heading Sir Robert Hunter calls attention in the *Times* to a group of old houses in the little town of Haslemere and the threatened destruction of them. The London County and Westminster Bank, it appears, find the premises too small. Mr. Thackeray Turner, Chairman of Com mittee, the Society for the Protection Ancient Buildings, in the course of a rep to Sir Robert Hunter, says:—

"If the two projecting gables which for the centre of the group of old cottages a cleared away what remains will be of h small value. But I have studied the situatio carefully, and I am convinced that a skilf architect could perfectly well meet the requir ments of the bank by pulling down the portio of the buildings next the hotel, which are no great value, and retaining the projectin wing with its two gables and the roof an old chimney behind them. He could the build upon the cleared site a good bar frontage, utilising the space on the groun floor under the projecting gables and makin the new front of brick, keeping it quiet an in harmony with the old work."

Southampton Bargate.

The Estates Committee of Southampto Corporation have now received a detaile report on the subject of the Bargate from th Society for the Protection of Ancien Buildings. Mr. W. Weir, who makes th report, suggests that the three corbels whic support the projecting portion of the parap are in danger of breaking off, though in goo repair, owing to there being no other suppor Various suggestions of minor importance ar made which the Committee recommend shoul be carried out where advisable. The Borou Engineer also reports on the matter, and the result the Committee recommend th renewal of the three top corbels in Portlan stone.—*Southern Echo.*

Road Board Specifications.

Representations having been made to th Road Board as to the difficulty at the prese time of obtaining from gas works in ar about London and in some other distric tar or pitch which complies in percentage free carbon with the Road Board Specificatio for Pitch and for Tar No. 1 and Tar No. 2, th Board, as a temporary measure, in order allow time for arrangements to be made for th supply of tar and pitch containing no mo than the specified percentages of free carbo have, on the advice of their Advisory Engineerin Committee, decided to modify the percentag of free carbon as follows:—In Tar No. (Specification No. 4) the percentage should no exceed 20 per cent. In Tar No. 2 (Specificatio No. 5) the percentage should not exceed 21 pe cent. In Pitch (Specification No. 6) the pe centage should not exceed 31 per cent. Thes modifications will be operative until Decembe 31, 1913. It should be distinctly understood however, in contracting for the purchase of ta or pitch that the value of the material for roa purposes lessens with the increase of the pro portion of free carbon which it contains. A fair estimate would be that each 1 per cen of free carbon in excess of the percentage mentioned in Road Board Specifications 4 5, and 6 lessens the value to the extent of fro 5 per cent. to 7½ per cent. of the price.

The City of London Year-Book and Directory

The 1912 edition of this work, which is guide to the municipal, commercial, and socia life of the City, contains much valuable informa tion. The Municipal section gives the name of the members of the Corporation, Londo County Council, Livery Companies, and othe bodies. There is a list of the various Cit churches with names of the clergy; of th clubs and social institutions, hospitals, etc Altogether the work forms a very useful an interesting book. It is published by Messrs W. H. & L. Collingridge, Aldersgate-street, E.C

PUBLIC WORKS SCHEME, CHILE.

With reference to the notice on p. 231 o the *Board of Trade Journal* of February relative to a Chilian Government Bill for th construction of railways, hydraulic and irriga tion works, and public buildings in Chil during the ten years 1912-21, it is notified tha full particulars of the scheme have now bee received from H.M. Legation at Santiago H.M. Legation point out, however, that it considered unlikely that the proposals will b accepted by Congress. The particular referred to above (in Spanish) may be see by British firms at the Commercial Intell gence Branch of the Board of Trade, 7, Basinghall-street, London, E.C.

EDITORIAL SUMMARY.

The leading article, illustrated, is entitled "A Papal Pleasure House." Some illustration plates of the Villa Pia, the house in question, are also given this week.

In "Notes" columns (p. 388) will be found observations on: "Competition Ethics Again"; "The Strike"; "Architecture and Local Patriotism"; "The Question of Acoustics"; "Monuments in Our Parks."

A notice of the Royal Society of British Artists' Spring Exhibition appears on p. 389.

A meeting of the Royal Institute of British Architects was held on Monday, when Mr. E. T. Hall read a paper on "Art Museums and Picture Galleries." Our report is given on p. 389.

Some notes on a recent competition for St. Peter's Church, Acton, appear on p. 391.

A note of the sixth visit of the Architectural Association this year is given on p. 391. The building visited was the Wesleyan Church House, Westminster.

The tenth and concluding lecture of the series of Carpenters' Hall lectures on the Arts Connected with Building was delivered on Wednesday last week by Mr. Gerald Horsley on "Influences in the Development of Planning" (p. 392).

In Correspondence columns (p. 395) are letters on: "Spiral Pillars"; "London: Its New Royal Museum and New 'London Society.'"

The Monthly Illustrated Review of Civic Design (p. 397) includes: "The Prestatyn Estate Competition"; "Town Planning"; "Imperial London"; "The Wellcome Tropical Research Laboratories"; "*The Town Planning Review*"; and Notes.

The Building Trade Section (p. 402) includes: "The Ideal Builder"; "Land Valuation"; "The London Association of Master Decorators"; "Applications under the London Building Acts."

An article on "The National Physical Laboratory" is given on p. 405.

An article on The International Smoke Abatement Exhibition, Royal Agricultural Hall, appears this week on p. 405.

Book Reviews (p. 406) include "School Planning"; "History of Bridge Engineering"; "Practical Sewerage and Sewage Disposal."

In "Legal Column" (p. 407) are notes on: "Surveyors' Fees"; "Trade Union Law"; "Powers of Corporations—Municipal Trading"; "Extraordinary Traffic on Highways"; "Vendor and Purchaser."

Our Law Reports (p. 408) include: "Stronge and Others *v.* Beadel, Wood, & Co."; "Reading Industrial Co-operative Society, Ltd. *v.* Palmer"; "Tolley *v.* Lichwitz & Co."

MEETINGS.

Thursday, April 11.

Concrete Institute.—Ordinary general meeting. 8 p.m.

Society of Architects.—8 p.m.

Saturday, April 13.

Edinburgh Architectural Association. Visits to (1) Holyrood Palace and Chapel; (2) Thistle Chapel.

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society.

On the 26th ult. this Society concluded their winter programme with an informal smoking concert at Calvert's Café. There was a record attendance.

The principal designs sent in competition during the session were on exhibition, and, in addition, Mr. Arthur Marshall, A.R.I.B.A., lent over forty of his own pencil drawings and etchings for the inspection of the members.

The drawings are all unique specimens of artistic composition, and the quality and texture of the drawing are very beautiful, and the privilege of inspecting them was greatly appreciated by the large number of members and friends present.

The Society offer prizes annually for the best set of architectural drawings designed by the students.

In presenting the prizes to the successful competitors Mr. Robert Evans, F.R.I.B.A., the President, announced that it was a dead heat for the first prize, and the student who secured the second prize was very few points behind them.

The awards were as follows:—Bracketed first, Messrs. Hasledine and Pratt; second, Mr. Beaverstock. Mr. Evans announced that he would give a prize to the student who submitted the best sketch-book next session.

At the request of the President, Mr. Marshall gave an interesting brief description of his drawings, and at the same time described his own methods of working and the materials he used.

On the motion of Mr. E. R. Sutton, a hearty vote of thanks was accorded to Mr. Walker and the artists who had assisted him, and to Mr. F. M. Royle, the Hon. Secretary, for arranging such a successful evening.

The annual meeting and election of officers will be held on Tuesday, April 23.

CORRESPONDENCE.

London: Its New Royal Museum and New "London Society."

Sir,—Besides its vast size, London is unique in another respect. Though the largest city in the world its citizens take no pride in being citizens even of the metropolis of the Empire in the manner of those of Paris, New York, or Berlin. They do not go about proclaiming themselves to be Londoners, and if they have to confess to it they do it in a deprecating way, not wanting to be classed as Cockneys. No one even claims to be a Middlesex man, like those born more fortunately in other counties. There is no *esprit de corps* or bond of union between us, and to be known as a Londoner does not particularly help a professional or commercial man. Neither is it a recommendation to the operative or craftsman to be bred and born in London, though it sets the fashions, while it is no benefit to be born a Londoner: as matters go, it may be a positive handicap. Take the case of a musician or singer with a way to make in the world. Were he or she Scotch, Irish, or Welsh, Canadian or Australian, sympathetic compatriots are to be found everywhere ready to foregather. Even the Devonian, Salopian, Yorkshireman, or Lancastrian meet with *camaraderie* and fellowship entirely denied to Londoners. The causes are more easy to explain than to remedy, and for this reason, if for no other, both the Royal London Museum and the London Society should be heartily welcomed as steps in the right direction. Without visible funds the establishment of the former on any commensurate scale appeared a hopeless undertaking, but, thanks to the talented and indefatigable curator, Mr. Guy Laking, it has become a reality in an incredibly short space of time. The case is really remarkable as it was heralded by no preliminary agitation; there was already a museum in the Guildhall in existence, and all the unique and valuable objects found in London during previous centuries were safely housed in the great metropolitan museums, which cannot be called on to disgorge them.

The London Society has still to consolidate into fact, against difficulties even more insurmountable. Though numbers join it, views must be hopelessly divergent, and only the most uncommon tact, energy, enthusiasm, perseverance, and unanimity on the part of the promoters can make active and effective steps in the direction of great London improvements possible.

J. Starkie Gardner.

Spiral Pillars.

Sir,—There was an interesting list of spiral pillars in the *Builder* lately. They seem to have come from the East. May I suggest that perhaps those mysterious pillars called Jachin and Boaz, in Solomon's Temple, were spiral columns? The synagogues at Rotterdam, Vienna, two churches in Toledo, formerly synagogues, Nabludon, Casimir, Teheran, have spirals in them. Also the Armenian church at Tortoon and the throne at Teheran. A yad (pointer) used by the synagogue reader has a spiral stem. In the Cluny Museum is an ancient metal case to hold the Law, with spirals at the four angles. At New York is a breastplate for the scroll of the Law, having two spirals. The almenar (reading pew) of the Casimir Synagogue has its dome supported by spirals. A Jewish marriage contract, 1659, has spirally-wreathed columns. A Jewish Bible of Amsterdam, 1679, has Moses and Aaron between spirals on the title. Some of these are very old. Engravings of them are in the "Jewish Encyclopædia."

Being at Jerusalem in 1908, I visited the Holy Sepulchre, and the front of the Tomb chapel has four spiral columns. The first was built by Constantine, A.D. 326, and probably the later chapels reproduce the general features. Bartlett has engraved it ("Walks About Jerusalem"). At the Victoria and Albert Museum is the large cartoon by Raphael of the Beautiful Gate of the Temple, and the pillars are spiral. Hanner mentions that the Saracenic gateway of the Haram area has spiral columns, called Bab es Sileleh (gate of chains), of the XIIIth century, but founded on a Jewish gateway, whose pavement remains ("Walks About Jerusalem," 1910).

Sumner mentions seeing the mosque El Aksa, in the Temple area, built by Justinian, formerly called the Palace Porch or Temple of Solomon, and remarks:—"In many places pillars of twisted marble with graceful capitals are built into the walls, taken in all probability from the old Jewish Temple" ("Our Holiday in the East," 1887, p. 106).

And Hanner mentions that the Moslems of Jerusalem believe Solomon to have invented spiral columns (p. 221). In the Septuagint Jachin and Boaz are said to have "flutings" (3 Kings, vii., 15), and the spiral columns of Raphael have spiral flutings or grooves. In the mosque of Omar, in the Haram area, is a pulpit, flanked on either side with double-twisted columns.

These instances seem to show that spiral pillars came from the East, and connect them specially with the Jews, and the Arabs, the cousins and successors of the Jews in Jerusalem, copied them. And the Christians there may have found Jewish spirals among the *débris*, while tradition connects them with Solomon himself.

A. B. G.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held in the County Hall, Spring-gardens, S.W., on Tuesday, Lord Cheylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended and it was agreed to make a loan of 18,000*l.* to the Hammersmith Borough Council for street improvements, and to the Southwark Borough Council a loan of 4,456*l.* for electricity undertaking.

School, Kennington.—It is proposed to make various alterations at the St. Saviour's Salamanca School, Kennington, by providing internal office accommodation and an additional teachers' room.

Victoria-embankment.—Repairs are to be carried out and tar macadam laid on the Victoria-embankment at an estimated cost of 1,200*l.*

Painting, etc., at Parks.—Various painting and tarring work and repairs are required at the several parks and gardens during the ensuing summer, and it is proposed to execute these works by direct employment of labour at a cost of about 4,508*l.*

Theatres, etc.—The Theatres and Music Halls Committee have approved the following drawings:—75, Balham High-road (Theatre de Luxe)—Proposals for improving the steppings in the balcony; Earl's-court Exhibition—Arrangement of proposed concert hall in the Queen's Palace; His Majesty's Theatre Adaptation of certain rooms in the basement as property rooms; King's Hall, 83, Commercial-road, Stepney Provision of a rewinding room; London Pavilion, Piccadilly-circus—Provision of a dressing-room; New Cross Empire—Adaptation as waiting-rooms of the stalls and circle bars and alterations to the cinematograph chamber; 225, Oxford-street (Cinema House)—Electric wiring of premises; Putney Hippodrome Rearrangement of cinematograph chamber.

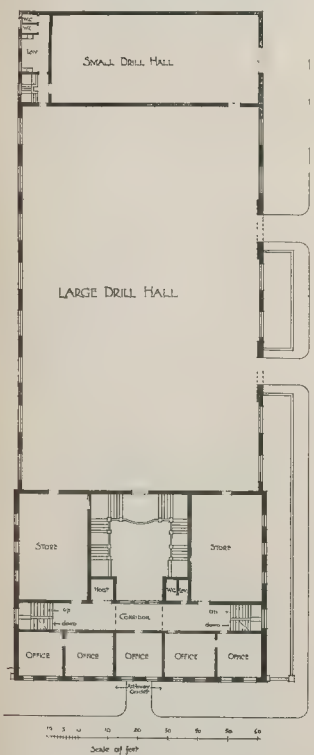
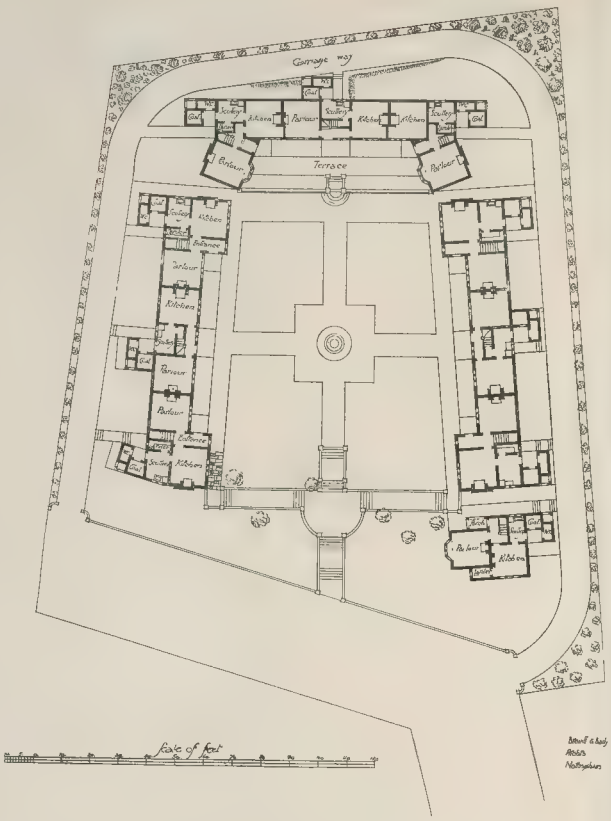
THE illustrations of this building are in connexion with the article which begins on page 385.



Territorial Force Headquarters.

THESE new premises for the Territorial Force Association of the County of Nottingham have been erected from the design and under the supervision of Messrs. Brewill & Baily, architects, Parliament-street, Nottingham.



The premises are erected to accommodate the modern requirements of the Territorial Force and form the centre for all Territorial Units in the City of Nottingham, which include one battery Royal Horse Artillery, the South Notts Hussars, the 7th Battn. (Robin Hood) Sherwood Foresters, one company Army Service Corps, and one company Mounted Brigade Field Ambulance, the accommodation being for the storage of guns, waggons, vehicles, clothing, and equipment, etc., for all arms; also drill halls, miniature rifle ranges, offices, lecture-rooms, together with caretaker's residence.

The building has been designed in the Georgian Period with a stone rusticated basement, having a central archway leading to the court from which the principal premises are entered; the upper portion is erected with red bricks, and the centre being relieved by stonework broken by pilasters, the parapet to the centre portion also being relieved by stone balusters.

The general contractors were Messrs. Wm. Maule & Co., the stonework has been executed by Messrs. Pask & Thorpe, and the plumbing by Messrs. Humphrey & Co., all of Nottingham. The whole of the floors are fireproof, and have been carried out by the Yorkshire Hennebique Contracting Company, Ltd. The roof to the main block is covered with Val de Travers asphalte, and the wrought-iron gates and railings have been made by Mr. Starkie Gardner; Messrs. Roger Lowe & Co. executing the wood block flooring.

Messrs. Brewill & Baily, FF.R.I.B.A., Architects.

Proposed Almshouses, Nottingham.
Messrs. Brewill & Baily, FF.R.I.B.A., Architects.

Proposed Almshouses, Nottingham.

THIS competition design was sent in by Messrs. Brewill & Baily, architects, for the erection of ten almshouses for the Wilkinson Smith Trust, at Nottingham.

It was proposed to erect the buildings in brick with stone dressings, the centre portion of the gables being constructed with half-timber in oak.

FIFTY YEARS AGO.

From the *Builder* of April 5, 1862.

Marc Isambard Brunel.

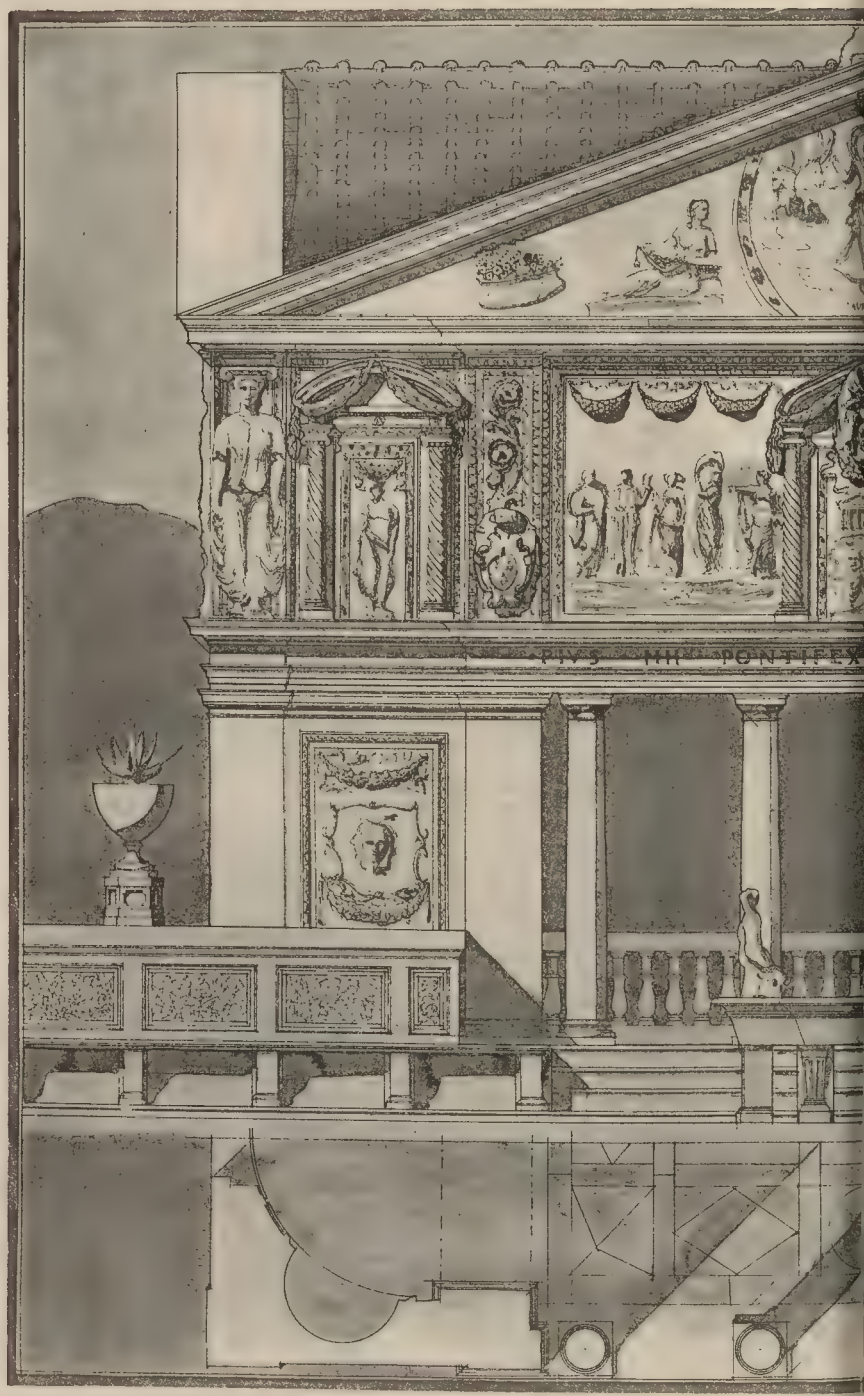
GENIUS is a fearful gift. Its pleasures and its triumphs are intense, but so are its pains and penalties. Men of genius dwell, as it were, in a world of their own, apart from the worldly life; and there are few among the gifted who can fully enjoy both worlds. Genius is not incompatible with worldly wisdom, but it too often aims at independence of it, and sorrows and difficulties are the sure result. The imprisonment of Brunel when his business at Battersea fell into confusion, much of the pecuniary shortcomings and shabby treatment of the Government, and many other worries and annoyances of his life are far too like those so frequently experienced throughout the lives of eminent men of genius to be altogether ascribable to the defects of others. The very daring of his own inventive faculty as in the case of the Thames Tunnel, and perhaps a hasty impatience of maturisation in details, must have aided not a little in bringing down upon his devoted head much grief and annoyance. He himself declared that if he had another work of a similar kind to do he would do it differently. This, it is true, might have been said by any other engineer. However, in future time, so far as regards the Thames Tunnel, although it may continue to be an interesting question how it was done, and criticisms as to better ways of doing it may still be urged, the great inquiry will be, who did it? And the name of Brunel, and the skill and daring of the work, will be all that posterity will care to think of in regard to it, at a time when the "Thames Tunnel Company," its immense outlays, and its failure as a commercial speculation, will be all forgotten.

COMPETITION NEWS.

Church of St. Peter, Acton Green.

The first place in the competition for this Church has been awarded to Mr. W. A. Pite, F.R.I.B.A. All the designs submitted are described on page 391.

Harrow Public Offices.



In the competition for alterations to the public offices of the Harrow-on-the-Hill Urban District Council the first premiated design is announced to be by Mr. H. Prince, A.R.I.B.A., 19, Old-square, Lincoln's Inn, W.C. The second premiated design is by Mr. E. E. Fetch, A.R.I.B.A., 20, John-street, Adelphi, W.C., and the third by Mr. H. Burgess, Queen Anne's-chambers, Broadway, Westminster, S.W. The designs of Mr. S. Pointon Taylor, Harrow, and C. H. Rose, Wimbledon, were commended.

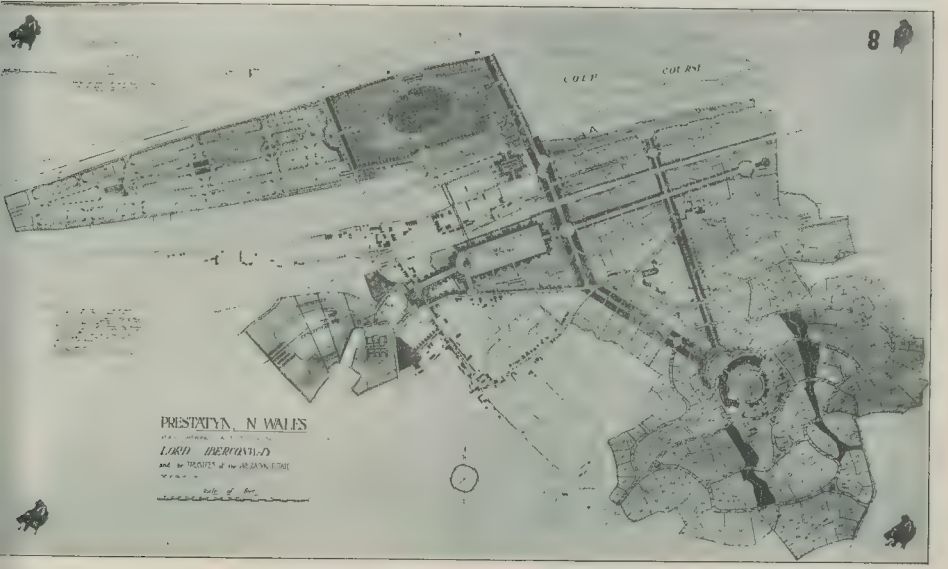
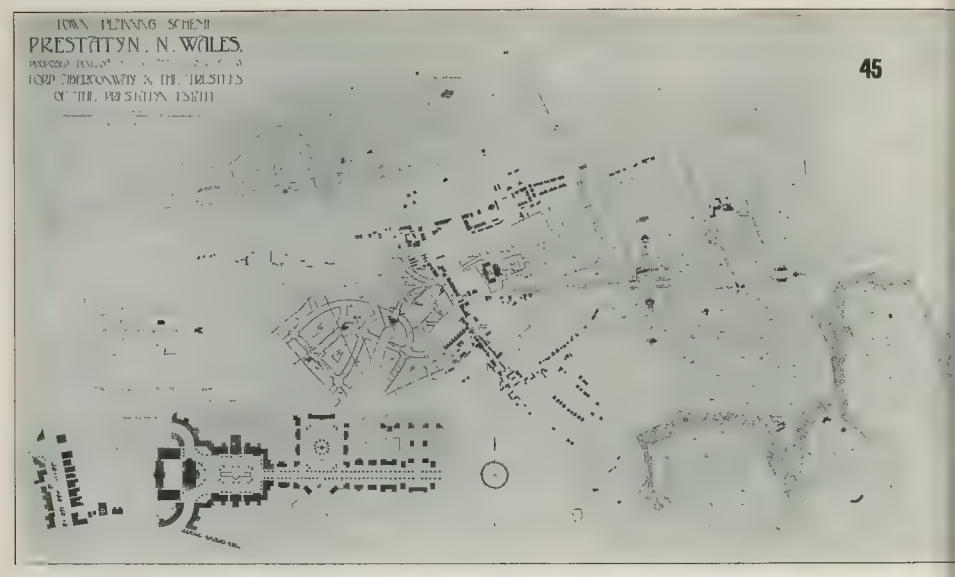
MONTHLY REVIEW · *of* · CIVIC DESIGN.



First Premiated Design, by Mr. Patrick Abercrombie, Mr. E. L. Bower, and Mr. T. F. Shepheard.

PRESTATYN ESTATE, NORTH WALES.



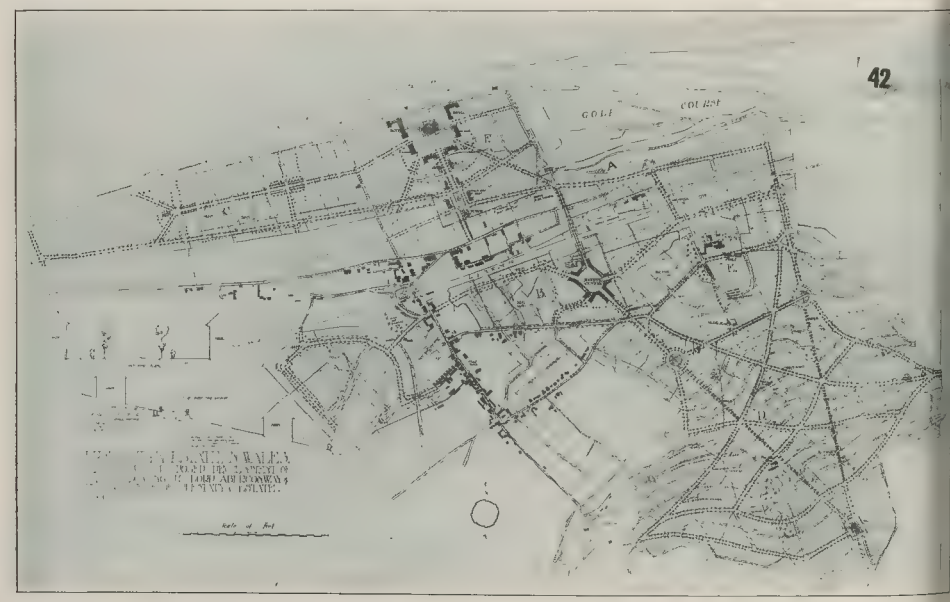
COMPETITION FOR LAY-OUT.

THROUGH the courtesy of the promoters, the trustees of the Prestatyn Estate, we are enabled to publish this week the designs premiated by the assessor, Mr. H. V. Lanchester, in this competition, together with those marked by him as "proxime accessit."

The estate comprises three areas nearly isolated from each other, two of these being almost equal in importance, and the third subsidiary to them. This must have involved a certain difficulty in the adjudication, for it would be unlikely that any one competitor would achieve the best solution in both cases, and the position might be likened

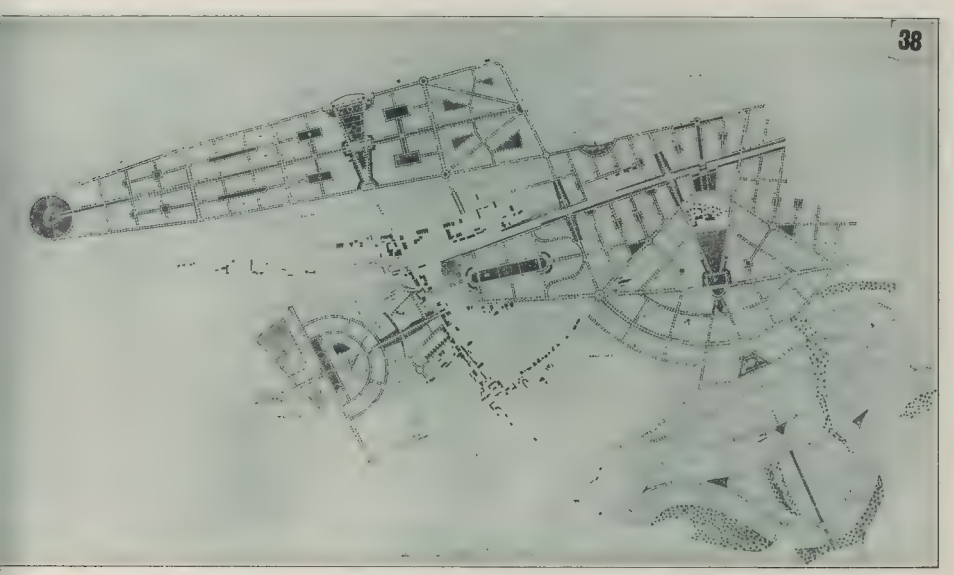
Second Premiated Design, by Mr. Harold Falkner.

Third Premiated Design, by Mr. Reginald Dann, of Messrs. Cheal & Sons.



to a prize in a flower-show to be awarded to the gardener showing the best rose and the best cucumber. Add to this the condition that the rose and cucumber should form a good table group with the addition of an apple, and the simile is more complete.

The first premiated design, by Messrs. Abercrombie, Bower, & Shepheard, is more noticeably successful in the planning of the waterside area, where the middle of the strip of land behind the sand dune is marked by a well-arranged sheltered boulevard with the social centre in its proper place, and the buildings composing it particularly well arranged in relation to each other. The steep hillside to the south is treated somewhat sketchily, though on the right lines, but the design fails to take full advantage of the possibilities in connecting this hillside with the sea front.



This connexion has been strongly emphasised in the design by Mr. Harold Falkner, placed second, whose idea in marking the termination of his principal avenue with a convex crescent appears an excellent one, as a means of affording a centre of interest amid the necessarily somewhat scattered effect of the general distribution of houses on an irregular hillside. The seaside is, however, far less successfully han than in the first design.

The design by Mr. Reginald Dann, pl third, also fails to some extent in the lay of the portion by the sea, the main boule suffering from too many intersections a acute angle, but the means of conne between the various sections of the e are carefully studied, and the main winding up the hill has been worked with greater skill than is to be found i design of any other competitor.

Two other designs have been h

Highly Commended : Design by Messrs. Geoffry Lucas, F.R.I.B.A., & F. Lodge, A.R.I.B.A.

Highly Commended : Design by Messrs. H. J. Rowse, A.R.I.B.A., & Sydney A. Kelly, F.S.I.

nended by the assessor. That by Messrs. s & Lodge appears to be a thoroughly d, businesslike scheme, and, even if it not display an imaginative outlook, it obviously have run the premiated ns very close as an eminently sane and ical solution of the problem. The only us defect that strikes us is the undue ness of some of the main roads on the a defect that it shares with the design d second.

e plan by Messrs. Rowse & Kelly is on general lines as regards the lower id, but we should say that they have their chance by endeavouring to ce a symmetrical lay-out on an irregular le. Symmetry in such a position is estionably absurd, and when it involves ssible gradients the mistake should been obvious.

r criticism of the designs is limited ose selected by the assessor, as we are le to notice the designs of other com- ors, except to say that they included good schemes.

IMPERIAL LONDON.

By Wilmot Corfield.

e broad basis of the design for beautifying on, ably illustrated by Mr. Adrian ington in the *Builder* of January 5. its accompanying article, calls for a response of friendly criticism and support. acceptability of the scheme for an perial way" on the Surrey side is ngly obvious, as also is the practicability e desirable improvements suggested for Middlesex side.

lumes might be written on points arising f the proposals, but the first thought to to one is that before any really extended ment in the direction of public improve- s on a large scale can be successfully urated the law as regards compulsory sition of buildings and sites must be ied and strengthened.

recent decision to disregard St. Paul's dral as the dominating factor in fixing ourse of a new bridge across the river ht into prominence an aspect of the rights of a community desiring to possess en site for public improvements. The to acquire it is admitted, but not the to upset an owner of property off the f the improvement in order to obtain a le site to meet the requirements of a ssessed owner on the line. A medical man "A" occupies a house at a given corner required for purposes of widening a street. He may be compulsorily bought out, but "B's" adjoining property, which would equally suit "A's" purpose, cannot be compulsorily acquired, and "A" has to be heavily compensated for the loss occasioned to his practice by removal to a distance. The principle of compulsory acquirement of private property for the public good having been accepted, it is a grave question whether its scope should not be enlarged so as to cover with the upsetting of "A" the upsetting of "B" also, in view to the proper putting through of an improvement, as a whole, upon economical and comprehensive lines. Until this extension is accepted by legislative enactment delay and expense must result. A freer hand for authority is demanded before London's wholesale beautification can be brought about.

In the published drawing a new Buckingham Palace covers the site of the existing one. The new Palace should be further back from the Mall and clear of that now occupied. By this two advantages would be gained: the Royal residence would not be upset during the replacement, and the Victoria Memorial would win eventually between it and the Palace a privately enclosed vista of lawns and trees, greatly adding to the charm of its surroundings.

Charing Cross should (with the permission of the railway company owning it) be transferred to the centre of the open space on the Trafalgar-square side of the Mall archway, additional reason for this removal being found in the fact that the Cross would then be nearer the ascertained actual site of its original. The Strand could then be widened at the expense of part of the station yard, pending the ultimate transfer of the station itself to the other side of the river. The opening of the Mall between Drummond's Bank and the nearest building left standing, at present nameless, should be christened "Rivett-place," in memory of John Rivett, the brazier, who preserved for posterity Le Sueur's statue of Charles I. from the destruction it was thought had befallen it. Lord Herbert of Lea, hidden in the War Office courtyard, might join Florence Nightingale in York-place. It is of interest to note that *Punch*, as long ago as 1861, proposed and depicted a statue in Pall Mall to "the Lady with the Lamp."

Mr. Berrington provides for the National Theatre on and about the site of the Adelphi Theatre. A better position for it would be on the Surrey side, as nearly as possible to a point on the "Imperial way," known to have been the spot where a theatre of Shakespeare's own days stood. Such a point would be in the future brought more within the borders of a London suited to the pleasure-seeker by the beautifying of the surroundings of Southwark Cathedral. Some day London will realise the injustice done to Shakespeare's memory by preserving the ineffective statue to him in Leicester-square, the wrong place for it. The statue is not an ignoble one, and its transfer to the precincts of the Cathedral might well be considered. The old Buckingham Water-gate could be reconnected by inlet with the Thames, and used on special occasions for river pageants. The re-erection of the Westminster Court house should be carried out elsewhere, and the site of the demolished building left to turf together with that of the hospital (to be also removed elsewhere), now obscuring the view of the new Wesleyan Hall. An Abbey annexe for the reception of monuments to the dead who have passed away since Queen Victoria's decease is urgently needed, and to it should be removed the Salisbury and Campbell-Bannerman memorials. The fine range of Royal statues in Westminster Hall should be supplemented by others to Victoria and Edward VII., while those Members of Parliament who find their unasked-for salaries an inconvenience might pool them for the further provision of statues, frescoes, and other decorative paintings in the Parliament House. The "piked head" supposed by some to be that of Cromwell, frequently supplying newspaper copy, ought to be finally buried under the Cromwell statue near Westminster Palace-yard. The spot of Nelson's coffin's resting-place in the Greenwich Painted Hall should be permanently indicated by a brass inscription let into the floor.

Chantrey's statue to George IV. in Trafalgar-square was originally intended for the top of the Marble Arch when that structure faced Buckingham Palace. Its removal to the Arch in its present position is now suggested. The relegation of these two grim-looking warriors, Sir Charles Napier and Sir Henry Havelock, to positions on either side of the York steps leading from the Mall would leave the four angles of the Square free for five men of action—Gordon (now dwarfed to a needless extent by the Nelson Column) and Clive, Cook, and Wolfe, now under preparation. The protest is now made against the banishment of Clive to King Charles-street; the proximity of the India Office is apparently the only reason for placing the recoverer of Calcutta and victor

at Plassey in so little used a thoroughfare. The India Office already possesses a "Mason's effigy" to his memory. No site in London is too good for Clive. In 1907 the present writer in Calcutta advocated a statue in that city. By a curious coincidence, upon which the local Press commented at the time, just three days afterwards, Lord Curzon, in London, started in the *Times* the movement now culminating in the erection of twin statues in London and Calcutta. This writer did not a little by voice and pen to keep alive the scheme in the East, and his hope is that attention may be called before it is too late to the perpetuation of a mistake to be afterwards regretted.

A representative Indian Hall similar to Calcutta's great Victoria Memorial should grace the "Imperial way" near Waterloo Bridge, hard by a new London University building erected also on that side. These might interfere with the continual nightly exhibition of illuminated advertisements of certain liquid refreshments, but London would survive the blow. The distribution of the Crystal Palace among various parks and the utilising of its site for a vast Indian Hall at the head of noble public gardens might, as an alternative, possibly solve another outstanding London problem. The early respacing of Piccadilly-circus is imperative, the delay in the completion of the embankment between the Victoria Tower and Lambeth Bridge inexplicable. The time has surely come for putting an end to piecemeal progress in the matter of bricks and mortar, and for the speedy realisation of the dreams of London lovers for the City Beautiful, the City Reproachless, the City Superb.

TOWN PLANNING.*

We have already seen that the corporate life is really a collection of individual lives all mutually dependent upon and acting and reacting on one another, and that this corporate life is undergoing a process of evolution towards a more completely fused condition. This process means the more perfect readjustment of every part of the civic life to every other part, a process of give and take everywhere, and entails a surrender of the rights of the individual in the interests of the whole. The more perfect the civic life the more complete is this subordination of the individual.

Communal life is only possible on the understanding that every individual is willing to subordinate his personal interests and surrender his private rights for the good of all. This is the basis of civilisation.

Now, in any state you find that every man in whatever part of the country he may live has to surrender certain rights or liberties—such as the liberty to steal from another or the right to exact private redress against those who steal from him—but beside this general agreement between ourselves which applies equally anywhere and everywhere, and is now the general law of the whole country, limiting our freedom in a general way only, you find that inside this general law that applies everywhere there are other additional and minor laws or by-laws which apply only in certain districts, limiting our individual freedom still further in those districts. These by-laws are the result of the growth of towns, and they represent the common agreement at which we have arrived as to the need of further curtailment of individual rights under the particular circumstances.

If a man wants to do as he likes, within the limits of the common law, he must live in an isolated spot in the country. In complete isolation he may freely develop his own personality and give expression to his own individual tastes, but the nearer he comes to the centres of population the more his individual tastes and habits must be restricted, till in the heart of a great city he loses all individuality in the corporate life, when everyones conduct approximates to uniformity and is governed by consideration for the general good.

This restriction of personal liberty is the price he pays for the advantages of the town.

You will notice, however, that not only are there purely voluntary restrictions in personal habits (such as costume and behaviour) and the restrictions by special laws—such as those affecting the speed of motor-cars—but also certain voluntary agreements between different classes of private individuals, such as landlords and tenants, which might be described as by laws in the making. For instance, in the country you can practically keep what animals you like on your premises, but in some suburbs you may not keep chickens in your garden; while in some London flats you may not keep a cat, or a canary, or even a musical instrument. These are all obligations voluntarily entered into in return for the advantages of the town, and are just examples showing how everything tends towards uniformity the nearer we get to the centre.

Now, this tendency to uniformity has an important and interesting influence over the general lay-out of a town and the treatment of its buildings.

As a complete town expresses the complete corporate life of its inhabitants, taken as a whole, so the house expresses the life of the individual. In the country where, as we have seen, a man's individuality develops freely, untrammelled by contact with his fellows, the house which expresses his life can also develop freely: if the owner is eccentric his house can be eccentric also, it can be any shape, size, or style he wishes, he has a building site free of all restrictions, he can do as he pleases—he is free to behave as he likes, and his house can express it. But the moment he comes towards the suburbs of the city restrictions begin. His own modified character and habits show themselves in his house—as he modifies his conduct out of consideration for his neighbours, influenced by their presence, so his house is modified, influenced by others. A certain degree of individual treatment remains, but a certain approach to uniformity is apparent. His site is restricted, and the nature and value of his house, a frontage line is to be observed, and a more stringent code of building by-laws. There may be no actual restriction as to architectural style, but even then the influence of the neighbourhood tends to present too much eccentricity in design, for he does not care to be laughed at.

When, however, we get into the centre of the town we find the complete absorption of his individuality in the corporate life expressed by the inclusion of his house in a terrace row of similar houses, whose uniformity of outward appearance expresses the general uniformity of his outward behaviour, costume, and appearance. The inner mental life of the man which retains its own personal individuality is expressed by the internal arrangements and decoration of his house, which can be as individual or even eccentric as may be desired, without offence to his neighbours. Such small differences of outward behaviour and personal characteristics as still remain would be expressed by the details of the front.

This seems to be the general principle that governs the treatment of houses in the mass.

* Extracted from a lecture by Mr. A. R. Jemmett, F.R.I.B.A., at the Westminster Technical Institute.

THE FOURTH REPORT OF THE WELLCOME TROPICAL RESEARCH LABORATORIES.

The events which led up to the occupation of the Sudan by the British authorities and to the rebuilding of Khartoum are so recent, and were of so dramatic a character, that they are familiar to everybody.

The results of that occupation have been, in many respects, remarkable. Civilising and educational influences have been brought to bear upon this region. Near the spot where Gordon fell in 1885 there now rises the "Gordon Memorial College," devoted to the training of the young; and as an integral part of it the "Wellcome Tropical Research Laboratories" were established some few years ago through the munificence of Mr. Henry S. Wellcome under the auspices of the Sudan Government Department of Education.

These laboratories, under the guidance of their able Director, Dr. Andrew Balfour, have been very largely concerned with investigations into purely medical problems. Tropical diseases, insects, animals, and sociological conditions have been the subjects of minute inquiry; but, as was to be anticipated from the thorough and practical character of this institution, the study of the conditions of health and disease has necessarily involved a study also of the familiar problems with which builders have to grapple in all parts of the world, namely, sanitation, drainage, water supply, and town planning. Upon these latter subjects the fourth report of the Laboratories, just issued, contains a surprising amount of information not otherwise available.

The provision of adequate water supplies for large towns in tropical regions can no longer be left to Nature and the natural processes filtration and purification which springs rivers undergo. In any large aggregation population the sources of contamination are numerous and the purifying effects of sun air too slow and insecure.

When the question of an improved w supply for the growing city of Khart became urgent it was evident that two sou were available—(1) The river, by taking supply above the town; (2) deep wells, if could be obtained.

A trial boring was sunk at a selected above the town and close to the southern b of the Blue Nile, and seven deep wells sunk. Unfortunately, the abundant su tapped by the wells was found to be serio polluted. The source of pollution was, howe located, and the trouble remedied by cut off the upper strata with cement. The were lined with a casing-tube of 9½ in. diam A second tube of 6⅝ in. diameter was pa down each well to the depth where it desired to cut off the upper strata. This i tube descended in the open borehole below level of the outer tube. In order to facili operations the well was first of all filled sand to provide the necessary cushion. Li cement was then poured between the two t down to the depth desired, and in cases w it did not settle properly it was blown d and packed by means of compressed air. set, for the most part under water, and for a hollow column of impermeable subst which entirely prevented contamination the Blue Nile water through the po travertine and sandstone stratum.

One fact which has been realised in conne with buildings for white men under tro conditions is the necessity for protection ag light as well as against heat. The na pigmentation of the negro's skin cuts off t light rays, but the European requires additi protection, and the means for effectu darkening the house form, therefore, important desideratum.

The erection of a model bungalow at Gordon College has afforded an opportu of testing certain ideas which had been evo as the essentials of a white man's residence i Sudan. The points referred to were as follow

(*a*) The walls should be protected from sun by verandahs, especially if they ar brick or stone; and, if not so protected, sh have as few openings as possible.

(*b*) Verandahs should not be less than 1 wide—preferably of timber as being cooler brick or stone—brought down to within 4 ft. to 7 ft. above the floor level, with a space between roof covering and lining, ventilated at the top.

(*c*) Roofs of houses and verandahs shoul thick enough to stop both the heat and rays, and be lined if constructed of timb

(*d*) Rooms should be arranged as fa possible so that each gets a share of the preva winds.

(*e*) Colours should be employed to whic eyes are naturally adjusted—such as the gr dark yellows and browns, white being avo especially for outside decoration, as the from it in the tropics is terrible.

In the chapter on "Some Muni Engineering Problems in the Tropics" exceedingly useful notes are to be found de with the difficult problems of sanitation, disposal of sewage, and the provision of p latrines in a large town of mixed popula It contains also the building regulations o town of Khartoum.

The "conservancy" method of se disposal has been adopted at Khartoum, a being worked very successfully in conne with a sewage farm and a refuse destr outside the town.

These two volumes contain many diag and much novel information concerning in the tropics, and are of special interes builders, architects, and sanitarians. They well repay study by all whom work or inclin beckons towards the Equator.

THE "TOWN PLANNING REVIEW."

The *Town Planning Review* continue maintain its high standard. The third nu of Vol. II. begins its editorial comments an illustrated discussion of Professor Adsh suggestions for improving Hyde Park C as a site for the King Edward Memorial.

Editor as to the use of the term "Land-
Architect," and to deprecate any attempt
ate an artificial distinction between the
of a building and that of its placing or
nment, the two things being, in our
n, but parts of one problem. If architects
concentrate more on the essentials of
work the æsthetic aspects of both sides of
roblem should not be beyond their scope.

CIVIC DESIGN NOTES.

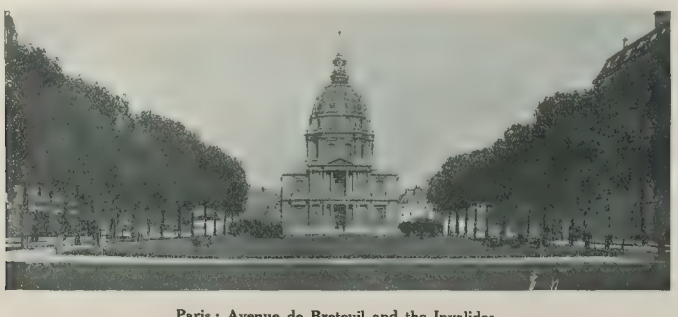
The Great Western Roadway. All who have occasion to travel to the West of England by road will follow with keen interest the proposal to project Cromwell-road through Hammersmith to Brentford and Hounslow. Such a road is one of the pressing necessities of London, and if, through the co-operation of the Road Board with the several local authorities concerned, the scheme can be brought to fruition it will be a work of abiding importance. While the subject of road cutting and the widening of existing thoroughfares is under consideration the architectural possibilities must not be overlooked. The cost of the actual highway is estimated to cost about 1,750,000*l*. To bring forward any ambitious scheme of building at the present moment would be to court failure, but the magnificent opportunity to put modern theories into practice should not be neglected in due season.

St. George's Hill Estate, Weybridge. A company is formed to develop this estate of nearly 970 acres, which commands fine prospects in one of the most beautiful parts of the county. The scheme provides for the erection of houses, to consist chiefly of large residences to cost from 2,000*l*. to 10,000*l*. apiece, for a golf course of 160 acres, and a sports ground of 10 acres. Forty acres are set aside for roads, walks, drives, and rides, and the ancient earthworks and the rhododendron valley will be preserved. A novel feature of the planning will be presented by the common kitchen-garden, with orchard, vineries, and greenhouses, for the growing of produce for all the tenants, which obviates the spoiling large areas of woodland by forming a separate kitchen-garden for each house.

Slum Areas, Nottingham. The City Council have ratified a scheme for expending about 140,000*l*. in clearing away what is regarded as the worst slum area in the town, which includes thirty seven squalid streets, and 600 houses inhabited by nearly 2,000 people. Some statistics presented by Dr. Miller, Chairman of the Housing Committee, show how great is the death rate in that quarter as contrasted with the rates in other parts of the City.

A Sports Ground for Guildford. Sir Harry Waechter, who was High Sheriff of Surrey last year, has bought from Lord Onslow and presented to the Corporation of Guildford the local sports ground, 8 acres in area, for its continued use for recreation and for purposes of military manœuvres by the Territorial or National Reserve Forces.

A Park for Eastbourne. A specially-appointed Committee have recommended the acceptance of the Devonshire Park Company's offer to sell the park to the Eastbourne Corporation for 110,665*l*. The Duke of Devonshire gives 10,000*l*. towards the purchase-money, and will reduce his interest in the company from 16,000*l*. to 23,000*l*.; he also offers the interest on the balance of 13,000*l*. towards the provision of an orchestra conditionally upon the levying of a penny rate for purposes of the band.



Electric Railway Bills (London) in Parliament. The Select Committee of the House of Commons, of which Sir L. White is Chairman, have ordered to be reported to the House the London Electric Railway Bill for extending the Baker-street and Waterloo Tube line from Paddington to the London and North-Western main line at Queen's Park, and the Edgware and Hampstead Railway Bill for extending the Charing Cross Tube line from Golder's Green to Edgware, with an amalgamation of the undertaking with the London Electric Railway Company.

Popularising the T.P. Act. "What Town Planning Means" is an excellent little pamphlet by George L. Pepler, F.S.I., published by the Garden Cities and Town Planning Association at the price of 1d. It points out in a concise and popular manner just what benefits seem to be obtainable under the Act. It is divided into two main sections—what a Council can do, and what an owner can do. Under the first heading it shows the possible scope of operations, and what a Council can do by making use of its powers, what its position will be if it does not make use of them, what it will cost, and what ought to be done at once. Under the second heading it points out the present position of the owner, the possibilities opened up by the Act, and how the Act works from his point of view, whether the local authority does or does not prepare a scheme.

This pamphlet seems admirably adapted to awaken interest in the Act on the part of all those concerned, and we hope it will obtain a wide circulation.

Colley Hill, Reigate. The National Trust make appeal for 2,000*l*., to meet a conditional promise of 1,000*l*., so as to provide the 3,000*l*. which is required to secure this charming stretch of 60 acres of the Surrey North Downs, rising to 700 ft. above sea level, and traversed by the Pilgrims' Way, from spoliation. The executors of the vendor, Mr. George Taylor, have agreed to extend for a short time the option of purchase at a price of 7,700*l*. The offices of the Trust are at 25, Victoria-street, S.W.

Widening of High Holborn. Negotiations are opened by the Holborn Borough Council with the London County Council in the matter of widening the street, on the south side, between the Inns of Court Hotel and the Holborn Empire Theatre concurrently with the erection of the new premises for the Pearl Assurance Company

Paris: Avenue de Breteuil and the Invalides.
(From the *Town Planning Review*.)

THE BUILDING TRADE.

THE IDEAL BUILDER.

WE have often heard it remarked, as a kind of protest against attaching too much importance to external circumstances, that the personal element is the determining factor in making or marring a man's success in life. This is undoubtedly so in relation to the building trade, although it may not be obvious to everyone; and it will have been realised by anyone who has met the ideal builder. What is the ideal builder? it may be asked. He is the man with a good all-round practical knowledge of every trade comprised in his work. He not only wishes to produce good building, but is competent to see that it is produced; and this applies equally to work that is hidden after completion and to that which always meets the eye. He is the man *par excellence* whom an architect would select —clients permitting—to give effect to his designs.

There are, happily, many builders who come near to the ideal standard; there are many who fall short of it in some degree; and there are some who may be said to miss it altogether. Imagine the head of a firm who has bought his way into a business from which older men approximating to the ideal type have retired or been removed by death. He owes his knowledge solely to a counting-house training, and, with the best intentions, cannot bring the fruits of practical experience to bear upon the work which is undertaken in his name. It might perhaps be asked, How should his ignorance affect the quality of the work, provided that he has competent men to act under his directions? Well, experience shows that such a man's control is not only ineffectual; not only is he liable to be deceived by those who work nuder him, but he will, himself, still, we say, with the best intentions, frequently obstruct the carrying out of thoroughly sound building work.

The personal element comes largely into play in the character of a builder's foreman. A capable and conscientious foreman will not allow bad work in any part of a building. His men are quick to learn the character of the person whose eye may be upon them at any moment. They, being paid by time, have nothing to gain by hurrying or scamping their work; and so a good foreman's task is an easy one, provided that he is not subjected to undue interference. On the other hand, when the foreman happens to be a "hustler," the result must be that much bad work is put into the building, especially in such matters as foundations and underpinning, which are soon to be concealed from view. The architect cannot possibly see every brick laid, and he must, in the absence of a clerk of works, rely largely upon the builder's foreman. Now if the builder is one of those men who fall so far short of the ideal standard as to have scarcely any practical knowledge of building, he will usually judge only by financial results. He will find that, where the foreman was a careful, conscientious man, the job did not pay so well as in another case where the foreman was a "hustler," and often has a good foreman been made to realise that he must "either hustle or get the sack." In the end he will be compelled to pass bad work, and the men will take their cue from him. Thus the personal influence of the head of a firm extends downwards to the poorest labourer in his employ.

As with the foreman and his master, so it may be with the managing director, who possesses a thorough knowledge of building work, and a Board to whom he stands accountable and who view affairs solely from the financial standpoint. He, poor man, may become a "hustler," much against his own will; he who has perhaps converted his business into a limited liability company may find himself, like Frankenstein, overmastered by a monster of his own creation.

Many of our readers are aware that the evils to which we refer have been on the increase for many years past. They are mainly the result of that feverish race for wealth which acts prejudicially to high ideals and goes far to ruin modern society. We see the causes of disease in operation. Whence, we may ask, is to come the remedy?

The cry has often been raised, especially in regard to building, that men no longer take pride in their work; they do not, we are told, love it for its own sake, as did the workmen of the Middle Ages. But it cannot be maintained that this is so with the majority of builders at the present time. Every day may be found instances to the contrary. True, we have not so many firms now whose heads have risen from the bench as were in existence, say, forty years ago. But the principle of survival of the fittest holds good, and must ever do so. In judging of building firms the personal element will always influence an architect's decision, and he will cast a favourable eye upon those approximating most nearly to the ideal standard. Thus the steady-going practical builder will be selected, when possible, in preference to the mere financier, and, though he may never become a millionaire, will hold his ground ultimately, neither playing for high stakes nor risking a stupendous disaster. The need for a sound practical training before attempting to enter the building trade if not recognised in advance may be learnt by unwelcome experience. The control of large firms by men who lack the necessary qualifications will sooner or later show itself to be unworkable. Meanwhile, young architects may be advised to exercise the closest discrimination when selecting builders to tender in competition.

THE "CEMENT GUN."

An appliance first used on a large scale in building work for renovating the exterior of the World's Fair pavilions in Chicago, the so-called "gun," has been widely used in the United States and will probably find its way into this country as an American novelty, despite the fact that the same principle has been applied for many years past in painting and limewashing machines made by British firms. The cement gun, or spraying machine as we should prefer to term it, consists essentially of two vertical cylindrical chambers one on top of the other. The upper chamber is fitted with an inlet valve at the top and there is a similar valve between the two chambers, which are used for the reception of cement and sand in given proportions, and are provided with hand-worked beaters used for breaking up any lumps. At the bottom of the lower chamber is a flat wheel with deeply cut teeth, the wheel being rotated by a small air motor so as to carry a small quantity of the dry materials into the air current of a blow pipe and thence into a flexible hose terminating in a nozzle where water is added in the form of spray from a small independent hose pipe.

Leaving the nozzle at a velocity of 300 ft. per second the mortar deposited is denser and stronger than ordinary stucco, and it is claimed that as hydration takes place in transit immediately before and during the application of the mortar, the process of setting is not interfered with as occurs in mortar applied by hand.

In building construction the spraying machine has been used for coating steelwork, forming exterior and partition walls based on wire netting or tarred paper covered with netting, stuccoing timber and other houses, building fences, and for other classes of work where cement mortar is commonly employed.

LAND VALUATION.

The Land Union announces the decision of the Official Referee under the Finance Act in the celebrated "Richmond Case." This was a case which gave rise to some comment, and questions were asked in the House of Commons about it. Some ladies inherited in 1910 a small dwelling-house and shop in Yorkshire. This property had been purchased by the father of these ladies for 500*l*., but the date of this purchase is not given in the report. The ladies paid death duties on 500*l*., and subsequently sold the property for 500*l*. The property was, however, valued as for purposes of the Finance Act as being of value of 380*l*. on the date fixed by the A April 30, 1909, and thus on the sale 22*l*. claimed as increment value duty. The la had neglected to appeal from this valuat within the prescribed period, and it was favour, after questions were asked in House, that the matter was allowed to reopened by appeal. The Referee has rai the total value by nearly 20 per cent., fix it as on April 30, 1909, at 466*l*. 15s. Th if all the difference between this valuat and the price realised by sale is attributed increment, the amount of the duty will 5*l*. and not 22*l*., but it remains to be pro whether the site value has in fact increa in value.

In another case, the "Palmer's Green Cas recently reported by the Land Union, it been held that a small profit realised on sale of a leasehold property was not subject of increment value duty, as there no increase in the site value.

That hardships occur under the Act da is common knowledge, as many persons can afford to appeal, but the point we now w to draw attention to is the lack of publicity being given to the decisions of Referees. Unless there is a further appeal the High Court the public have no knowle of the course that is being pursued under Act, and individuals may be paying ta levied on a basis which has been held to erroneous. The appeals to Referees t appear in no way to simplify the administ tion of the Act. The public are m indebted to the Land Union for the cou they are taking in publishing the decisi of the Referees.

THE LONDON ASSOCIATIO OF MASTER DECORATORS

A meeting of the General Committee v held at the offices, 92, Queen Victoria-stre E.C., on the 11th ult., Mr. C. E. Wilkins in the chair.

Trades Disputes Act.

The Secretary read letters received fr the Employers' Parliamentary Council, Prime Minister, and the Trades Disputes Reform League, and presented a copy of proposed Bill. He explained that he written to the Prime Minister, submitting t a deputation should be allowed to wait u him, and the letter read was the reply to t request. The Prime Minister regretted inability to receive a deputation.

The Chairman said that the only thing Association could do was to support the B using what influence it had with Parliament representatives.

The Secretary said he had asked in w way the Association could support the F ployers' Parliamentary Council, and he r read the reply received.

The Chairman said that reply could not acted upon, but he thought the Bill had unanimous support of the members.

The petition was passed round the Co mittee and signed by the members.

Mr. Dakin suggested that the Associati should signify its willingness to support Bill and should say that, as Australia h shown the way, England ought not to m taking the hint and doing the same.

Mr. Anderson thought it would be well send a resolution to the London Mas Builders, which they could attach to memorial when they sent it in, and a let might be sent direct to Lord Claude Hamil to the same effect, unanimously supporting recommendations.

Mr. Anderson thought that was all t could be done at the moment. The Secret might be instructed to write to the Mast Builders' Association, saying that the membe present at the Committee meeting that ev ing had signed the petition, and cordia endorsed the action they were taking in t matter, and sent another resolution to L Claude Hamilton, informing him that matter had been discussed by the Committ which was unanimously in favour of the B he was promoting.

This was agreed to.

Anderson said it might be wise in writ- Lord Claude Hamilton to ask him in ay the Association could further assist l. It might be that a memorial could arded on the part of the Association next general meeting.
was agreed to.
Dakin considered that it should be sent o the other members of the Association get as many signatures as possible.
Chairman thought the petition might brought up at the general meeting ned there. He did not think it was ely necessary that it should be signed members of the Association.
Anderson said the Secretary might some memorial sheets for circulation.
Dakin suggested that a member of the tee in each district might have a get signatures.
Chairman agreed. As long as those who were employers or masters, it did not to matter whether they belonged to the tion or not.

ndon County Council Education.

Committee proceeded with the con- on of the letter from the London Council on the subject of technical on.
Anderson said that as there were several s asked, which were more or less out- e Report submitted to the County it would be better to have the matter i to three or four members of the ional Committee.
Chairman said one or two questions were n the letter, which might be answered General Committee at once. For , names of firms represented on the tion who were prepared to guarantee ment to boys on the completion of ourse of training, and the names of ho would take the boys, were questions ight be answered straight away. He it might be said that all the firms in sociation would take them.
Anderson said there was no definite from firms. To say how many boys e taken each year was rather a big He did not know that a guarantee e given that any firm would take a h year, because in four or five years uld mean four or five boys, and the as whether the firm could keep those ing.
Dakin thought that was a question could hardly be answered until the s had been written to for their views subject.
Milton asked whether it would not be say that each firm would take one or A boy might not stop. He might get e of something better and might leave, might misbehave himself and be dis- .
Chairman thought there would have to cular letter to the members before the could be answered.
Anderson said the whole matter might rred to a Sub-Committee of three to ith. They could draft a form which o out with the notice of the general . It might be a means of bringing a the general meeting. This was agreed on the motion of Mr. Milton, seconded Rowden, Messrs. Anderson, Wilkinson, kin were appointed the Sub-Committee.

nants' and Manufacturers' Terms to the Public.

Secretary read a letter from the l Federation of Builders.
Anderson said the only thing the Asso- had done was to induce the principal er manufacturers not to supply the direct at all except at gross prices. could not prevent a merchant from ng a private individual, if he was pre- o do it, at gross prices.
Chairman thought it might be said that rts of the Association in the past had ith considerable success in obtaining ts for the trade.
Anderson said in the circular Messrs. on's sent round they said they would not the public at all except through a or.
Dakin said that was the only firm who hat statement in writing. Most of the firms said they had always taken that d intended to continue to do so.
Anderson said that Messrs. Sanderson & rote to some 5,000 architects stating uld not in future supply them with but any goods they required must come a decorator. There were other firms d declined to allow discount to any individual except a small cash .

Mr. Dakin said an arrangement had been come to with the Wallpaper Manufacturers, Ltd., that in future there would be no public advertisement of a discount off wallpapers such as that which, up to that time, had been put in the windows of Whiteley's, Maple's, and similar firms. That was stopped through the agitation of the Association.

Mr. Anderson thought that was the agreement with most of the larger houses, that, provided it was general, they would agree not to exhibit advertisements with reference to discounts on paper.

Mr. Dakin said it was further suggested at that time by Messrs. Sanderson's, Lines, and several others, that in order to assist in carrying out the arrangements decorators ought not to deal with firms who gave more than a third discount off ordinary orders.

The Chairman said the reference in the letter was to merchants and manufacturers supplying the public with goods on trade terms, and the Association were asked what they were doing in the matter, and in what way the Federation could help the Association or the Association help them. He thought the reply might be that the Association were taking the matter up whenever they received information, and had been successful in dealing with the firms.

Insurance Act.

Mr. Dakin said that with reference to the Insurance Act, he had been in communication with various members of the Committee asking them to form a Committee to consider what the action of the Association should be in regard to the Act, and he had received replies from the Chairman, Mr. Rowden, Mr. Campbell, and Mr. Anderson, in favour of uniting with him to go into the pros and cons of the Act to see how it affected the employers in the decorating trade. By the time the quarterly meeting came along that Committee ought to have a concise form of objections to the Bill, and be able to say what procedure should be recommended to the Association, subject, of course, to the general meeting's approval. Part II. of the Act, dealing with unemployment, was rushed through the House with only eight or nine provisions discussed out of twenty-five. He failed to see that employers could submit to an Act passed in such an unconstitutional manner. He was strongly of opinion that the Association ought to be brought, if possible, to agree to object to the Act by making themselves passive resisters to the demand of the fees until such time as the Act met the views of the employers and of the working classes, who were affected by it as much as the employers.

The Chairman said unless there was resistance there would be no amendment.

The Secretary said that when the notice for the general meeting went out it might be stated that it was the intention to take the opinion of the Association on the Act at the meeting, and those who could not be present might be invited to send their views.

The Chairman agreed, and said at the same time it might be mentioned that the Report would be brought forward at the Special Committee.

Continuous Certificate of Discharge.

The Secretary submitted proof certificates, samples, and estimates of costs in connexion with the proposed continuous certificate of discharge.

On the motion of Mr. Rowden, it was agreed that the word "employment" should be substituted for the word "engagement" in one of the headings.

Mr. Dakin suggested that a larger number of entries should be allowed for on the cards.

Mr. Mellis suggested that the coat of arms of the Association should be on the outside of the card, and this was agreed to.

It was agreed that further estimates should be obtained from other firms for 1,000 or 2,000 cards.

Mr. Anderson said as soon as the card had been decided upon the Secretary should be instructed to write to a number of firms asking them to take the matter up, and saying the cards could be supplied at such-and-such a price, and also that if taken up it would be in the interests of themselves and of the men

TRADE DISPUTES ACT.

In the House of Commons, on the 25th ult., Mr. Peto presented a petition from 134 members of the London Master Builders' Association praying that the number of pickets during trade disputes should be limited to two, and that pickets should be permitted to attend only the place where a person worked or exercised his business, and that all unions should be made responsible for the acts of its members.

GENERAL BUILDING NEWS.

CHURCH REPAIRS, NEWPORT, MON.

The report and plans of Mr. G. E. Halliday, F.S.A., of Cardiff, for the reparation and enlargement of the historic Parish Church of St. Woolos, Newport, Mon, have been adopted by the Vicar, the Rev. D. Griffiths, and Committee. The work is estimated to cost about 6,000*l.*

CHURCH, PORTHCAWL.

A new church is about to be erected at Porthcawl, Glam, to seat 600. Tender for the first section, to cost 4,500*l.*, has been accepted. The architect is Mr. G. E. Halliday, F.S.A., of Cardiff. The total cost is estimated at 6,500*l.*

ENLARGEMENT OF CHURCH, ABERDARE.

The extensive enlargement of St. Elvan's Church, Aberdare, Glam, has recently been completed at a cost of about 6,000*l.* from the designs of Mr. G. E. Halliday, F.S.A., F.R.I.B.A., of Cardiff.

COWBRIDGE PARISH CHURCH.

The report and plans of Mr. G. E. Halliday, F.S.A., for the reparation of Cowbridge Parish Church, Glam. at a cost of about 3,000*l.*, have been adopted by the Vicar and Churchwardens.

ROMAN CATHOLIC SCHOOL, MOORTHORPE.

This school has been erected at a cost of about 2,000*l.* from the designs of Mr. J. H. Eastwood, A.R.I.B.A., architect, of London. The contractors for the work were Messrs. Swift Brothers.

NEW SCHOOL, CHESTER.

Mr. Fairclough, of Warrington, was the builder of the new city and county school in Queen's Park, Chester, which has been erected from the designs of Mr. W. T. Lockwood, architect, of Chester. The new building contains a central hall, 46 ft. by 35 ft., and laboratories.

THE ADELPHI HOTEL, LIVERPOOL.

The hotel has been reconstructed from the plans prepared by Mr. Frank Atkinson F.R.I.B.A. The new building consists of nine floors, is 120 ft. above the street level, and includes a French restaurant, Hypostyle hall, and a ballroom.

TRADE NEWS.

Under the direction of Mr. Fred Howorth, architect, Preston, Boyle's latest patent "air-pump" ventilators have been supplied to Fulwell Wesleyan Church, Preston.

The Houghall new Infectious Hospital, Durham, is being supplied with Shorland's warm-air ventilating patent Manchester stoves by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

Owing to the increase of London business, Messrs. Richard Johnson, Clapham, & Morris, Ltd., appointed as their agent Mr. H. M. Kelk, who has now removed to larger and more convenient offices. In future his address will be 42 and 42a, Broad-street House, New Broad-street, E.C. Telegraphic address: "Crossways, London." Telephone No.: 6183 London Wall.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ACCRINGTON.—Ice-making premises, Argyle-street, for the Blackburn Crystal Ice Company, Ltd.

Banbury.—Workmen's dwellings; Messrs. Lucas & Lodge, architects, Hart-street, Bloomsbury, W.C.

Barrow.—School; Mr. A. Race, Surveyor, Town Hall, Barrow.

Batley.—Weaving premises, for Messrs. Hall, Tankard, & Co., Brookroyd Mills.

Belfast.—Additions to Park Lodge, for the Earl of Shaftesbury; Mr. H. Beaver, architect, Donegal-square, Belfast. Lecture hall; Mr. S. Stevenson, architect, 83, Royal-avenue, Belfast; Messrs. R. Curry, Ltd., builders, University-street, Belfast.

Bolton. Nurses' home (4,500*l.*); Henderson & Brown, Fold-street, Bolton.

Bonnybridge.—Drill hall (2,500*l.*); Messrs. A. & W. Black, architects, 5, King's Arms-court, Falkirk.

Brymbo.—Drill hall for the Denbighshire Territorial Force Association; Mr. C. D. Rutter, architect, Parr's Bank-building-chambers, Wrexham.

Cambridge.—County offices (13,000*l.*); Mr. H. H. Dunn, County Surveyor, Central-chambers, Cambridge.

* See also our list of Competitions, Contracts, etc., on another page.

Castleblayney.—Convent school; Mr. J. I. McDowell, architect, 27, Chichester-street, Belfast; Messrs. R. Ritchie & Co., builders, 85, North Queen-street, Belfast.

Castlerock.—Golf hotel: Messrs. Davidson & Miller, Richmond-street, Londonderry.

Cathcart.—Queen's higher grade school; Messrs. Thomson & Sandilands, architects, Blythswood-square, Glasgow. Thirteen houses, Muirend-road, for Messrs. John Emery & Sons, Nursery-lane, Strathbungo.

Cheshire.—Tower at Sandiway Church; Messrs. Marshall & Muspratt, architects, Chester; Messrs. Clegg & Sons, builders, Chester.

Childer Thornton.—School (3,780*l.*); Messrs. A. Fleming & Co., builders, Neston.

Clydebank.—Library; Messrs. Gardiner & White, architects, Glasgow.

Colne.—Weaving-shed (800 looms) for Messrs. S. Greenwood & Sons, Colne. Additions to hospital; Messrs. Holgate & Spivey, architects, Lloyd's-chambers, Market-street, Colne.

Drogheda.—Fifty houses; Borough Surveyor, Town Hall, Drogheda.

Dublin.—Foresters' hall; Mr. W. A. Scott, architect, 45, Mountjoy-square, Dublin.

Dundee.—Additions, West Green Asylum (1,200*l.*); Mr. T. M. Cappon, architect, 32, Bank-street, Dundee.

Durham.—Drill halls, Barnard Castle, Gateshead, and West Hartlepool; Mr. Hy. Chapman, architect, Grainger-street, Newcastle-on-Tyne. Block to University (2,500*l.*); Messrs. J. Potts & Son, Eldon-square, Newcastle.

Easington Colliery.—School (10,275*l.*); Mr. J. Hedley, builder, Newcastle.

Edinburgh.—Shops and warehouses, Easter-road, and Causewayside-buildings (2,200*l.*); Mr. T. J. Marwick, architect, 43, York place, Edinburgh.

Flint.—School, Halkin-street (5,000*l.*); Mr. Sam Evans, County Architect, Mold.

Foleshill.—One hundred houses; Mr. W. McCarthy, builder, Ellys-road, Coventry.

Frodingham.—Alterations to iron and steel works (4,000*l.*); Mr. W. S. Walker & Son, 77, Lowgate, Hull.

Gainsborough. Electric theatre; Mr. W. O. Eyre, architect, 18, Silver-street, Gainsborough.

Glasgow.—Playhouse, Charing Cross (22,500*l.*); Mr. W. B. White, 219, St. Vincent-street, Glasgow. Buildings, Vincent-street, and West Nile-street (20,000*l.*); Messrs. Campbell & Hislop, architects, 124, St. Vincent-street, Glasgow. Alterations and additions to residence, Albert-road (2,000*l.*); Messrs. J. Hamilton & Son, architects, 212, St. Vincent-street, Glasgow. Restoration of flour mills, Centre-street, for Messrs. Wm. Primrose & Sons, Ltd.

Gloucester.—Fire-station; Mr. R. Read, Surveyor, Guildhall, Gloucester.

Halifax.—Premises, High-road (1,500*l.*); Messrs. Clement Williams & Sons, Halifax.

Hanley. Mining school, Victoria road; Mr. S. B. Ashworth, Town Hall, Hanley.

Harrogate. — Conversion of Town Hall theatre into mechanotherapeutic institution (980*l.*); Mr. F. Bagshaw, Engineer, Town Hall, Harrogate.

Hinckley. Hospital; Messrs. Walker & Heaton, architects, The Borough, Hinckley.

Ilkley.—Additions to King's Hall (3,000*l.*): Mr. T. H. Smith, Surveyor, Town Hall, Ilkley.

Irlam (Manchester).—Picturedrome; Mr H. Booth, 42, Regent-street, Haslingden.

Jarrow.—Additions to Palmer Shipbuilding Company's offices; Mr. B. Gowan, general manager, Palmer Shipbuilding Company, Hebburn-on-Tyne.

Keighley. Baptist Sunday school, Albert-lane; Mr. A. P Harrison, architect, High-field-lane, Keighley.

Laugho.—Additions to reformatory; Mr. H. Littler, architect, 16, Ribblesdale-place, Preston.

Leicester.—Church (15,000*l.*); Mr. W. D. Caroe, architect, 98, College-street, S.W.: Messrs. Collins & Godfrey, builders, The Cross, Tewkesbury.

Limerick Rebuilding St. Murchin's Church: Mr. B. E. F. Sheehy, architect, 57, George-street, Limerick.

Lisburn (Co. Antrim).—Erection of Brownlie Memorial School (2,500*l.*); Mr. Jas. Hunter, Beechwood, Antrim-road, Lisburn.

Littlehampton. — Fire-station: Mr. H. Howard, Surveyor, Town Hall, Littlehampton

Llanelly.—Additions, Liberal Club: Mr. J. Evans, architect, Llanelly.

Londonderry.—Orange hall (1,800*l.*); Messrs. Robinson & Davidson, architects, Richmond-street, Londonderry. Church (1,800*l.*); Mr. J. P. McGrath, architect, 6, Castle-street, Derry.

Maryhill (Glasgow).—Additions to rubber works of Messrs. G. MacLellan & Co.,: Mr. Geo. Simpson, architect, 233, St. Vincent-street, Glasgow.

Newbridge.—School; Mr. J. Bain, Architect, Shire Hall, Newport, Mon.

Newcastle.—Hospital at workhouse; Mr. E. Bowman, architect, Westgate-road, Newcastle; Messrs. Davidson & Miller, builders, Newcastle.

Newlyn (Penzance). — Wesleyan school (2,200*l.*); Mr. Jas. Madden, architect, Morrat-road, Penzance.

Newton.—Additions to school; Mr. G. Widdows, St. Mary's-gate, Derby.

Oswestry.—School; Messrs. Willink & Thicknesse, architects, 14, Castle-street, Liverpool.

Outwood.—Power station and house, Lingwell Nook-lane, for the Yorkshire Electric Power Company.

Peterborough. — Alterations, court-house; Messrs. Townsend & Nordham, architects, Peterborough.

Porthcawl.—Church; Mr. Halliday, Diocesan Architect, Castle-street, Cardiff; Messrs. Vicary Brothers, builders, Barry Dock.

Reading.—Manual instruction centre, Wokingham-road (720*l.*); Messrs. R. Bell & Sons, builders, Caversham.

Rhondda Valley. — Workmen's institute (3,000*l.*); Mr. W. D. Morgan, architect, Victoria-chambers, Pentre, Rhondda.

Rogerstone (Mon.).—Golf clubhouse (2,200*l.*); Messrs. Phillip & Vaughan, architects, Prudential-buildings, Commercial-street, Newport, Mon.

Sacriston.—Literary institute; Mr. G. T. Wilson, architect, Durham-road, Blackhill.

St. Asaph.—Additions to workhouse; Mr. J. Hughes, architect, Denbigh.

Shirley (Soton).—School (14,600*l.*); Messrs. H. Stevens & Co., builders, 126, Above-bar, Southampton.

Silverton (Devon). — Reservoir; Messrs. Montague Luke and Partners, architects, 9, Princes-square, Plymouth.

Skipton. Shops and offices, High-street (2,000*l.*); Mr. J. W. Broughton, architect, 19, High-street, Skipton.

Sligo. Operating theatre at infirmary: Mr. A. Murray, architect, 37, Dawson-street, Dublin.

South Bank (near Middlesbrough).—School (8,423*l.*); Mr. G. M. Radge, builder, Normanby, near Middlesbrough.

South Bank.—School (8,000*l.*); Messrs Bottomley & Wellburn, architects, 38, Albert-road; Middlesbrough; Messrs. C. Brown, Ltd., builders, West Hartlepool.

South Moor.—Picture hall; Mr. E. Dyson, architect, Pelton. Institute (4,000*l.*); Mr. T. E. Taylor, The Grove, Lanchester, Co. Durham.

South Shields.—Block to workhouse (2,600*l.*); Messrs. J. H. Morton & Son, architects, Eastern Bank-chambers, South Shields.

Spennymoor.—Council offices, public hall, and market (15,000*l.*); Mr. G. T. Wellburn, architect, 38, Albert-road, Middlesbrough.

Springwell.—Extensions to premises of Windy Nook Co-operative Society (3,000*l.*); Messrs. Davidson & Miller, builders, Newcastle.

Stoke-on-Trent.—Fire-station (1,800*l.*); Mr. A. Burton, Surveyor, Town Hall, Stoke.

Stonehaven.—Alterations, premises, High-street, for Messrs. J. Jack & Sons, Ltd., net manufacturers.

Stonehouse (Plymouth). — Police station (4,000*l.*): Mr. E. H. Harbottle, architect, The Castle, Exeter.

Strood (Kent).—Premises, Gun-lane, for the Rochester and District Co-operative Society.

Sunderland.—Church hall (2,000*l.*); Messrs. W. & T. R. Milburn, architects, Fawcett street, Sunderland.

Swadlincote.—Extensions to Pottery Works for Messrs. T. G. Green & Co.

Swansea. -Fifty houses, Cwm-road (6,375*l.*); Messrs. J. Marles & Sons, builders, Swansea. Fifty-three houses, Trewyddfa Common; Mr. A. J. Colbourne, builder, Swindon. Plans have been passed as follows: -Rebuilding premises, Woodfield street, Morriston, for Mr. L. B. Lewis; warehouse, 26-7, Orange-street, for Swansea Co-operative Society Company, Ltd. A plan has been lodged for four houses, Quar-road, Landore, for Messrs. Hughes & Morgan.

Taunton.—School, Priory Estate (5,880*l.*); Messrs. G. Pollard & Son, builders, Taunton

Tavistock. -Isolation hospital: Surveyor, Urban District Council Offices, Tavistock

Tibshelf -School (5,000*l.*): Mr. G. Widdows, architect, St. Mary's-gate, Derby.

Tiverton.—Drill hall: Messrs. Ellis & Bowden, architects, Bedford-circus, Exeter.

Troon.—Picture theatre. Portland-street: Mr John Wilson, Brandon-street, Motherwell.

Trowse.—Six houses, etc., Whitlingham Farm (2,430*l.*): Mr. A. E. Collins, Engineer, Town Hall, Norwich.

Upper Penn (Stafford). — School: Mr Hutchings, Education Offices, Stafford.

Ushaw Moor. -Picture hall; Mr. Storey, architect, Cornsay Colliery.

Wattstown.—Two hundred houses: Mr. W. J. Jones, Surveyor, Town Hall, Rh Glam.

Willing (Co. Durham).—Hospital (7 Mr. J. H. Gardner, Surveyor, Council Willington.

Winton (Bournemouth). — Congreg church (5,000*l.*); Mr. J. Donkin, ar 58, Portchester-road, Bournemouth.

Witham.—Fire station and isolation ho Mr. W. P. Perkins. Surveyor, Urban Council Offices, Witham.

Wolverhampton.—Additions, Horde school; Messrs. Fleeming Brothers, arc Bank-chambers, Wolverhampton. Ad to Moorfield Works for the Sunbeam Car Company, Ltd.

Wooler.—Improvements at St. Mary's (2,000*l.*); Mr. A. B. Plummer, architect castle; Mr. G. Beattie, builder, Woole

Worcestershire. Mission hall, Dart road, Selly Oak; Alfred J. Dunn, F.R. architect, No. 1, Waterloo-street, Bi ham; Messrs. Thomas Loud & Sons, b Selly Oak.

Worstholme (Burnley).—School; M Littler, architect, 16, Ribblesdale Preston.

Yarmouth. — Additions, infirmary (5, Mr. A. S. Hewitt, architect, Regent Yarmouth.

Yeovil. — One hundred houses; Mogridge & Sons, builders, Queen Taunton.

Yoker.—Electric sub-station off Fer for Bull's Metal and Melloid Company,

FOREIGN AND COLONIA

Labour in the Colonies.

From the Emigrants' Information 34, Broadway, Westminster, S.W., w received the April circulars of the Emi Information Office, from which we lea in *New South Wales*, in Sydney and s the building and iron trades, the sawye factory workers, have been well emp and stonemasons, bricklayers, brickn plasterers, carpenters, and joiners, an bodied labourers are in great dema *Victoria* employment continues to b good, and assisted passages are now granted to mechanics under forty-five y age. There is a large demand for pla boiler-makers, blacksmiths, moulders, plu sheet metal workers, and electric light -*South Australia* grants cheap passa emigrants. Work of nearly all ki plentiful, and a large amount of m being spent on public works. There is demand for bricklayers, masons, pla carpenters, plumbers, ironworkers, finishers, coppersmiths, engineersmiths, ar and shovel men.—The *Queensland* Gove grants nominated passages to emi There has been plenty of employment f kinds of mechanics.—In *New Zeala* demand for mechanics is not general, building trades have been busy nearly where, and carpenters and joiners, brick plasterers, plumbers, gas-fitters, and b trade labourers are wanted in many The engineering trades have been fairl but the supply of men is generally suffi In the *Union of South Africa*, employm the building and other trades in Johan continues fairly active; but the supply is quite sufficient.

Extensions and Improvements in Rio de J

According to the *Messager de São* towards the end of last year Dr. J. Alencar Lima submitted to the author Rio de Janeiro comprehensive plans embellishment and improvement of th Provision is made in the plans for construction of six new large avenue four large streets, the object being them up with the main avenue leading docks, and thus facilitate commun between the suburbs and the in quarters; (2) the erection of 7,000 bl residential flats capable of accomm 300,000 people, as well as workmen's te for the accommodation of 20,000 indiv (3) the laying of extensive undergroun for draining the soil of torrential rai (4) the carrying out of sewerage wor demolition of old quarters, the const of quays and squares, and the laying gardens, &c. Commenting on this rep British Acting Consul-General at Janeiro (Mr. E. Hambloch) states considers it unlikely that the scheme passed in its entirety, although part may materialise, as has happened in t of similar projects presented in recent Ultimately, he adds, it will be found sary in the interests of the city to ca in full, changes similar to those now pr

IE NATIONAL PHYSICAL LABORATORY.

the occasion of the presentation of the ual Report of the General Board of the onal Physical Laboratory on March 15 invited to be present had an opportunity specting the various departments of this useful institution, accommodated partly ie fine old brick-built mansion known as y House, and to a far more considerable rt in the new buildings that have been ed in the grounds.

the Thermometry Department are the gas nometer-room, with a thermometer fulfilling duty of an ultimate high temperature lard up to 1,200 deg. C., apparatus for deter- ng the sof ening points of refractory rials, a potentiometer and electric furnace hermo-couple comparisons, and two furnace- s, one with appliances for the verification gh-range standard mercury thermometers, atinum melting-point furnace, resistance- nometers and pyrometers, and the other shed with electrical furnaces of various . Other rooms in the same department ccupied by equipment for testing mercury nometers, flash-point apparatus for testing leum and lubricating oils, liquid air plant ow-range temperature verification, and ratus for the determination of thermal activities of heat insulators.

e departments devoted to general electrical urements and electrical standards are rably equipped for the many delicate tests measurements demanded in connexion this important branch of physical science, he Optics Department, devoted to tests of graphic lenses, microscopes, and general al apparatus and materials, is one of much est.

separate building accommodates the rotechnics Division, including the Electro- ical and Photometrical Departments.

xt in order comes the Engineering Depart- , under the direction of Dr. Stanton, where quipment for testing structural materials des horizontal and vertical testing machines, half-dozen impact testing machines, e testing plant, and research apparatus. latter comprises experimental channels for mining the resistance of plates and models iform currents of air and water, respectively, ratus for determining the specific heat eam, the rate of heat transmission from l surfaces to gases in contact with them, epeated load tests on reinforced concrete s, and percolation tests on concrete . In the grounds there are two experi- al towers 60 ft. high, with revolving rms 20 ft. long, for the study of wind- ure on structures.

new building belonging to the Engineering rtment has recently been erected and pped for testing the endurance of road ces and materials used in road construction. e Metallurgy Department, under the direc- of Dr. Rosenhain, is now housed in the Wernher Building, with laboratories for llurgical Chemistry. The main building sts of a two-story block, measuring 100 ft. ft., with a workshop and foundry attached, onnected by a single story extension with chemical laboratories. The ground floor voted principally to the cutting, grinding, ning, and etching of metal sections, and subsequent examination and microscopic graphy. The workshop, formerly used e Standard lathe-house, will be equipped testing machines and machine tools, and oundry provides for casting and handling ls in comparatively large quantities. The ical laboratories include rooms and ratus for steel analysis, alloy analysis, ical work on cement and road materials, o-chemistry, gas analysis, and spontaneous ustion research.

e Metrology Division is housed in a separate ing, designed to meet the requirements of ancy of temperature for the main measuring s, to provide a long corridor suitable for neasurement of tapes, and to provide the site workrooms, offices, and accommoda- or special warming plant. The eight main s are of the double-shell type, the walls louble glass ceilings being entirely within uter walls and roofing, and the temperature aintained at uniform level by automatic al regulators. Among the chief appli- in this division of the laboratory are the swood ruling-machine, the 50-metre arator for measuring tapes and wires, comparators for line standards of length and the calibration of scales, comparators for the accurate comparison of end standards of length, the Pratt and Whitney measuring-machine, Dr. Shaw's electric contact measuring-machine, Whitworth measuring-machine, screw and nut measuring-machines, standard scales gauges and templates, standard screw-cutting lathe, and other apparatus too numerous for individual mention.

The William Froude National Tank, 550 ft. long by 30 ft. wide by 12 ft. 3 in. deep, is constructed in a special building, where also is a smaller tank, 63 ft. long by 5 ft. wide by 3 ft. 3 in. deep. Although shipbuilding may not come within the professional practice of our readers generally, these tanks and their equipment are of extremely interesting character, and will thoroughly repay detailed inspection.
